DESCRIPTION OF THE EPIDEMIOLOGICAL SITUATION

For detailed evolution of Respiratory Radar indicators, see appendix

For detailed results of the surveillance of respiratory infections, see the bulletin [\[NL / FR\]](#)

- Syndromic surveillance of consultations for **Influenza Like Illnesses (ILI)** at the **General Practitioners** shows a strong increase and is in the red level. In particular, the number of consultations for ILI among children under 15 is very high and increasing.
- Syndromic surveillance of **ILI at Nursing Homes** shows an important increase and is in the red level.
- Syndromic surveillance of **hospitalizations for SARI** shows an important increase in the last week (week 3), and is in the orange level.
- The circulation and impact of **SARS-CoV-2** remains low in all surveillance systems.
- **RSV**
 - Wastewater surveillance: stable but elevated number of stations where RSV is detected.
 - Laboratory surveillance: decreasing number of positive tests over last weeks. The number of positive tests remains elevated among 65+.
 - SARI surveillance: slight increase in number of hospitalizations (week 3), after multiple weeks of decrease.
- **Influenza**
 - Wastewater surveillance: very high and increasing number of stations where Influenza is detected.
 - Laboratory surveillance: slight decrease in number of positive tests, but continued increase among children under 15 (week 3, not fully consolidated).
 - GP surveillance: high and increasing number of consultations (week 4).
 - SARI surveillance: high and increasing number of hospitalizations (week 3).

EPIDEMIOLOGICAL LEVEL

ORANGE

The epidemiological level of respiratory infections in Belgium is maintained at the orange level.

While the current epidemiological situation does not warrant an increase to the red level, experts stress that the situation is not stable. The increases observed in multiple indicators, notably indicators of circulation in the general population, suggest that a further deterioration is possible.

RECOMMENDATIONS

The **RAG supports the recommendations** associated with the orange level as described in the [Winter Plan for respiratory infections](#). Renewed emphasis on these measures, in particular ventilation, mask wearing, and staying home when ill, is urgently needed to improve adherence.

The RAG observes that the **communication** surrounding the upscaling to level orange earlier in January resulted in only **limited behavioural adjustments among the general public**. The RAG recommends to analyse the reasons underlying this muted response, and to adjust where possible.

Experts	Method
Emmanuel André (UZ Leuven), Caroline Boulouffe (AViQ), Simon Couvreur (Sciensano), Laurane De Mot (Sciensano), Géraldine De Muylder (Sciensano), Peter Delputte (UAntwerpen), Pierre-Louis Deudon (CMG), Bertrand Draguez (SPF Santé), Naïma Hammami (Departement Zorg), Niel Hens (UHasselt/UAntwerpen), Vicky Jespers (KCE), Yves Lafort (Sciensano), Christelle Meuris (CHR Verviers), Geert Molenberghs (KULeuven/UHasselt), Reinout Naessens (ZAS), Kathryn Rodière (ONE), Jorgen Stassijns (Sciensano), Giulietta Stefani (Sciensano), Adrae Taame (Vivalis), Gerlant van Berlaer (SPF Santé), Eva Van Braeckel (UZ Gent), Steven Van Gucht (Sciensano), Stefan Teughels (Domus Medica), Koen Vanden Driessche (UZA), Laurens Liesenborghs (ITM), Nathalie Bossuyt (Sciensano), Pieter Libin (VUB), Quentin Mary (SSMG – CMG), Sophie Quoilin (CHU Saint-Pierre)	Online meeting 30/1/2025

APPENDIX: RESPI-RADAR WEEK 4

For background on the indicators included in the Respi-Radar, please refer to the weekly bulletin on Acute Respiratory Infections [\[NL / FR\]](#).
