Disclaimer

1. INTRODUCTION

We are extremely pleased to present you this abstract supplement for the European Public Health Conference 2024 in Lisbon. Like every year, the scientific programme and this accompanying supplement are the fruits of the labours of the International Scientific Committee, who again had to score a higher number of submissions than in previous years. After last successful conferences, it is wonderful to see that also this year so many public health professionals want to share their latest research and engage in discussions with their peers. As for previous conferences, we are confident that the Lisbon conference will prove to be an excellent platform for scientific exchange and debate.

This supplement to the European Journal of Public Health contains the abstracts of presentations at the 17th European Public Health (EPH) Conference, held in Lisbon from 13-15 November and includes abstracts for presentations for the main part of the conference (plenary sessions, oral presentations, workshops and posters).

For the EPH Conference 2024, we received a record 3.364 abstracts of which a record number of 312 workshops. All abstracts were scored by the members of the International Scientific Committee (ISC) of the EPH Conference. The ISC 2024 consisted of 166 public health experts from 33 countries and was chaired by Prof Sónia Dias. To ensure scientific quality without bias, each abstract was scored by on average 4,45 reviewers, each workshop by 4,69. We are extremely grateful to all ISC members for the hard work this involved. The members of the ISC scoring in 2024 are listed below.

The abstracts were scored on a scale of 1 to 7. The average score of the single abstracts was 4,442. The highest score was 6,600 and the lowest 1,250. The average score of workshops was 4,913. The highest score was 6,400 and the lowest 2,400. Only the highest scoring abstracts are accepted for the EPH Conference. We accepted 171 workshops out of 312 and 2.315 single abstracts out of 3.037 submitted. The EPH Conference Executive Board decided on 10 June 2024 on cut-off points for workshops, oral presentations and poster presentations, resulting in an excellent selection of workshops and presentations, as showcased in this abstract supplement.

Workshops	average score of 5,000 or higher were accepted
Oral presentations (8-minute presentation)	average score of 5,667 or higher were accepted
Pitch presentations (5-minute presentation)	average score of 5,275 or higher were accepted
E-Poster walks (3-minute presentation)	average score of 5,100 or higher were accepted
E-Poster displays (throughout the programme)	average score of 4,000 or higher were accepted

Following these decisions, abstracts were grouped in sessions, sessions in tracks and tracks were linked to the contents of the plenary programme. The programme for EPH Conference 2024 is organised in 16 thematic tracks, that mix workshops and oral sessions.

The 16 thematic tracks are:

A. Innovating Public Health: From Research to Action and Policy
B. Revolutionizing Public Health and Healthcare: AI and Digital Health
C. Health Beyond Borders: Global Health Challenges and Sustainable Solutions
D. Equity in Health: Bridging Gaps to Universal Coverage
E. Environmental Health: Innovating Policies and Practices
F. Fostering our habitat: Climate Emergency, Urban Health
G. Easing the Burden: Responding to the Threat of Chronic Diseases
H. Transforming Health Systems: Strength, Resilience, Efficacy
I. Tackling Infectious Diseases: Epidemiology, Vaccines, Preparedness
K. Empower and Educate: The Future of Health Literacy and Promotion
L. Health Policies: Engaging in Public Debates and Decision-Making
M. Mental Health Matters: Advancements in Public Mental Health
N. Caring for Our Next Generation: Equitable Health from Childhood to Adulthood
O. Inclusive Health: Addressing the Needs of Migrants, LGBTI, and Minorities
P. Data-Driven: Assessments for Informed Policy-Making and Foresight
Q. Building Capacity: Learning and Ethics for the Health Workforce

To accommodate the large number of high-quality workshop submissions, we have introduced an innovative format called Pecha Kucha for selected sessions. Pecha Kucha, or 'chat' in Japanese, is a dynamic presentation style where each presentation consists of 15 slides, each shown for 15 seconds. This format allows for concise and engaging 30-minute sessions, fostering lively discussions and rapid exchange of ideas in smaller breakout rooms with a maximum capacity of 35 people. Thanks to all the panelists who agreed to adjust to this format and be part of this new track!

The posters are on display throughout the whole conference.

As always, the International Scientific Committee members greatly enjoyed reading the submissions, many of them stating that it is a great exercise to learn about new developments in their field of expertise. We hope that you will find this volume equally interesting, and even more so the actual presentations, which promise to be of high quality yet again.

Looking forward to welcoming you all in Lisbon,

Dr Ricardo Mexia, Chair of the 17th European Public Health Conference
Prof Sónia Dias, Chair of the International Scientific Committee of the 17th EPH Conference
Charlotte Marchandise, Executive Director EPH Conference

Navigating the AI Wave: Overcoming Barriers and Unleashing the Potential of Artificial Intelligence in Transforming European Public Health

Organised by: WHO Regional Office for Europe, European Observatory on Health Systems and Policies
Moderators: Natasha Azzopardi-Muscat (WHO/Europe), Dimitra Panteli (European Observatory on Health Systems and Policies)
Facilitator: Stefan Buttigieg (EUPHA-DH)

Artificial Intelligence (AI) is not just a future promise but an urgent necessity for modern public health. By providing invaluable insights into disease patterns, therapeutic interventions, and overall public health management, AI has the potential to revolutionise healthcare. To tackle essential public health functions effectively, harnessing AI must become a top priority.

However, there is an urgent need for a cohesive strategy across Europe. Currently, varying readiness levels among European nations regarding AI adoption in health result in uneven progress across the continent. This disparity must be addressed to ensure all countries benefit equally from AI advancements.

Recognising this, the World Health Organization European Regional Office launched a regional report on digital health in 2023. The report evaluated the integration of big data and advanced analytics, including AI, in health systems. Findings revealed that while 60% of Member States have a national data strategy, only 35% have a policy regulating big data and AI in health, and 38% lack both. This highlights a critical gap that must be filled urgently.

Our upcoming session will address these challenges head-on. Organised to provide visionary insights, practical applications, and a landscape view of artificial intelligence in public health, the presentations will be followed by a roundtable discussion in which panellists will delve into practical challenges surrounding AI adoption. They will reflect on the profound impact AI could have on the future of European health systems and offer pragmatic and responsible steps forward, culminating in achievable recommendations for public health professionals.

To enhance the session, we will utilise existing Generative AI tools to provide a real-time summary of the plenary and reinforce the call to action in alignment with panellists' recommendations. This approach ensures that the session discusses the urgent need for AI in public health and actively demonstrates its practical applications.

Moderators:
Natasha Azzopardi Muscat
Director, Division of Country Health Policies and Systems, WHO Regional Office for Europe
Dimitra Panteli
Programme Manager/Senior Health Systems Analyst, European Observatory on Health Systems and Policies

Facilitator:
Stefan Buttigieg
Vice-President, EUPHA Digital health section

Speakers/Panellists:
Martin McKee
Professor of European Public Health, London School of Hygiene & Tropical Medicine, UK
Katharina Ladewig
Director, Centre for Artificial Intelligence in Public Health Research, Robert Koch Institute, Germany
Marco Marsella
Director Digital, EU4Health and Health systems modernisation, Directorate-General for Health and Food Safety (DG SANTE), European Commission
Keyrellous Adib
Technical Officer Data Science and Digital Health, WHO Regional Office for Europe

Global health

Organised by: EUPHA, ASPHER
Moderators: Henrique Barros (ASPHER), Iveta Nagyova (EUPHA)

Global health emphasizes the importance of addressing health challenges that transcend national borders and require strong international collaboration and governance. This concept is grounded in collaborative transnational actions aimed at promoting health for all, reducing disparities, and protecting against threats. Strengthening health systems, public health infrastructure, improving health service delivery, and ensuring equal access to healthcare for all are key focus areas in global health.

This plenary will address several major health challenges and critical issues, such as the rising burden of non-communicable diseases, re-emerging pandemics, environmental threats, and the suboptimal responses of national healthcare systems to manage these challenges. The need to focus on vulnerable and marginalized populations, particularly those affected by migration and ethnicity, will be highlighted. The discussion will also showcase the importance of including ethnic minority and Indigenous people's perspectives in health policy and decision-making processes, as well as addressing the social determinants of health that disproportionately affect these communities.

Central to the discussion on global health is the role of global health policy and diplomacy, focusing on how countries can collaborate to address health threats and challenges, shaping international strategies and frameworks. Innovation, including reverse innovation and the development of evidence-informed policies and effective public health strategies that can be implemented globally and is relevant also in resource-constrained contexts, is another critical aspect in addressing the intersection of health and development. Finally, strong public health leadership is needed to shape practices and policies, as well as fostering the next generation of global health leaders.

The multifaceted nature of global health calls for a comprehensive approach to health—one that integrates policy, leadership, and equity into the core of public health strategies. The integration of health into all policies at the global level is vital for creating supportive environments, policies, services, and communications that promote better health for all.

Moderators:
Iveta Nagyova
President EUPHA
Henrique Barros
President ASPHER

Speakers/Panellists:
Emma Rawson Te Patu
President World Federation of Public Health Associations
Charles Agyemang
Professor of Global Migration, Ethnicity & Health, University of Amsterdam, Netherlands
Agnès Buzyn
Former Minister of Health and Social Affairs, France
Moredreck Chibi
Public Health Innovation Lead, WHO Regional Office for Europe

Tackling Health Inequalities in Times of Crisis
Organised by: EuroHealthNet

Across Europe, people are grappling with a multitude of challenges, spanning from the cost of living to housing, food insecurity, climate change, conflicts, and social unrest. These adversities significantly impact individuals' health and wellbeing, and create the conditions for persisting health inequalities. At the root of these crises are unjust economic systems, in which the privileged few benefit while the majority face difficulties on a daily basis.

Societies across Europe are witnessing rising polarisation and discrimination. Competitiveness and security are emerging as key priorities in the new European political landscape, with health and wellbeing pushed to the sidelines.

Tackling health inequalities in times of crisis requires urgent, targeted action across societal sectors and levels. Education emerges as a crucial equaliser, alongside income and social safety nets. Moreover, effective climate strategies must prioritise the needs of the most vulnerable population groups.

This plenary session lays the groundwork for understanding our contemporary, rapidly evolving landscape and its implications for addressing health inequalities. What lessons can we draw from new approaches across sectors that meet social and health needs, and how can we navigate these challenges – and sail those waves of innovation – to ensure equitable health and social justice for all?

Moderators:
Caroline Costongs
Director EuroHealthNet
Cristina Abreu Santos
Vice-President Instituto Nacional de Saúde Doutor Ricardo Jorge (INSA), Portugal

Keynote speakers:
Fran Baum
The Stretton Institute, The University of Adelaide, Australia (by video message)
Katarina Ivanković Knežević
Director for Social Rights and Inclusion, Directorate-General Employment, Social Affairs and Inclusion, European Commission

Panellists:
Didier Jourdan
UNESCO Chair and WHO Collaborating Centre ‘Global Health and Education’, University of Clermont-Auvergne, France
Jill Litt
Professor of Environmental Health in the Environmental Studies Programme, University of Colorado, USA and Senior researcher, Barcelona Institute of Global Health (ISGlobal), Spain

PLENARY 4

Abstract citation ID: ckae144.004
Harnessing social marketing for interdisciplinary health management: enhancing public health outcomes
Organised by: EHMA

Social marketing in health leverages the principles of traditional marketing to influence behaviours that benefit individuals and communities. It involves using marketing techniques to promote public health initiatives, aiming to change attitudes and behaviours towards healthier choices. By strategically framing health messages, social marketing can effectively reach diverse populations, encouraging them to adopt practices that enhance their wellbeing. This approach not only increases awareness about health issues but also empowers people to take proactive steps in managing their health, ultimately leading to improved public health outcomes.

Showcasing a forward-thinking approach to public health management, this plenary session seeks to shed light on the transformative role of interdisciplinary collaboration in enhancing health outcomes. Recognising that health and wellbeing are influenced by a myriad of actors beyond the healthcare sector, there is a growing imperative to empower professionals from diverse disciplines with health management principles. By effectively 'social marketing' health management to those outside the traditional health sector, such as in architecture, urban planning, construction, education, transportation, and manufacturing, health-oriented decision-making can be seamlessly integrated across these fields.

The session will highlight innovative approaches for engaging non-health stakeholders in decision-making processes, leveraging the expertise of health management and public health professionals. By facilitating a dialogue between health professionals and experts from other sectors, the session will explore the potential and challenges of intersectoral partnerships, and challenge policymakers, health managers, and stakeholders in the health sector to actively engage non-health professionals in their pursuit of improved health outcomes for European citizens.

Case studies from across Europe where interdisciplinary collaborations have led to social programming and infrastructure developments that enhance health and wellbeing will be presented. The case study 'Compassionate leadership' will delve into how organisation leaders can harness their health management capacity to foster a supportive environment that prioritises wellbeing. 'Health-centric design in public spaces' will demonstrate the impact of designing public areas with a focus on health, showcasing how thoughtful urban planning can significantly enhance community health. The third case study, 'Architecture for better health and healing' will highlight the role of architectural design in promoting health and recovery, emphasising the importance of creating spaces that support healing. Finally, 'Educating to health' will underline the significance of educating young people to healthy habits, sustainability, and physical and mental wellbeing, illustrating how this can lead to healthier communities. By fostering broader interdisciplinary collaboration, it is possible to unlock innovative solutions to health challenges and ultimately create healthier, more resilient communities across Europe.

Moderator:
Tiago Correia
Instituto de Higiene e Medicina Tropical, Universidade NOVA de Lisboa, Portugal, and Board Member of the EHMA

Speakers/Panellists:
Marina Macchiaiolo
Rare Diseases and Medical Genetics Unit, Bambino Gesù Children's Hospital, Italy, and President of the Italian Committee for the United World Colleges
Stefano Capolongo
Department of Architecture, Construction Engineering and Built Environment (ABC), Politecnico di Milano, Italy

PLENARY 5

Abstract citation ID: ckae144.005
One Health in Europe: from concept to practice

Organised by: European Commission, ECDC
Moderator: Ricardo Mexia (Chair of the 17th EPH Conference 2024)

The One Health concept is a comprehensive approach that highlights the interconnectedness of human, animal, and environmental health. Understanding these interrelationships is essential for effectively managing and mitigating emerging health threats. This approach emphasizes that health issues arise from a complex web of interactions involving humans, animals, and ecosystems.

Emerging health threats, such as zoonotic diseases (e.g., mpox, Ebola, avian influenza), antibiotic resistance, and environmental degradation, pose significant risks to global health. Zoonotic diseases, which are transmitted between animals and humans, highlight the direct links between animal and human health. The increase in antibiotic resistance, driven by overuse in both human medicine and livestock farming, leads to the rise of resistant pathogens. Environmental issues like climate change, deforestation, and pollution further exacerbate these threats by altering habitats, disrupting ecosystems, and affecting disease vectors.

Addressing these interconnected challenges requires a unified approach that integrates human, animal, and environmental considerations. For example, climate change can shift the distribution of disease vectors like mosquitoes, leading to the spread of diseases such as malaria and dengue fever. Likewise, deforestation can heighten the risk of zoonotic spillover by bringing humans into closer contact with wildlife.

1. To tackle these complex challenges, several measures are crucial:

- Integrated surveillance systems

Developing systems that monitor human, animal, and environmental health data collectively can improve early detection of outbreaks. Sharing information across sectors is a prerequisite for effective identification of emerging threats.

- Strengthening veterinary and public health collaboration

Joint research, surveillance, and outbreak management efforts can lead to a more coordinated approach to health emergencies.

- Promoting One Health education and training

Educating professionals in various fields fosters a collaborative approach to health issues. Training programmes can build a shared understanding of health interconnections.

- Implementing sustainable environmental practices

Adopting sustainable practices to address environmental degradation helps reduce risks associated with habitat destruction and pollution.

- International collaboration and agreements facilitate resource sharing, information exchange, and best practices.

2. To enhance public health strategies within the One Health framework:

- Enhance interdisciplinary research

Promote research on the intersections of human, animal, and environmental health to understand how changes in one area affect others and to develop more effective interventions.

- Foster community engagement

Engage communities to improve the adoption of preventive measures and build resilience against health threats through public awareness and community-based programs.

Leverage technology and innovation

Innovations can offer valuable insights such as data analytics, remote sensing, and genomic surveillance.

In our upcoming plenary session, experts from veterinary and public health sciences will present practical examples on One Health collaboration in Europe and discuss how to address challenges in implementing the approach.

Moderator:
Ricardo Mexia
Chair of the 17th EPH Conference 2024, President EUPHA Infectious diseases control section

Keynote speaker:
Lorena Boix
Deputy Director-General, Directorate General for Health and Food Safety (DG SANTE), European Commission

Speakers/Panellists:
Stef Bronzwaer
Cross-Agency One Health Task Force, European Food Safety Authority (EFSA)
Barbara Häsler
Royal Veterinary College, UK
Susana Guedes Pombo
Chief Veterinary Officer, Portugal, President World Organization for Animal Health (WOAH)
Eva Zažímalová
Member of European Commission's Group of Chief Scientific Advisors, Professor of Plant Anatomy and Physiology, Charles University, Czech Republic

1.A. Oral presentations: Public health innovations: insights and impact

Abstract citation ID: ckae144.006

Innovations in abortion care in France, Germany and the UK following the COVID-19 pandemic

Céline Miani

C Miani[1], *J Niemann*[2]
[1]School of Public Health, Bielefeld University, Bielefeld, Germany
[2]Institute for Medical Sociology, University Medicine Halle, Halle, Germany
Contact: celine.miani@uni-bielefeld.de

Background: Through an international comparison of health systems and policies, we aim at assessing the contextual and circumstantial characteristics of abortion care innovation in three European countries following the upheaval of the COVID-19 pandemic. The three contrasting care models pre-pandemic constitute an interesting baseline for observing different systems' reaction to health crises.

Methods: We conducted a review of the recent (2020 onward) peer-reviewed and grey literature, including national policy documents and guidelines. We then carried a comparative analysis of innovations implemented during the pandemic and their sustainability post-crisis.

Results: In France and the UK, where abortion care was more accessible before the pandemic than in Germany, a series of innovations were officially introduced to facilitate access during the pandemic. They included teleconsultations and the mailing of abortion medication. Most changes have been sustained since then, contributing to addressing historic and systemic health inequities in terms of access (e.g. due to geography and the existence of "medical deserts"). In Germany, innovations during the pandemic have been crafted by the civil society through NGOs offering for the first time teleabortion services (e.g. Balance Berlin and Doctors for Choice). The legitimation of those practices by professional bodies is still in the making, highlighting the limitations of the catalyst role of crises in the face of cultural barriers and resistance of health systems to innovation.

Conclusions: The COVID-19 pandemic provoked or accelerated innovation in terms of abortion care in France, Germany and the UK. Yet, its sustainability, as well as its scaling up, remains fragile, especially in Germany, where the disruptive approach of civil society organisations has not yet found its way into mainstream health care services.

Key messages:

- International comparison of health systems' reaction to the COVID-19 pandemic in terms of abortion care shows different paths to innovation.
- The sustainability of innovation beyond the first pandemic years pertains to the wider debate on equity in access to abortion care.

Abstract citation ID: ckae144.007

Inequalities in healthy life expectancy and risk factors for poor health in small geographic areas

Nicholas Steel

N Steel[1], *M Saunders*[1], *M Bachmann*[1], *Z Shabuz*[1], *A Dalton*[1], *O Enwo*[1], *J Brainard*[1], *C Jones*[1], *A Burke*[1]
[1]University of East Anglia, Norwich Medical School, Norwich, UK
Contact: n.steel@uea.ac.uk

Background: Reducing inequality in healthy life expectancy (HLE) is a UK government ambition and requires more detailed knowledge of interrelated morbidity and mortality risks at smaller areas than is routinely available. We assessed HLE and risk factors in small areas.

Methods: We used publicly available data to estimate HLE in 2011 and 2021 at birth and age 65 for males and females for 128 Middle layer Super Output Areas (MSOA) in Norfolk and Waveney, described the distribution using geospatial mapping, and analysed associations with risk factors using linear regression.

Results: Mean HLE at birth was 66.5 years (standard deviation 4.3; range 52.0 to 73.0) for men and 67.5 (3.9; 56.0 to 74.0) for women, and at age 65 was 10.9 years (1.8; 6.0 to 16.0) and 12.2 (1.9; 5.0 to 15.0) respectively in 2021. The range in HLE increased between 2011 and 2021 by 2.8 years for men and 1.6 years for women. HLE was usually lower and risks higher in urban and coastal areas. Lower HLE at area level was associated with lower weekly income, physical inactivity, air pollution, alcohol admissions, living alone as an older person and diet not meeting '5 a Day'. HLE at age 65 in 2021 increased by: 0.2 (95% CI 0.1,0.2) years for men and 0.2 (0.2,0.3) for women for each £10 rise in weekly net income after housing expenditure; 0.1 (0.1,0.2) years for men for each 10 fewer alcohol attributable hospital admissions per 100,000 admissions; 0.66 (0.31,1.00) years for men and 0.53 (0.15,0.91) years for women per 1 μg/m3 less 2.5 mm particulate matter concentration in air pollution; 0.6 (0.2,1.0) years for men and 0.6 (0.1,1.0) years for women for each 10% fewer people being physically inactive (multiple regression).

Conclusions: This innovative approach can be used to monitor risks and inform targeted public health interventions at a local level more relevant to local policy makers. Stronger public health surveillance systems are needed to accurately monitor a wider variety of local data on risks.

Key messages:

- Healthy life expectancy at age 65 varies by over 10 years for men and women between different small geographic areas in an English county, alongside local variation in risk factors for poor health.
- Lower HLE at area level was associated with lower weekly income, physical inactivity, air pollution, alcohol admissions, living alone as an older person and diet not meeting '5 a Day'.

Abstract citation ID: ckae144.008

NCD prevention and control in Kenya: feasibility study of health kiosks in markets "HEKIMA Study"

Marjorie Lima do Vale

S Harding[2], *I Kaduka*[1], *J Olale*[1], *J Mutai*[1], *S Mbuka*[1], *M Bosire*[1], *M Obuya*[1], *D Mitaru*[1], *R Ochieng*[1]
[1]King's College London, London, UK
[2]Kenya Medical Research Institute, Nairobi, Kenya
Contact: marjorie.lima_do_vale@kcl.ac.uk

Introduction: Non-communicable diseases (NCDs) account for 50% of hospital admissions and 55% of hospital mortality in Kenya. Cardiovascular diseases (CVDs) lead NCD mortality at 14% due to high prevalence of multiple risk factors. Community markets are social institutions with untapped potential for public health. HEKIMA is a multi-phased theoretically driven intervention exploring whether health kiosks in community markets, manned by community health workers (CHWs) and supervised by health centre (HC) nurses, can improve the reach of preventive care to vulnerable communities.

Methods: A mixed methods study in Vihiga County targeting 320 participants aged 15 years and above. Nurses and CHWs were trained to deliver evidence-based CVD health promotion, risk screening, and early intervention. Multi-sector stakeholder consultations, readiness assessments of markets and HCs, and semi-structured interviews informed intervention development. Evaluation use the Re-AIM framework.

Results: At 6 months of intervention there 2224 kiosk users which exceeded target of 300; 61% primary school education; 77% females; median age - males 48y, females 52y. Proportion with high blood pressure, overweight, obesity, and diabetes 48%, 32%, 25% and 12% respectively. 30% were referred to HC, and 34% followed up at least once at the kiosk. High acceptability of HEKIMA among CHWs, nurses and market users led to HEKIMA kiosks being integrated in the primary healthcare pathway. Key enablers were multi-sectoral alliance of government, civic organisations, community market champions, local businesses and health sector; culture centred coproduction and capacity building Challenges included understaffing, commodity supplies and seasonality.

Conclusions: HEKIMA successfully promoted NCD prevention and control, particularly among vulnerable populations. Scaling up across Kenya is planned to explore translational impacts in different contexts.

Key messages:

- Multisectoral alliance critical for prevention of NCDs.
- Theoretically underpinned complex systems interventions addresse inequities.

Abstract citation ID: ckae144.009
Bridging the gap: mapping co-creation methods for public health impact and innovation

Danielle Agnello

Background: Co-creation offers a promising approach to public health innovation, particularly for tackling complex issues. However, the lack of a standardized methodology limits its reliability and reproducibility, especially across diverse contexts. This study explores co-creation methods used by researchers and practitioners, aiming to shed light on their implications for public health. Understanding this methodological landscape can enhance the effective implementation of co-creation processes to address complex challenges.

Methods: Utilizing the Systematic Methods Overview approach, we examined co-creation methods. Data were gathered from the Health CASCADE Co-Creation Database and grey literature using an artificial intelligence-assisted recursive search strategy and a two-step screening process. We conducted textual, comparative, and bibliometric analyses to evaluate methodological underpinnings and relationships between methods.

Results: Analysis of 2,627 academic articles and grey literature sources identified over 900 co-creation methods. While surveys, focus groups, and group discussions were prevalent, participatory methods were underutilized. Notably, 91.3% of methods co-occurred, with a predominant combination of qualitative approaches. Furthermore, a significant discrepancy between research and practice was evident, with only 10.2% convergence.

Conclusions: This study revealed a critical gap between co-creation in research and practice, emphasizing the need to bridge this methodological divide for advancing co-creation as a reliable approach in public health. The over-reliance on qualitative methods raises concerns about tokenistic engagement and undermines meaningful public participation in co-creation. Addressing this trend is vital to preserve the essence of true co-creation and maximize its potential for addressing complex public health challenges.

Key messages:

- Mapping the diverse methods of co-creation in public health reveals both richness and disparities in approach, from surveys to participatory methods.
- Addressing the discrepancy between co-creation in research and practice is vital for establishing a reliable and effective approach to tackling public health challenges.

[3]Belgian Health Care Knowledge Centre, Brussels, Belgium
Contact: rani.claerman@sciensano.be

The NEED (Needs Examination, Evaluation and Dissemination) assessment framework was developed to identify and measure health-related patient and societal unmet needs across different health conditions, supporting the creation of needs-driven healthcare policy and innovation. It includes 25 criteria of needs and 46 related indicators allowing to estimate if the needs are met. The current study aims to validate this framework on the EU level using a modified Delphi approach. The selection of national and European institutes invited to participate in the Delphi process was based on their respective roles; specifically, public health, health technology assessment (HTA), medicine authorisation, pricing and reimbursement (P&R), and patient advocacy. Through a modified Delphi approach, the experts were able to express their opinion on the framework structure (dimensions and domains), health-related needs criteria and indicators. Two Delphi rounds were performed using online questionnaires. Consensus was reached when 85% of the respondents agree or totally agree with a proposal and less than 5% of the respondents totally disagree. A panel of 27 experts participated in the first round of the study. The majority of the experts worked in HTA agencies (39%) and P&R agencies (24%), followed by national medicine authorities (9%) and umbrella patient organisations (9%). Seventeen EU Member States were represented, with a higher representation of experts from Austria, Belgium, France, Germany, The Netherlands, Spain and Sweden. Consensus was reached for 22 out of the 25 criteria and 41 out of the 46 indicators after the first round. The modified Delphi technique was an adequate approach to aid the validation of the NEED framework at the EU level. This represents an important first step in achieving consensus on how to define and identify unmet health-related needs and move towards a more needs-driven healthcare policy and innovation landscape.

Key messages:

- Consensus on the definition and identification of unmet health-related needs is crucial to transform public health innovation.
- Expert consultation by means of the Delphi technique assumed a pivotal role to reach consensus on the NEED framework.

1.B. Round table: Artificial Intelligence in Mobile Health Apps: Ethical, Legal, and Regulatory Challenges

Abstract citation ID: ckae144.011

Organised by: Law Centre for Health and Life (Netherlands)
Chair persons: Hannah van Kolfschooten (Netherlands)
Contact: h.b.vankolfschooten@uva.nl

Globally, governments and public health authorities are integrating Artificial Intelligence (AI) techniques in mobile apps to improve public health. For example, during the COVID-19 outbreak, AI-driven chatbots were deployed to provide immediate health information and advice. AI-based mobile apps are also used to support mental health or for preventive healthcare, such as personalized dietary recommendations. Moreover, the use of generative AI for public health purposes is rapidly increasing. In 2024, the WHO launched S.A.R.A.H - a generative AI chatbot designed to provide information on major health topics such as healthy lifestyles and mental health. By integrating AI, public institutions could potentially achieve better health outcomes, improve efficiency, and enhance access to healthcare. However, the rapid adoption of AI public health apps also raises significant ethical, legal, and regulatory challenges. The large amounts of sensitive personal data collected and processed by such apps may create issues for privacy, data protection, and cybersecurity. At the same time, the tendency of AI to exhibit biases may deepen existing health inequities. The new EU 'digital' legal framework does not directly address these challenges. This workshop aims to convene leading experts working on AI in health to address these issues. We bring together scholars from different disciplines (health law, health policy, bioethics, biosciences). The workshop objectives are twofold: (1) to critically assess the current landscape of AI in public health apps from a legal, ethical, and regulatory point of view, and (2) to lay the groundwork for policy recommendations on how to ensure the deployment of AI apps for public health in compliance with ethical principles and fundamental rights. First, the panel explores the differences in the data protection regulation of AI public health apps in the EU and the US (speaker: James Hazel). Second, it discusses how these apps are regulated under the new EU Artificial Intelligence Act (speaker: Hannah van Kolfschooten). Third, it investigates the consequences of the European Health Data Space regulation on how health data can be processed through public health apps (speaker: Mahsa Shabani). Finally, as the cross-border use of apps complicates regulatory efforts, it discusses the need for international cooperation in establishing and enforcing guidelines (speaker: Vasiliki Rahimzadeh). The workshop will be conducted as a round table discussion with 4 short presentations of 5 minutes each. Speakers first present a key challenge posed by AI in mobile health apps, and then suggest a potential regulatory solution. This will be followed by a dialogue between panelists and the audience to share best practices on how to regulate AI in mobile public health apps from a legal, ethical, and regulatory perspective. The input will be used to develop a submission for the Call for papers of BMC Bioinformatics.

Key messages:

- As public institutions are increasingly integrating AI technologies into their mobile public health solutions, it is crucial to evaluate the ethical, legal, and regulatory implications.
- In light of current gaps in the EU legal framework, we convene scholars from different disciplines and legal systems to design guidelines on the ethical use of AI mobile apps for public health.

Speakers/Panelists:

1.C. Round table: Navigating the 17th European Public Health Conference: A Guide for First-Time Attendees

Abstract citation ID: ckae144.012

Organised by: EUPHAnxt, EUPHA
Chair persons: Monica Brînzac (EUPHAnxt)
Contact: monica.brinzac@publichealth.ro

Are you attending the European Public Health Conference for the first time? If yes, this session is for you. Join us for an engaging session tailored specifically for first-time attendees of the 17th European Public Health Conference in Lisbon, Portugal. This session aims to provide newcomers with valuable insights and strategies to maximize their experience and effectively navigate the conference.

Our seasoned conference veterans will share practical tips on a range of topics, including, but not being limited to:

1. Conference Navigation: Learn how to navigate the conference programme, the venue efficiently, locate sessions of interest, and make the most of your time between sessions.
2. Networking: Discover the importance of networking in the field of public health and gain strategies for initiating meaningful conversations, building professional relationships, and expanding your professional network.
3. Session Selection: Gain insights into selecting sessions and workshops that align with your interests, career goals, and areas of expertise. Learn how to prioritize your schedule and make the most of concurrent sessions.
4. Poster Presentations: Understand the significance of poster presentations and how to effectively engage with presenters. Discover techniques for synthesizing information and asking insightful questions.
5. Self-Care: Explore strategies for maintaining physical and mental well-being throughout the conference, including tips for managing fatigue, staying hydrated, and finding moments of relaxation amidst the hustle and bustle.

Whether you're a student, researcher, practitioner, or policymaker, this session will equip you with the tools and knowledge needed to navigate the 17th European Public Health Conference with confidence and make the most of this invaluable opportunity for professional development and networking.

Key messages:

- First-time attendee at the European Public Health Conference? Don't miss this tailored session for essential insights and strategies to maximize your experience in Lisbon.
- Join seasoned veterans for practical tips on navigating the conference, networking effectively, selecting sessions, engaging with poster presentations, and prioritizing self-care.

Speakers/Panelists:
Robert Klarecki
EPH Conference Office
Jinane Ghattas
Sciensano, Brussels, Belgium

1.D. Scientific session: Cross national perspectives: the many faces of health inequities

Abstract citation ID: ckae144.013

Organised by: The Commonwealth Fund (USA)
Chair persons: Evan Gumas (USA), Reginald Williams (USA)
Contact: eg@cmwf.org

Health inequities come in different forms in different countries, often times based on country and population demographics, and exist around the world. Ample evidence has revealed how inequities to accessing and utilizing health services can have detrimental consequences for certain populations and exist across numerous strata including geography, income, race and ethnicity, age, and gender. This workshop identifies different examples of inequities across countries, and their impact on health outcomes and health care use. Health inequities, in whichever form, lead to one common outcome: worse health outcomes and lower life expectancy for those who are marginalized by inequities compared to their counterparts. This session will dive into the research on health inequities by geography (rural versus non rural), income (low/average income versus high income), race/ethnicity, and among people with substance use disorder (SUD) particularly those who use and inject drugs with the goal of 1) exposing the stark disparities in health care among these populations; 2) discussing lessons which can be learned and adapted from other countries; and 3) discussing promising solutions and approaches to restoring justice and access to care for all. The panel will be composed of 1 moderator and up to 5 panelists. Panelists are experts in their fields, established researchers and practitioners, and either employees of the Commonwealth Fund or alumni of the Harkness Fellowship from various high-income countries including Canada, Germany, Norway, the United Kingdom, and the United States. A moderator from the Commonwealth Fund will frame the discussion by introducing a deep dive into affordability barriers utilizing the Commonwealth's Fund International Health Policy Survey of nine countries. Munira Gunja, senior researcher on the Commonwealth Fund's International program, will present how a lack of affordability in health care is a growing threat and will likely widen the disparities by income without serious health reforms. Neil MacKinnon, Senior Harkness Fellow from Canada, will continue the discussion focusing on an analysis he and his team at Augusta University completed on disparities in health care by geography in eleven (primarily European) countries. The second panelist, Sidra Khan-Gokkaya, the 2023-2024 Harkness Fellow from Germany, will present on her study of racism in health care in Germany and the U. S. Another of the 2023-2024 Harkness Fellows, Claire Wilson, will present on her research of racial disparities in perinatal mental illness in the U.K. and U.S. Lastly, the fifth panelist, Ane Kristine Finbråten will discuss the unique health needs of those with SUD and the inequities faced by people who use and inject drugs as they navigate health care. Each panelist will speak for roughly 8 minutes, with 20 minutes saved for moderator and audience questions.

Key messages:

- All stakeholders, including patients, public health systems, and health systems benefit when all populations are able to access comprehensive health services.
- Health inequities come in many different forms, and to improve health outcomes, we must address them at all levels.

Abstract citation ID: ckae144.014
The cost of not getting care: income disparities in the affordability of health services across high-income countries

Munira Gunja

M Gunja[1], E Gumas[1], R Williams[1], M Doty[1], A Shah[1], K Fields[1]
[1]International Health Policy and Practices, The Commonwealth Fund, New York, USA
Contact: mg@cmwf.org

This presentation will present findings from the Commonwealth Fund 2023 International Health Policy Survey of the General Population, focusing on financial barriers in accessing healthcare among adults across 10 countries. It highlights significant income-related disparities in healthcare affordability, particularly in the United States, where nearly a quarter of the population lacks affordable access to care. While disparities exist in other countries, Germany and the Netherlands demonstrate lower rates of affordability issues and income disparities, possibly due to their universal health coverage models and cost-sharing caps based on income levels. These countries also prioritize mental health and dental care within their public health plans. The analysis emphasizes the critical need for affordable and comprehensive healthcare coverage to ensure equitable health outcomes. It suggests that policies such as cost-sharing caps and income-based subsidies could mitigate financial barriers to care, drawing insights from successful models in Germany and the Netherlands. Ultimately, addressing affordability is vital for achieving health equity and improving overall population health.

Health care delivery faces a myriad of challenges globally with well-documented health inequities based on geographic location. Yet, researchers and policy makers have a limited understanding of the frequency of geographic health disparities. In this survey study, we analyzed results from the 2020 Commonwealth Fund International Health Policy (IHP) Survey-a nationally representative, self-reported, and cross-sectional survey of adults from Australia, Canada, France, Germany, the Netherlands, New Zealand, Norway, Sweden, Switzerland, the UK, and the US. Eligible adults older than age 18 years were included by random sampling. Survey data were compared for the association of area type (rural or urban) with 10 health indicators across 3 domains: health status and socioeconomic risk factors, affordability of care, and access to care. Across the 11 countries and 10 health indicators and 3 domains (health status and socioeconomic risk factors, affordability of care, access to care), there were 21 occurrences of geographic health disparities. The indicators with the most occurrences of geographic health disparities were in the access to care domain. Differences in number of disparities reported by country suggest that health policy and decision makers in the US should look to Canada, Norway, and the Netherlands to improve geographic-based health equity.

Abstract citation ID: ckae144.016
Racism in health care: systemic changes and institutional policies to advance health equity

Sidra Khan-Gökkaya

S Khan-Gökkaya[1,2]
[1]Integration and Antiracism Office, University Medical Center Hamburg–Eppendorf, Hamburg, Germany
[2]Harkness Fellowship, The Commonwealth Fund, New York, USA
Contact: skhangokkaya@hsph.harvard.edu

Globally, the COVID-19 pandemic has amplified inequalities in health care. Racism is one cause of such inequalities that disadvantage Black, Indigenous, and people of color around the world, but particularly in Germany, European countries, and the United States. To advance health equity and ensure an equitable health care system for marginalized groups, it is necessary to implement systemic change, but international studies indicate there is little evidence of antiracist interventions in organizations and through policies, as well as limited data on their effectiveness. This presentation will present novel research that identifies antiracist interventions on a systemic level, meaning interventions within organizations will be analyzed. The results from this research will be used to derive recommendations and inspire policymakers and providers toward equity-oriented health care. The overarching goal of the proposed research is to contribute to a paradigm shift in Germany and Europe more broadly and enrich a previously deficit-oriented perspective on the topic with important approaches and solutions. It will also increase the geopolitical relevance of the interventions in the US and enable cross-border exchange and partnerships.

Abstract citation ID: ckae144.017
Exploring racial inequalities in maternal mental health outcomes

Claire Wilson

C Wilson[1,2,3]
[1]Institute of Psychiatry, Psychology & Neuroscience, London, UK
[2]South London and Maudsley NHS Foundation Trust, London, UK
[3]Harkness Fellowship, The Commonwealth Fund, New York, USA
Contact: claire.1.wilson@kcl.ac.uk

Perinatal mental illness affects around 1 in 5 birthing people globally and is associated with adverse outcomes for those affected and their families. Such adverse outcomes are not inevitable and there is now good evidence for a range of both preventive and treatment interventions. There are well-documented inequalities in mental health outcomes across a range of social determinants, including race; such inequalities are also apparent during the perinatal period. There are also racial disparities in mental health care delivery during the perinatal period. Racial inequalities in perinatal mental health are now being recognized as key policy priorities in both the United States and the United Kingdom. This presentation will present routinely collected epidemiological data, investigating the drivers of these racial inequalities in access to perinatal mental health services and associated maternal and child outcomes. It also will present qualitative approaches to exploring current initiatives to reduce inequalities. Findings have the potential to inform the development of culturally sensitive interventions to promote equity in this area for underserved populations in the U.K., U.S., and elsewhere.

Abstract citation ID: ckae144.018
Inequities faced by those with substance use disorder (SUD)

Ane-Kristine Finbråten

A Finbråten[1,2]
[1]Lovisenberg Diakonale Sykehus, Oslo, Norway
[2]Harkness Fellowship, The Commonwealth Fund, New York, USA
Contact: ane.finbraten@gmail.com

This presentation delves into the inequities faced by individuals with substance use disorder (SUD), with a particular focus on people who use drugs (PWUD) and people who inject drugs (PWID). Individuals contending with SUD encounter multifaceted barriers that hinder access to appropriate care and support. This presentation will highlight the discourse surrounding biases that exacerbate health disparities among PWUD and PWID. Structural stigma and discriminatory practices not only impede access to healthcare services but also perpetuate social exclusion, amplifying the challenges faced in seeking help and support. PWUD and PWID often require tailored interventions that address not only their substance use but also co-occurring physical and mental health conditions. However, the fragmented nature of healthcare delivery and the lack of integration between substance use treatment and mainstream healthcare services pose significant obstacles to holistic care provision. Drawing on empirical evidence and lived experiences, this presentation explores strategies to dismantle the barriers faced by individuals with SUD in Norway. Ultimately, this presentation aims to foster dialogue that addresses the inequities entrenched in healthcare systems around the world. By advocating for a compassionate and inclusive approach to SUD care, we can strive towards a society where all individuals, regardless of their substance use history, can access the support and resources they need to lead healthy and fulfilling lives.

1.E. Oral presentations: Understanding the health implications of environmental challenges

Abstract citation ID: ckae144.019
Burden of disease due to ambient particulate matter pollution in Germany from 2010 to 2021

Dietrich Plass

D Plass[1], S Kienzler[1], D Wintermeyer[1]
[1]Exposure Assessment and Environmental Health, German Environment Agency, Berlin, Germany
Contact: dietrich.plass@uba.de

Background: Worldwide, according to the global burden of disease (GBD) study, around 118 million disability-adjusted life years (DALYs) were attributable to ambient particulate matter (PM2.5) in 2019. Further, 97% of Europe's urban population are exposed to annual average levels of PM2.5 above the World Health Organization's guideline value of 5 $\mu g/m^3$. In Germany, considerable efforts have been made to reduce PM2.5-emissions, which resulted in a continuous decrease of exposure. We estimated the burden of disease attributable to PM2.5-exposure in Germany for a time series from 2010 to 2021.

Methods: We used the environmental burden of disease (EBD) methodology developed by the WHO. For the exposure assessment we combined annual average measured and modelled PM2.5-concentrations with information on population density at a 2-by-2 km^2 grid. Using the exposure-response functions from GBD 2019, we estimated the EBD for chronic obstructive pulmonary diseases, type 2 diabetes mellitus, lung cancer, stroke and ischemic heart diseases (IHD). National surveys and register data were used to estimate the baseline burden of disease.

Results: In total, we estimated 232,863 (95%-CI: 153,716-314,882) DALYs attributable to PM2.5 in 2021. We observed a reduction of about 50% compared to 2010. The highest attributable burden was estimated for IHD with 70,197 (95%-CI: 42,609-101,785) DALYs, which is about 8% of the overall IHD-burden. The mortality-to-morbidity ratio revealed that years lost due to death (YLLs) had a higher share (69.9%) of overall DALYs with 162,561 (95%-CI: 106,918-222,567) YLLs.

Discussion: Despite a decreasing trend of the EBD for PM2.5 in Germany since 2010, our results show that there is still a long way to a pollutant free environment as envisaged by the EU's zero pollution ambition. Using EBD as a standardized methodology and the DALYs as the core measure allows to have a comprehensive and comparable overview of the impact of PM2.5 on population health.

Key messages:
- Ambient particulate matter pollution is an important environmental risk factor in Germany.
- The decreasing trends is encouraging but there is still a long way to go to meet the objectives of the EU's zero pollution ambition.

Abstract citation ID: ckae144.020
How ambient NO2 impacts the mortality burden of ischemic heart disease in Portugal (2011-2021)?

Marta Clemente

M Clemente[1], M Corda[2], C Martins[1,3]
[1]NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
[2]CiiEM, Egas Moniz School of Health & Science, Caparica, Portugal
[3]Comprehensive Health Research Center, NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
Contact: mjs.clemente@ensp.unl.pt

Background: Air pollution is a major environmental risk to human health, contributing to premature death and disease. Nitrogen dioxide (NO2) is a pollutant of significant public health concern, associated with increased risks of all-cause mortality, particularly in cardiovascular and respiratory deaths. In 2021, NO2 exposure exceeding the World Health Organization Air Quality Guidelines resulted in 69,000 deaths in the European Union. This study aims to estimate the impact of ambient NO2 exposure on ischemic heart disease (IHD) in Portugal, from 2011 to 2021, estimated in years of life lost (YLL).

Methods: Data on ambient NO2 levels were obtained from the Portuguese Environment Agency's online database QualAr. Only monitoring stations that reported valid data for at least 75% of the time in a year were considered. The number of IHD mortality cases from 2011 to 2021 was sourced from Statistics Portugal. The burden of IHD attributed to NO2 exposure was estimated in YLL for the Portuguese population aged 25 years and older, categorized by five-years age groups, regions of mainland Portugal and sex, using the population attributable fraction (PAF).

Results: Between 2011 and 2021, mainland Portugal experienced a declining trend in NO2 mean levels, with occasional fluctuations. Regarding IHD YLL attributed to NO2 exposure, the same trend was followed with an overall decline over the study period. In total, 94,843.75 (95% CI 53,408.35-134,766.17) IHD YLL were attributed to NO2 exposure, with an estimated number of IHD YLLs higher for males than for females.

Conclusions: These findings underscore the significant impact of air pollution on human health. Despite an overall reduction in YLL across mainland Portugal, persistent health effects emphasize the need to reduce NO2 concentrations, with informed decision-making being crucial to mitigate these impacts and protect public health.

Key messages:
- Ambient NO2 exposure significantly impacts ischemic heart disease mortality in Portugal.
- These estimates underscore the necessity of well-informed decision-making to safeguard public health.

Abstract citation ID: ckae144.021
Health burden and costs attributed to the carbon footprint of health systems in the European Union

Jose Chen-Xu

J Chen-Xu[1,2], MO Corda[1,3], O Varga[4,5], S Viegas[1]
[1]Comprehensive Health Research Centre, NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
[2]Public Health Unit, Local Health Unit of Baixo Mondego, Figueira da Foz, Portugal
[3]Center for Interdisciplinary Research, Egas Moniz School of Health & Science, Caparica, Almada, Portugal
[4]Syreon Research Institute, Budapest, Hungary
[5]Department of Public Health and Epidemiology, Faculty of Medicine, University of Debrecen, Debrecen, Hungary
Contact: josechenx@gmail.com

Background: Health systems have an environmental impact of around 4.6% of global emissions, contributing to aggravating the climate crisis. However, the health impact of the carbon emissions originated by health systems is not regularly assessed. We aim to estimate the health burden and associated costs of the carbon footprint of health systems across the European Union (EU).

Methods: We calculated DALYs and associated costs based on human health damage factors (DALYs/kg-CO2e) by considering four scenarios. Three scenarios for shared socioeconomic pathways

(S1 - high growth, S2 - baseline, and S3 - low growth) represented variations of global society, demographics, and economics until 2100. A fourth scenario (S4) considered the current EU's 55% reduction goal of greenhouse gas emissions. The healthcare sector's emissions per capita (in CO2-equivalent) in 2019 were extracted from the Lancet Countdown, and population data were retrieved from Eurostat for the same year.

Results: In the EU, 365,047 DALYs (95%CI: 194,692-535,403) are expected to be caused by health systems' emissions at baseline (S2). In an S1 scenario, the burden would slightly decrease to 315,374 DALYs (95%CI: 170,355-462,393), whereas a S3 scenario would increase 486,730 DALYs (95%CI: 243,365-681,422). If EU's carbon goals are met, the burden could be substantially reduced to 164,271 DALYs (95%CI: 87,611-240,931). The monetisation of DALYs can result in costs amounting to 25.6 billion euros.

Conclusions: CO2 emissions from health systems are expected to significantly impact human health. It is therefore of the utmost importance to ensure that EU climate policies for healthcare buildings are in line with the Paris Agreement. This will require the implementation of climate mitigation programmes within the health sector and a review of clinical practices at the local level.

Key messages:

- The carbon footprint of health systems is estimated to significantly impact health, with high economic burden.
- EU climate policies for healthcare buildings and procurement must be aligned with the Paris Agreement.

Abstract citation ID: ckae144.022
Better together: a program to increase the public health corps in the southeast United States

Sarah Kershner

S Kershner[1], *T George*[1], *J Hucks*[1]
[1]Health Sciences, Francis Marion University, Florence, USA
Contact: SKershner@fmarion.edu

Background: This undergraduate public health program implemented in the southeastern United States addresses the need for an expanded public health corps to fill health service gaps underscored by the Covid-19 pandemic, including a shortage of personnel with the skill to function on emergency frontlines; workforce development resources; and socially just healthcare programs to support under-resourced areas.

Objectives: To enhance student knowledge of public health and increase volunteers available for emergency and public health response within local, state, and global communities. After program participation, how confident did participants feel that they could know what to do in the case of an emergency? After program participation, how knowledgeable did participants feel that they would know what to do to protect others in the case of an emergency? After program participation, how aware were participants about the issue of public health response and preparedness?

Results: 216 students were recruited at a university in the southeastern United States, and 75% completed 30 hours of modules, immersion activities and skill-based trainings. Almost all (91%) were pre-nursing/nursing or public health majors. The majority of participants (90%) indicated a level of agreement with the statement, "I am confident that I know what to do in the case of an emergency" and 93% indicated a level of agreement with the statement, "I would know what to do to protect others in the case of an emergency". Almost all participants (96%) indicated a level of agreement with the statement, "My awareness of public health response and preparedness has increased due to participation in the project". Qualitative results mirrored a similar strong level of support for the program.

Conclusions: Students who complete appropriate training play an essential role in pandemic management and the broad training the medical workforce receives can also be applied to diverse disaster scenarios.

Key messages:

- The goal of the project was to enhance undergraduate student knowledge of public health.
- The secondary goal of the project was to increase the number of students available to volunteer for emergency and public health response in local, state, and global communities.

Abstract citation ID: ckae144.023
How was the impact of heatwaves on daily hospital admissions in Portugal (2000-2018)?

[7]CIDNUR, Escola Superior de Enfermagem de Lisboa, Lisbon, Portugal
Contact: margarida.alho@arslvt.min-saude.pt

Background: Climate change has increased the frequency, intensity, and duration of heatwaves, posing a serious threat to public health. While the link between high temperatures and premature mortality has been extensively studied, the comprehensive quantification of heatwave impacts on morbidity remains understudied.

Methods: We assessed the relationship between heatwaves and daily hospital admissions at a county level in Portugal, considering all major diagnostic categories and age groups, over a 19-year period from 2000 to 2018. Our nationwide study included a comprehensive geospatial analysis, integrating over 12 million hospital admission records with heatwave events indexed by the Excess Heat Factor (EHF), covering all 278 mainland counties. To estimate the impact of heatwaves on hospital admissions, we applied negative binomial regression models at both national and county levels.

Results: A statistically significant overall 18·9% increase in daily hospital admissions was found during heatwave days (IRR=1·189, 95% CI: 1·179-1·198). This impact affected all age groups, with pediatric ages being the most affected (21·7%), followed by the working-age (19·7%) and elderly individuals (17·2%). All 25 Major Disease Diagnostic Categories experienced significant increases, particularly Burns (34·3%), Multiple Significant Trauma (26·8%), and Infectious and Parasitic Diseases (25·4%). Notable rises were also observed in Endocrine, Nutritional, and Metabolic (25·1%), Mental (23%), Respiratory (22·4%), and Circulatory (15·8%) diseases.

Conclusions: Our results provide statistically significant evidence of the association between heatwaves and increased hospitalizations across all age groups and for all major causes of disease. This is the first study to estimate the full extent of heatwaves' impact on hospitalizations using the EHF index over a comprehensive 19-year period, encompassing an entire country, and spanning 25 disease categories during multiple heatwave events.

Key messages:

- There is a clear association between heatwaves and increased hospital admissions across all age groups and Major Diagnostic Categories.
- Our data offer crucial information to guide policymakers in effectively and efficiently allocating resources to address the profound healthcare consequences resulting from climate change.

1.F. Pitch presentations: The impact of climate change on health

Association between gender inequality and climate adaptation across the global

Ana-Catarina Pinho-Gomes

AC Pinho-Gomes[1,2], *M Woodward*[1]
[1]The George Institute for Global Health, London, UK
[2]Institute for Global Health, UCL, London, UK
Contact: a.pinho-gomes@ucl.ac.uk

Introduction: Climate change has a disproportionate impact on women in comparison to men and women have a key role to play in climate adaptation. However, evidence is lacking on how gender inequalities may be associated with climate vulnerability and ability to respond at country level.

Methods: This ecological study investigated the association between climate adaptation, measured by the Notre Dame Global Adaptation Initiative Country Index (ND-GAIN), and gender inequality, measured by the Global Gender Gap Index (GGGI) developed by the World Economic Forum and the Gender Inequality Index (GII) developed by the United Nations. Simple linear regression was used to estimate the associations between the indices and their subdomains for 146 countries.

Results: There was an approximately linear association between the GGGI and climate adaptation. Each 1% increase in gender equality was associated with a 0.6% increase in the ND-GAIN score (slope 0.59, 95% confidence interval [0.33 to 0.84]). This was driven by a negative association between gender equality and vulnerability (-0.41 [-0.62 to -0.20]), and a positive association between gender equality and readiness (0.77 [0.44 to 1.10]). Gender equality in the education domain of the GGGI had the strongest association with climate adaptation. There was a strong negative linear association between the GII and climate adaptation, which explained most (87%) of the between-country variation in climate adaptation. Each 1% increase in gender inequality was associated with a 0.5% decrease in the ND-GAIN score (-0.53 [-0.57 to -0.50]). The association between gender inequality and readiness was stronger than the association with vulnerability (0.40 [0.37 to 0.44] for vulnerability versus -0.67 [-0.72 to -0.61] for readiness).

Conclusions: Gender inequality measured broadly across different domains of life is associated with climate adaptation at country level, both in terms of vulnerability to impact and readiness to respond.

Key messages:

- Gender inequality, considered broadly across multiple domains of life, is associated with increased vulnerability to climate change and poor readiness to respond.
- Addressing gender inequality needs to be a priority for governments and inter-governmental organisations if populations worldwide are to adapt to climate change.

Abstract citation ID: ckae144.025
High-resolution modeling and projection of heat-related mortality in Germany under climate change

Junyu Wang

JY Wang[1], *N Nikolaou*[3], *M an der Heiden*[2], *C Irrgang*[1]
[1]ZKI-PH, Robert Koch Institute, Berlin, Germany
[2]Department of Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
[3]Institute of Epidemiology, Helmholtz Zentrum München, Neuherberg, Germany
Contact: wangj@rki.de

Heat is a leading cause of premature deaths during summer months. Understanding the relationship between high temperatures and excess mortality is crucial for designing effective prevention and adaptation plans. Traditional statistical methods have been repeatedly applied to analyze heat-related mortality. However, spatially and temporally high-resolution analyses are challenging due to fragmented data archives across different agglomeration levels, especially for mortality data. We propose a neural network-based model to estimate heat-related mortality. This approach allows for high temporal and spatial resolution estimations, such as regional heat risk during specific heatwaves. Using Germany as a case study, we calculated heat-related excess mortality rates at the district level and visualized the dynamics of local health risks within a heatwave. Overall, we estimated a total of 48,000 heat-related deaths in Germany over the last decade (2014-2023), with most occurring during specific heatwave events. For example, in 2023, the heatwave from July 7-14 contributed approximately 28% (1100 deaths) to the total of about 3,900 heat-related deaths for the entire year. This estimation is consistent with previously published reports from the Robert Koch Institute (RKI), considering the resolution differences in the input data. In addition, we combined our model with shared socio-economic pathways (SSPs) of future climate change, assuming a static population and baseline mortality rate. The results suggest that heat-related risk in Germany could further increase by a factor of 2.5 (SSP245) to 9 (SSP370) without adaptation to extreme heat. Our approach is a valuable tool for the monitoring of regional heat-related risks as well as scenario-based risks projections for the future. The results of the model can help develop climate-driven public health strategies, aiding in the identification of local risks during heatwaves and in long-term resilience planning.

Key messages:

- High-resolution modeling of heat-related mortality helps us to develop targeted adaptation and prevention plans.
- The majority of heat-related mortality occurs during heatwaves in summer.

Abstract citation ID: ckae144.026
Development of a heat mortality surveillance approach for England

Imogen Davies

E Lo[2], *R Thompson*[1]
[1]UK Health Security Agency, London, UK
[2]University of Bristol, Bristol, UK
Contact: mo.davies@ukhsa.gov.uk

Background: England's unprecedented temperatures in 2022 and 2023 highlighted the severe risks of rising global temperatures on public health. This study considers the impact of heatwave events on mortality rates, supporting the development of improved health surveillance and intervention strategies.

Methods: Firstly, heat-associated mortality for each heat episode was estimated by comparing observed daily mortality values with the expected baseline of daily deaths. Secondly, the historic temperature-mortality relationship was established at national and regional levels using a distributed lag non-linear model with temperature and mortality data from the previous 5 years. Finally, modelled estimates of heat-associated excess mortality were generated based on the historic temperature-mortality relationships, to assess any difference between observed and modelled estimates.

Results: In 2022 which saw record-breaking maximum temperatures in the UK, an estimated 2,985 (2,258-3,712) heat-associated deaths were recorded across five heat episodes, the highest annual count to date. Despite relatively cool temperatures, 2023 saw the third-highest heat-associated mortality since reporting began in 2016 of 2,295 (1,681-2,910). Comparisons between modelled and observed mortality were generally similar, but showed statistically significant discrepancies for certain heat episodes across the two summers.

Conclusions: Heatwaves have a rapid and clear impact on health, emphasising the need for effective early warning systems and interventions. The comparison of observed mortality with predictions from historic temperature-mortality relationships at regional level demonstrates the need for a nuanced approach to surveillance and health protection for adverse heat, with factors other than temperature also playing a critical role in health impacts. This will inform continuous improvements in England's impact-based Heat Health Alerting system.

Key messages:

- Heatwaves pose a significant risk to public health, as evidenced by the unprecedented excess deaths during the record-breaking temperatures in England in Summer 2022.
- Comparison of observed mortality with predictions from historic data can provide insight into contextual factors modulating the health impacts of heat, and inform future surveillance and response.

Contact: jguihenneuc.pharma@gmail.com

Introduction: Recent studies highlighted the need for climate change (CC) training in universities, especially for health students. In France, a collaborative teaching program, "Plan Health Faire" (PHF), addresses this need. This study aimed to assess PHF's impact on health students' reactions, knowledge, and behaviour.

Methods: A cross-sectional study was carried out among all second-year health students enrolled in Medicine, Pharmacy, Odontology, and Maieutics at the University of Poitiers in September 2022. During a mandatory seminar, all students took part in the innovative and scientific PHF teaching program which aims to raise awareness of the challenges of CC as applied to healthcare. Two structured questionnaires based on the Kirkpatrick evaluation model were administered before and after the course. Using a comparative statistical analysis, the changes in students' knowledge were assessed.

Results: In all, 294 students took part in the study, and 97.4% were satisfied or very satisfied with PHF. An average score of 8.6/10 was given to the collaborative dynamics of the training. In terms of changes in their level of knowledge and their perception of these changes, 98.3% of students felt that they had learned new knowledge about CC and healthcare. A comparative analysis of the answers to the knowledge questions showed that students' level of knowledge is indeed significantly higher at the end of the course ($p<0.0001$). Finally, 94% of students expressed their probable or certain intention to integrate these issues into their future professional practice.

Conclusions: These results indicate that the PHF training program has a significant impact on health students, particularly in terms of satisfaction and knowledge. PHF could be an interesting way to teach health students about the challenges of CC in healthcare. PHF is currently tested in other French Universities and health care facilities.

Key messages:

- Plan Health Faire is an innovative and collaborative educational program aimed at raising awareness among healthcare stakeholders about the challenges of climate change.
- Plan Health Faire is an effective program for raising awareness among health students about climate change and is also an interesting lever for integrating climate change into their future practice.

Abstract citation ID: ckae144.028
Exploring the relationship between energy poverty and mental wellbeing: a qualitative study

Merel Stevens

MM Stevens[1], *P Ambrosio-Albala*[2], *C van Ooij*[3], *BA Searle*[2], *N Garcia*[4], *E Rocher*[4], *L Middlemiss*[2], *A van Grieken*[1]

[2]School of Earth and Environment, University of Leeds, Leeds, UK
[3]Energy Transition Studies, TNO, Amsterdam, Netherlands
[4]Las Naves, Valencia, Spain
Contact: m.stevens@erasmusmc.nl

Background: Rising rates of energy poverty in Europe, affecting 11% of households, are a serious public health concern. The inability to meet energy needs impacts mental wellbeing, preventing people from productively engaging in society. Our objective was to explore this relationship within the context of three European cities, each characterized by distinct climatic conditions, cultural and societal characteristics and governance arrangements. This work is part of the European funded research project WELLBASED, grant no. 945097.

Methods: Semi-structured interviews ($n = 34$) were conducted with people experiencing energy poverty in the United Kingdom, the Netherlands and Spain. Purposive sampling ensured the representation of a diverse range of family and household types, gender and experiences with energy poverty. Thematic analysis was conducted using MaxQDA software.

Preliminary results: The analysis resulted in six themes: (1) worries and fear (2) stress (3) value of the home and neighborhood, (4) caring for others, (5) engaging with daily life and (6) autonomy in managing the situation and seeking for and receiving support. Participants were worried and stressed about the rising energy bills, the thermal discomfort, and health impacts of their poor housing conditions. In relation to caring responsibilities, participants were especially concerned about the impact on their children and prioritized children's needs. Participants also expressed a strong will for independence and having control over their lives, but at the same time valued being seen and supported.

Conclusions: The persistent worries, fear and stress highlight implications of failure to meet energy needs for mental wellbeing. Caring responsibilities, engaging with daily life and autonomy proved important for mental wellbeing among people living in energy poverty. Our findings call for addressing energy poverty challenges in public health programs to improve mental wellbeing of vulnerable citizens.

Key messages:

- People experiencing energy poverty in the United Kingdom, Spain and the Netherlands recognize the impact of their energy poverty situation on their mental wellbeing.
- The public health community needs to be informed and engaged about the impact of energy poverty on mental wellbeing in order to take action.

1.G. Scientific session: Forecasting dietary habits trends, human and planetary health

Abstract citation ID: ckae144.029

Organised by: EUPHA-FN, -CHR, WHO/Europe Special Initiative for NCDs and Innovation
Chair persons: Saverio Stranges (EUPHA-CHR), Mary Rose Sweeney (Ireland)
Contact: giuseppe.grosso@unict.it

Extensive research has elucidated that dietary factors are pivotal in influencing both human health and the ecological stability of the planet. Suboptimal dietary patterns are implicated in over 10 million annual fatalities attributable to non-communicable diseases. Concurrently, the agricultural sector, a major component of food production, contributes significantly to environmental degradation. This sector is responsible for more than a quarter of global greenhouse gas emissions and utilizes approximately 50% of the planet's habitable land. Moreover, it accounts for over 70% of global freshwater consumption and is a primary contributor to marine ecosystem disruption through nutrient runoff leading to ocean eutrophication. Despite these critical linkages, current global trends related to dietary practices show little alignment with the improvements needed to achieve the Sustainable Development Goals set for 2030. The existing policy framework and interventions lag considerably in addressing these concerns. Historical and ongoing discussions have repeatedly highlighted these issues, yet the allocation of resources necessary to counteract the pervasive influence of industry-driven marketing promoting less healthful dietary choices remains markedly inadequate. There is an urgent need to intensify dialogues and enhance the conceptual framework regarding the role of diet in sustaining global health and environmental integrity among public health professionals. Such measures are crucial for facilitating a shift towards more sustainable and health-promoting dietary habits globally. The EUPHA Food and Nutrition Section, the Chronic Diseases Section, in collaboration with the World Health Organization (WHO) Regional Office for Europe, aim to propose a joint workshop to share innovative research and activities held in the context of diet and environment. The workshop aims to provide new findings and stimulate the debate about the projections for the future of human and planetary health.

Key messages:

- Human health and environmental preservation require an adaptation of dietary habits globally: are we going in the right direction?
- Current evidence suggests that there is an wide area of intervention to improve actual dietary habits, reduce the environmental impact, and improve human health.

Abstract citation ID: ckae144.030
Foresight diet quality: current trends and future problems

Marialaura Bonaccio

M Bonaccio[1], *G Grosso*[2]
[1]Department of Epidemiology and Prevention, IRCCS Neuromed, Pozzilli, Italy
[2]Department of Biomedical and Biotechnological, University of Catania, Catania, Italy
Contact: marialaura.bonaccio@neuromed.it

Current evidence suggests that several aspects of diet quality is globally suboptimal. While increasing animal-based products could exert certain benefits against undernutrition in developing countries, the preference of mass-produced low-quality meat-products over other animal-based ones (i.e., milk, dairy, and eggs) and their overall excessive consumption in spite of plant-based ones has been deemed responsible, at least in part, of the rise of non-communicable diseases. The industry-led response to the growing need of animal-food alternatives may not necessarily meet the health objectives of a natural vegetable source against highly processed products rich in chemical additives. Research in this area is growing producing mixed results, while adoption of plant-based dietary patterns seems less and less equivalent to be synonymous of a healthy nor sustainable choice. In this presentation, data on the current state of evidence on global food consumption, dietary patterns, as well as the relation between level of food processing and health will be provided.

Abstract citation ID: ckae144.031
Reducing obesity and overweight: Subregional Policy Dialogues in the WHO European Region

Kremlin Wickramasinghe

J Williams[1], *I Spiroski*[1], *M Heinen*[1], *S Whiting*[1], *I Rakovac*[1], *K Wickramasinghe*[1]
[1]Special Initiative for NCDs and Innovation, WHO/Europe, Copenhagen, Denmark
Contact: wickramasinghek@who.int

In the WHO European Region, obesity and overweight stand as leading causes of disability and premature mortality. They contribute significantly to the burden of noncommunicable diseases, hindering efforts to achieve sustainable development goals related to health, including SDG goal 3.4, aiming to reduce premature mortality from NCDs by one-third by 2030. Despite some policy successes such as sugary drinks taxes, restrictions on marketing unhealthy products to children, and physical activity promotion campaigns, no country has managed to halt the rising levels of obesity. Addressing obesity requires a comprehensive approach, and WHO endeavors to support countries in implementing a wide range of policy actions across various settings. The WHO Special Initiative for NCDs and Innovation has recently adopted a subregional approach to promote evidence-based, data-informed policy action. In June 2022, it organized a series of obesity dialogues, including sessions for the Western Balkans. This session will outline the methods and outcomes of these dialogues, including stakeholder engagement, presentation of the latest obesity data, evidence-based policy recommendations, and the process of prioritizing policy options with decision-makers. It will consider the lessons learned from this process, offering insights not only for the health agenda but also for addressing other complex public health, environmental, or social challenges, which require multisectoral collaboration and comprehensive, policy actions on many levels.

Abstract citation ID: ckae144.032
Diet Impact Assessment model: an interactive tool for analysing the health, environmental and affordability implications of diets

Marco Springmann

M Springmann[1,2]
[1]Environmental Change Institute, University of Oxford, Oxford, UK
[2]Centre on Climate Change and Planetary Health, LSHTM, London, UK
Contact: marco.springmann@ouce.ox.ac.uk

Global diets, environmental factors, and health require a holistic approach in public health discourse that takes into account the well-being of both humans and planetary health. Modeling tools have demonstrated being useful to estimate priorities and differences between countries and gain insight into future paths that depend on predetermined priorities. Modeling efforts that include environmental goals indicate the possibility of reducing environmental impacts while both improving food quality and overall health outcomes, especially in high-income settings. The aforementioned forecasts highlight the effectiveness of giving priority to dietary recommendations that lead to better, balanced patterns as the most effective approach to reducing mortality risks and environmental implications. The presentation will introduce the Diet Impact Assessment (DIA) model - a new interactive modelling tool for analysing the health, environmental and affordability implications of diets and dietary change. The tool enables countries to analyse user-specific scenarios of dietary change, and to estimate the health, environmental and cost burden of each scenario in terms of diet costs, avoidable deaths, changes in resource use and compatibility with global environmental targets, including those associated with food-related greenhouse gas emissions, land use, water use and fertilizer application. The tool was commissioned by the WHO Regional Office for Europe and is based on analytical frameworks developed by Marco Springmann and colleagues.

Abstract citation ID: ckae144.033
The future of nutrition education for health systems capacity building

Giuseppe Grosso

G Grosso[1], *S Ray*[2,3,4]
[1]Department of Biomedical and Biotechnological, University of Catania, Catania, Italy
[2]NNEdPro Global Centre for Nutrition and Health, St John's Innovation Centre, Cambridge, UK
[3]School of Biomedical Sciences, Ulster University, Coleraine, UK
[4]Fitzwilliam College, University of Cambridge, Cambridge, UK
Contact: giuseppe.grosso@unict.it

In the ever-evolving landscape of global health, nutrition education plays a pivotal role in shaping the well-being of populations. The future of nutrition education encompasses a holistic understanding of health, considering not nutritional adequacy in health and disease, but also cultural, social, and environmental factors. Tomorrow's health professionals must also be equipped to address the interconnectedness of nutrition with mental health, sustainability, and community dynamics. Nutrition education will increasingly involve collaboration across disciplines. Health professionals, educators, policymakers, and community leaders must work together to create a comprehensive ecosystem that fosters nutrition literacy. This collaboration extends beyond traditional healthcare settings to schools, workplaces, and local communities. Furthermore, digital transformation will also revolutionise nutrition education. Online platforms, mobile apps, and virtual simulations will enhance learning experiences whilst interactive modules, webinars, and gamified content will engage learners and facilitate continuous professional development. Moreover, telehealth and tele-nutrition will bridge geographical gaps, ensuring access to quality education globally. Cultural sensitivity in nutrition education is also needed across geo-demographic boundaries to appreciate diverse dietary practices, food taboos, and traditional knowledge. Nutrition education should also empower health professionals to advocate for policy change across food systems, promote sustainable practices, and address food insecurity and therefore understanding policy frameworks and participating in advocacy efforts will be key. Finally, embracing the future requires a commitment to lifelong learning to remain at the forefront of nutrition science and its cutting edge as the questions may remain the same but the answers vary significantly as we garner new evidence to navigate evolving global challenges.

An analysis into the rise of private healthcare in England by geographical location and time period

Lucy McCannn

L McCannn[1], *I Holdroyd*[2], *R Emberson*[3], *H Painter*[1], *J Ford*[1]
[1]Wolfson Institute of Population Health, Queen Mary University of London, London, UK
[2]Department of Public Health and Primary Care, University of Cambridge, Cambridge, UK
[3]Barts and the London School of Medicine and Dentistry, Queen Mary University of London, London, UK
Contact: Lucy.mccann@nhs.net

Background: Private healthcare is a rapidly growing industry in the UK, particularly for surgical procedures. Across the pandemic period, waiting lists for elective surgical and consultant-led care increased from 4.4 to 7.5 million patients. This study aimed to analyse the trends and geographical variations in privately funded and NHS-funded orthopaedic private procedures across England compared to NHS waiting times.

Methods: We conducted a longitudinal study using quarterly national data between 2019 and 2023 in England. Descriptive analysis of quarterly orthopaedic surgical volumes per 10,000 people, and quarterly orthopaedic surgery wait times stratified by geographical location and time period was conducted.

Results: Between 2019 and 2023 there were a total of 1,469,450 procedures across the private sector, comprising 1,030,095 NHS-commissioned private orthopaedic procedures and 439,355 private orthopaedic procedures. The South of England performed a higher total number of private procedures per year compared to the North (63 vs 57/10,000 people); whilst there was almost double the number of privately funded procedures (23 vs 12/10,000), the difference was less amongst NHS-funded procedures (45 vs 40/10,000 respectively). There was a large variation in the number of NHS-funded procedures per 10,000 between regions. The North has consistently shorter waiting times than the South.

Conclusions: Our findings indicate considerable geographical variation in the use of private healthcare between regions, suggesting a two-tier healthcare system. The founding principles of the NHS, healthcare free at the point of use based on clinical need irrespective of ability to pay, continue to be eroded. Policy makers and politicians urgently need to find solutions to ensure all members of society can access the same high quality health care.

Key messages:

- Private healthcare utilization in the UK for orthopaedic procedures, has increased significantly, contributing to an emerging two-tier healthcare system.
- There are large geographical disparities in access to healthcare services, with he South of England performing more private proceeds with longer NHS waiting times compared to the North.

Abstract citation ID: ckae144.035
Evaluating health system resilience testing; what makes this practice successful?

Julia Zimmermann

J Zimmermann[1,2], P Haywood[3], M Karanikolos[1,4], J Cylus[1,2]
[1]European Observatory on Health Systems and Policies, London, UK
[2]LSE, London, UK
[3]University of Sydney, Sydney, Australia
[4]LSHTM, London, UK
Contact: zimmermannj@who.int

Issue: Health system resilience is an important and desirable attribute of health systems. We have evaluated the operationalization of our step-by-step guide for conducting a resilience test.

Description of the problem: Preparedness planning is often siloed and does not take the entire health system into account. The objective was to develop a new methodology for policy making that is adaptable to any health system context and shock scenario. Resilience testing uses a mixed-method approach to assess resilience by understanding health system strengths and weaknesses in relation to a hypothetical shock scenario. A programme logic model, semi-structured interviews and an online questionnaire were used to evaluate the methodology and to answer the following questions: Can resilience tests be used to identify strengths and weaknesses in different health system contexts? What are the determinants for successful resilience testing?

Results: Three resilience tests were conducted in Finland, Greece and the Asturias region of Spain. All resilience tests identified health system strengths and weaknesses. 97% of participants agreed that the test identified broader vulnerabilities. However, 76% thought that a different scenario would identify different strengths and vulnerabilities. 94% of participants agreed or strongly agreed that the test was a valuable exercise. The semi-structured interviews consistently found that successful resilience testing requires neutral facilitation and carefully selected test participants.

Lessons: Resilience test results have been used in 2 out of 3 cases to develop health policy. Resilience testing needs to be initiated and supported by the ministry of health to ensure results are considered in the policy making process.

Key messages:
- Health system resilience tests can identify health system strengths, weaknesses, and steps towards remedial policy action to improve resilience in different European health system contexts.
- Successful health system resilience testing requires carefully selected facilitators and test participants as well as support from the Ministry of Health.

Abstract citation ID: ckae144.036
System-wide health needs segmentation: innovating integrated care for complex needs households

Roberta Piroddi

R Piroddi[1,2], W Baker[3], K Daras[1], I Buchan[1], J Rafferty[3], A Astbury[4], B Barr[1]
[1]Public Health, Policy and Systems, University of Liverpool, Liverpool, UK
[2]Health Data Science, University of Liverpool, Liverpool, UK
[3]Strategy and Intelligence, NHS Mersey Care Foundation Trust, Warrington, UK
[4]Transformation, NHS Cheshire and Merseyside Integrated Care Board, Warrington, UK
Contact: rpiroddi@liverpool.ac.uk

Background: Health needs segmentation is increasingly used in healthcare delivery and health policy planning to cater for diverse population groups and develop effective and equitable health policies. But existing models often lack a systemic approach, focusing instead on single conditions or settings. This leads to fragmentation, gaps and inefficiencies in service provision and inequities in health outcomes, particularly when addressing complexity, and specifically for children, as adversity clusters in families.

Aims: To develop a household health needs segmentation model to identify those households with children with high levels of complex cross-sectoral needs, to plan for integrated care services.

Methods: Data linkage of primary, secondary, mental, community and social care services, mortality records, residential information, and small-area multiple deprivation measures was used to design a rule-based model to identifying households with children with the most complex needs in the UK region of Cheshire and Merseyside (C&M), with large variation in demography, (human) geography, and deprivation.

Results: Of 2,645,329 individuals in C&M (97% of the registered population in 2021), 1,022,840 lived in 266,939 households with children aged 0-16: 21,527 households had complex needs. This 8% of families accounted for an estimated 34% of health and social care costs for families, £362 million in total, 42% of which spent on children in care of local authorities.

Implications: The model identified a specific group of families with complex service use patterns, high mental and physical comorbidity and socioeconomic vulnerabilities. These exhibit potential for improved outcomes through better integration of services and targeting of community building and family support resources.

Conclusions: Our model represents a significant innovation in health needs segmentation. By using whole system linked data, it provides a pragmatic way of profiling complexity for proactive care.

Key messages:
- Complex health and social problems in children cluster in families with adults also having complex needs, so we need to transform fragmented services to support the whole family to improve outcomes.
- Household level segmentation using cross-sectoral, whole system data is an innovation to identify households with complex needs with respect to their locality to improve integration of support.

Abstract citation ID: ckae144.037
Maternal near-miss and mortality associated with being referred: a case control study in Luanda

Maria Castelo

M Castelo[3], P Campos[3], P Magalhães[3], C Teixeira[1,2]
[1]ESSA, Instituto Politécnico de Bragança, Bragança, Portugal
[2]EpiUnit, ITR - Instituto de Saúde Pública, Universidade do Porto, Porto, Portugal
[3]Faculdade de Medicina, Universidade Agostinho Neto, Luanda, Angola
Contact: guicastelo21@gmail.com

Background: Understanding of determinants of severe maternal morbidity is crucial for reducing Maternal Near Misses (MNM) and Maternal Deaths (MD). We aimed to assess whether being referred from lower level to tertiary-level hospitals is a determinant of MNM and MD in Luanda, capital of Angola.

Methods: A facility-based case control study was conducted (June-September 2022) at 2 referral hospitals in Luanda. Consecutive sampling for the cases (women admitted with life-threatening conditions) and systematic sampling for the controls (women admitted for vaginal delivery) was used. Cases were classified by the outcome at discharge: MD or MNM. Multivariate multinomial regression was conducted to assess whether being referred is associated with MNM and MD (controls as reference). Sociodemographic, clinical and obstetric factors and circumstances at admission related with MNM or MM (p-value <0.05) were included in the models. Reduced models (forward technic) were fitted for obtaining adjusted odds ratio (AOR) and respective 95% confidence interval (95%CI).

Results: Data from 331 cases (245 MNM and 86 MD) and 662 controls were analyzed and bivariate analysis revealed large differences between groups in regards to the sociodemographic, clinical and obstetric characteristics and circumstances of admission. The proportion of being transferred from another facility was 7.9%, 51.0% and 65.1% among controls, MNM and MD, respectively. After adjusting for pre-existing diseases during pregnancy, previous cesarean section and delay in seeking care, being referred from another facility increased the odds of MNM (AOR=10.97; 95%CI: 7.19-16.75) and MD (AOR=18.89; 95%CI: 10.50-33.89).

Conclusions: According to our findings, being referred from lower level facilities is a strong determinant of MNM and MD. Strategies for improving lower level of healthcare services and the referral system for pregnant women could have a positive impact on prevention of MNM and MD in our setting.

Key messages:

- Awareness should be given to the conditions of maternal transfer from lower level to tertiary level hospitals in Angola.
- Public health strategies should address the quality of maternal care at primary and secondary level hospitals, before maternal transfer, as well as, the maternal referral system in this setting.

Active education for reducing the attainment gap in a public health course in the United Kingdom (UK)

Marjorie Lima do Vale

M Lima do Vale[1], *J Murdoch*[1]
[1]Department of Population Health Sciences, King's College London, London, UK
Contact: marjorie.lima_do_vale@kcl.ac.uk

Background: A diverse cohort of students join our UK postgraduate public health programme. We wanted to reduce attainment gaps between students. Active and inclusive educational activities may be important mechanisms for reducing attainment gaps as well as promoting student wellbeing. Our aim was to explore how active and inclusive curriculum design could support development of public health functions (e.g., designing interventions to address health inequalities) whilst reducing attainment gaps.

Objectives: Our 12-week module included a project to model determinants of adolescent's health inequalities and design an evidence-based intervention to address determinants. Informed by Fink's taxonomy and the assessment for learning framework, we designed educational activities (i.e., small group work and presentations, ethnographic visits, discussions with stakeholders) and assessments (i.e., group poster presentation and individual critical reflection) to structure the project. We assessed attainment gaps in student marks and surveyed student attitudes to the project ($1 =$ strongly disagree; $5 =$ strongly agree).

Results: 53 students (9 groups) completed the assessment with the following marks: poster ($M = 61$, $SD = 7$), critical reflection ($M = 59$, $SD = 9$), overall mark ($M = 59$, $SD = 10$). More students received 'fails' and 'distinctions' when only the critical reflection was considered ($p < 0.001$). Students ($N = 39$; 72% response rate) agreed that activities were intellectually stimulating ($M = 5$, $SD = 0.8$), supported their learning ($M = 4$, $SD = 0.8$) and made them feel included ($M = 5$, $SD = 0.7$). Active learning approach (i.e., benefits of interactions; creating effective groups); student's caring and commitment; choice and inclusivity; complex and authentic tasks; informal, formal and timely feedback were highlighted.

Conclusions: Evidence that an active and inclusive approach functions to reduce attainment gaps is equivocal but appears to promote engagement, inclusion and learning.

Key messages:

- Active learning strategies combined with authentic and flexible tasks and rich in feedback stimulate student's interactions, inclusivity, and learning with potential for reducing attainment gaps.
- Active and authentic education requires educators to work on how to properly implement these strategies.

Background: HPV vaccine coverage (VC) remains lower than expected in many countries, particularly France. We developed and evaluated the PrevHPV multicomponent intervention to improve HPV VC among French adolescents. The components were 'education and motivation' of adolescents in schools, 'at-school vaccination', and 'general practitioners' (GPs) training'. We evaluated the effectiveness of the intervention two months after it ended.

Methods: We carried out a pragmatic cluster randomized controlled trial with incomplete factorial design in 14/25 French school districts (July 2021-April 2022). The cluster was the municipality ($n = 91$). The outcome was HPV VC (≥ 1 dose) two months after the intervention ended among 11-14-year-olds living in participating municipalities (data from the French national reimbursement database and from the trial). We performed two types of analyses: (1) without considering the dose of intervention received, using a linear model with one fixed effect per component, adjusted for baseline HPV VC; (2) a post hoc on-treatment analysis, rerunning the linear model by replacing the fixed effects with a quantitative 'dose of intervention' variable calculated for each component using data collected during the trial.

Results: For the three intervention components, estimates of the effect on VC at two months were greater for the on-treatment analyses than for the analysis that did not consider the intervention dose. For the 'at-school vaccination' component, the estimate increased from 5.50 percentage points (pp; $p < 0.001$) to 11.25 pp ($p < 0.001$). The 'GPs' training' component reached significance (from -1.46 pp, $p = 0.150$ to 3.56 pp, $p = 0.049$). In both types of analyses, no significant effect was observed for 'education and motivation' (from -0.08 pp, $p = 0.950$ to 2.58 pp, $p = 0.241$).

Conclusions: Increasing HPV VC among adolescents requires the involvement of various stakeholders and could be achieved by combining interventions in both schools and primary care settings.

Key messages:

- The PrevHPV study is supported by the French health authorities and conducted by a multidisciplinary consortium to tackle a long-lasting public health concern in France.
- Offering free HPV vaccination at school significantly increased HPV VC; providing GPs with training and a dcision-aid tool helped increase HPV VC if the GPs completed the training.

Estimated number of COVID-19 deaths averted by vaccination in Belgium

Veerle Stouten

V Stouten[1], *I Van Evercooren*[1], *C Vernemmen*[1], *T Braeye*[1], *M Billuart*[1], *L Catteau*[1], *N Bustos Sierra*[1], *E Vermeiren*[1], *L Nasiadka*[1], *J van Loenhout*[1]
[1]Epidemiology and Public Health, Sciensano, Brussels, Belgium
Contact: veerle.stouten@sciensano.be

Background: Vaccination campaigns have been rolled out globally to limit the impact of COVID-19 on severe health outcomes, including mortality. We aimed to estimate the number of averted deaths by COVID-19 vaccination in the Belgian population aged ≥65 years, between January 2021 and January 2023.

Methods: Nationwide data on COVID-19 infections, vaccinations and all-cause mortality were individually linked. We estimated Vaccine Effectiveness against COVID-19 mortality (VE) in persons having received a vaccine dose in the last 6 months using a Cox proportional hazards model adjusted for age, sex, time since vaccination, previous infection, comorbidities, province and income. COVID-19 death was defined as a death within 1-7 weeks after a positive SARS-CoV-2 laboratory-test. Based on obtained VE estimates, vaccine coverage and national COVID-19 mortality data, we estimated the number of averted deaths (expected deaths without vaccinating minus the reported deaths).

Results: By January 31st 2023, 11,033 COVID-19 deaths have been reported in Belgium. The average vaccine coverage was 48% during alpha, 85% during delta and 63% during omicron dominance. VE was estimated at 0-59 days after vaccination, for 65-79 year and ≥80 year-olds respectively, at 65% (58%-60%) and 35% (28%-41%) during Alpha, at 84% (82%-87%) and 79% (77%-81%) during Delta and at 83% (80%-85%) and 71% (68%-73%) during Omicron dominance. We estimated 10,042 deaths averted (range: 8,917-11,188) among the Belgian population aged ≥65 years, representing a 48% reduction (range 45%-50%) in the expected deaths. Out of 10,042 averted deaths, the majority was averted during Delta (47%; 4,670) or Omicron dominance (43%; 4,366), compared to during Alpha dominance (10%; 1,006).

Conclusions: Vaccinating against COVID-19 led to an important reduction in COVID-19-related mortality among the Belgian population ≥65 years, in particular during Delta and Omicron dominance, underscoring the effectiveness of vaccines against mortality.

Key messages:

- Vaccinating against COVID-19 led to an important reduction of 48% in COVID-19-related mortality among the Belgian population ≥65 years, in particular during Delta and Omicron dominance.
- Vaccine effectiveness against COVID-19 mortality was estimated as high in the Belgian population ≥65 years (range: 71-84%) during Delta and Omicron dominance, also among elderly over 80 years.

Abstract citation ID: ckae144.041
How have respiratory tract infections changed in the post-covid era for children under 5 years?

Kimberley Foley

KA Foley[1], *DS Hargreaves*[2], *JK Quint*[1], *A Bottle*[1], *A Majeed*[1], *S Saxena*[1]
[1]Department of Primary Care and Public Health, Imperial College London, London, UK
[2]Mohn Centre for Children's Health, Imperial College London, London, UK
Contact: k.foley@imperial.ac.uk

Background: Social distancing measures introduced in response to the covid-19 pandemic reduced transmission of all respiratory pathogens. Exposure to respiratory pathogens in early life affects future lung health. We aimed to describe changes in the incidence of respiratory tract infections (RTIs) in children <5 years in England in the post-pandemic era.

Methods: Population-based retrospective cohort study using electronic health records. We included all children aged <5 years registered with a primary care practice from April 2016 to March 2023. We compared monthly GP consultation rates for RTIs in the two post-pandemic years (April 2021 - March 2022 and April 2022 - March 2023) with corresponding months during pre-pandemic years (April 2016 - February 2020).

Results: There were 3 045 701 respiratory tract infections among 2 894 539 children <5 years registered with a GP practice during the study period. Pre-pandemic, monthly RTI rates varied from lows of 29.1 per 100 child-years in August to highs of 108.8 per 100 child-years in November. In 2021/22, monthly RTI rates were bimodal peaking in June and October, although the winter peak was lower than pre-pandemic years and mean monthly RTI rates were ∼15% lower overall. In 2022/23 mean monthly RTI rates remained ∼15% lower than pre-pandemic years, but there was a single peak in December 2022 of 117.6 RTIs per 100 child-years, exceeding the pre-pandemic winter peaks by 8.1%.

Conclusions: Overall, monthly RTIs in post-pandemic years were 15% lower than pre-pandemic years. However, there was a concerning peak in December 2022 that exceeded the winter peaks from previous years. Comparisons with national surveillance data suggest this peak reflects changes in RTI incidence, particularly among group A streptococcal infections, but this peak may also reflect changes in access to care or healthcare seeking behaviour. Continued monitoring of post-pandemic seasonal patterns will assist in planning for health service use.

Key messages:

- Respiratory tract infections in children <5 years in post-pandemic years were 15% lower than pre-pandemic years, but winter peaks in incidence may be of greater magnitude in the post pandemic era.
- Ongoing monitoring of patterns of respiratory tract infections in young children is important for future health service planning and delivery.

Abstract citation ID: ckae144.042
Vaccine conspiracy beliefs are the main determinant of adult vaccine hesitancy

Mariusz Duplaga

P Smola[1], *U Zwierczyk*[1], *K Kowalska-Duplaga*[2], *M Duplaga*[1]
[1]Department of Health Promotion and e-Health, Jagiellonian University Medical College, Cracow, Poland
[2]Department of Pediatrics, Gastroenterology, Jagiellonian University Medical College, Cracow, Poland
Contact: mariusz.duplaga@uj.edu.pl

Background: Many factors influence the level of vaccine hesitancy. The COVID-19 pandemic demonstrated that conspiracy beliefs are an important element of overwhelming misinformation. The main aim of the study was to assess the relationship between vaccine hesitancy (VH) and vaccine conspiracy beliefs (VCB) in Polish society.

Methods: The analysis was conducted using data from an online survey of 2189 Internet users conducted in November 2021. Uni- (ULRM) and multivariable linear regression (MLRM) models were developed for vaccine hesitancy as a dependent variable. The independent variables included VCB score (VCBS), health (HL) and e-health literacy (eHL), Internet (IU) and social media use (SMU), political views (PV), and sociodemographic variables.

Results: The VCBS, eHL, HL, age, income, vocational and marital status, place of residence, PV, IU, and SMU were significant predictors of VH in ULRMs. A significant relationship with VH was maintained in MLRM for all independent variables enlisted earlier, apart from age, income, and vocational status. Respondents with higher VCBS were more likely to have higher VH (B, 95%CI: 0.38, 0.37-0.40). Those with undetermined HL had higher VH than persons with sufficient HL (B, 95%CI: 0.13, 0.06-0.20). A higher level of eHL predicted a lower level of VH (B, 95%CI: -0.01, -0.012 - -0.03). Lower IU and higher SMU were associated with higher VH (B, 95%CI: 0.16, 0.02-0.30, and 0.10, 0.03-0.17, respectively). Supporters of far right-wing party showed higher HV than supporters of the governmental party (B, 95%CI: 0.16, 0.07-0.27). Finally, singles showed higher HV than married (B, 95%CI: 0.07, 0.01-0.13), and residents of small cities had higher HV than residents of rural areas (B, 95%CI: 0.08, 0.004-0.15).

Conclusions: The vaccine conspiracy beliefs play a major role in the development of VH. The interventions aimed at the change of anti-vaccination attitudes should address the problem of widespread conspiracy beliefs.

Key messages:

- Conspiracy beliefs are an important determinant of attitudes toward vaccination.
- The development of adequate digital health literacy may be a protective factor against vaccine hesitancy.

Mother-to-child Transmission using the National HBV Perinatal Prevention Data in Korea, 2002-2021

Moran Ki

M Ki[1], BW Kim[1], D Baik[1], JH Kim[2]

[1]Cancer Control and Population Health, National Cancer Center Graduate School of Cancer Science and Policy, Goyang, South Korea
[2]Pediatrics, College of Medicine, The Catholic University of Korea, Seoul, South Korea
Contact: moranki@ncc.re.kr

Aims: To define risk factors associated with mother-to-child transmission (MTCT) and to create supporting evidence for the National Hepatitis B Perinatal Prevention Program (HBPPP) in Korea.

Methods: We analyzed HBPPP mother-infant pair data enrolled from 2002 to 2021. The major outcome was the HBsAg status of the infant resulting from post-vaccination serological testing. Additionally, we used prescription records of antivirals against the hepatitis B virus (telbivudine, tenofovir disoproxil fumarate) from 2010 to 2021 by data linkage with the National Health Insurance claims data. To select significant risk factors by maternal HBeAg status based on the data from 34 to 42 weeks of pregnancy, multivariate logistic regression analysis was used.

Results: Data from 232,242 mother-infant pairs were analyzed. Among 154,331 (66.5%) infants with post-vaccination serological testing results, 3,620 (2.3%) were HBsAg-positive. The incidence of MTCT has shown a decreasing trend, from 4.1% in 2002 to 1.0% in 2021. However, the rate was high at 5.5% (1822/32986) for infants of HBeAg-positive mothers. Maternal antiviral prescription during the pregnancy period, old age, HBeAg negative, delivery type (C-section), and breastfeeding were significant factors in decreasing the risk of MTCT. Among the HBeAg-positive, there was a significant difference in the antiviral prescription 0.7% (11/1692) compared to the non-prescription 4.9% (789/16264) [aOR, 7.71; 95% CI, 4.24-14.02]. The result was similar for the HBeAg-negative group, 0.7% (302/44888).

Conclusions: To eradicate the hepatitis B virus on a national level, MTCT must be further reduced. To achieve this, it is necessary to introduce strong additional preventive measures, including quantitative HBV DNA testing for mothers with chronic hepatitis B and administering antiviral prophylaxis at the third trimester of pregnancy with HBV-DNA $\geq$200,000 IU/mL into the HBPPP.

Key messages:

- The incidence of mother-to-child transmission has shown a decreasing trend, from 4.1% in 2002 to 1.0% in 2021.
- Maternal antiviral prescription, old age, HBeAg negative, delivery type (C-section), and breastfeeding were significantly decrease the risk of mother-to-child transmission.

1.K. Scientific session: Health literacy of children and adolescents across Europe

Abstract citation ID: ckae144.044

Organised by: EUPHA-HL, -HSR
Chair persons: Jany Rademakers (Netherlands), Orkan Okan (EUPHA-HL)
Contact: j.rademakers@nivel.nl

Health literacy is developed throughout the life course. Enhancing health literacy at an early age is especially important since it may impact both current and future health skills and outcomes. Low health literacy in child and adolescent populations has been linked to worse health outcomes and health disparities in Europe, making health literacy of children and adolescents an important public health topic. Developing and delivering targeted interventions and services for these age groups requires insight and data on the development and state of health literacy in early age. However, child and adolescent health literacy is still an under-researched topic. This is partly due to a lack of appropriate measurement instruments and methods to involve children in research. In the past years, new studies on child and adolescent health literacy have emerged in several European countries. In this workshop, innovative studies from Germany, the Netherlands and the UK on HL in childhood and adolescence are introduced and discussed. Both methodological findings as well as empirical data will be presented. In Germany, an instrument to measure child health literacy was developed and validated for primary school children. This instrument, the HLS-Child-Q15, has been used both in Germany and in the Netherlands to study the relationship between children's health literacy and their health behaviors and outcomes. In the UK, methods of involving primary school children in health literacy research were studied. Experiences with a Children's Advisory Group will be shared.

Another study in the Netherland focuses on the health literacy profiles and needs of adolescent patients with rheumatic diseases. The format of this workshop will be 4x10-minute presentations (including questions) followed by a 20-minute interactive discussion, reflecting on the relevance of these results to further research, health promotion and health services. which will be followed by Q&A and an open discussion with the audiences. This workshop offers a forum for researchers, health educators, practitioners and policymakers interested in health literacy measurement and research in children and adolescents.

Key messages:

- Child and adolescent health literacy is an important, yet under-researched public health topic.
- Child health literacy is an important predictor of their health behavior and outcomes.

Abstract citation ID: ckae144.045
The influence of health literacy on health outcomes and behaviors in fourth-graders in Germany

Torsten Michael Bollweg

TM Bollweg[1], O Okan[1]
[1]Department of Health and Sport Sciences, Technical University Munich, Munich, Germany
Contact: torsten.bollweg@tum.de

Background: For the adult population, evidence suggests that a high level of subjective health literacy is associated with a number of favorable health outcomes and behaviors. However, for younger populations, particularly children, little evidence is available. This study investigates the relationship between subjective health literacy, health outcomes, and health behaviors in children.

Methods: We conducted a representative survey of 4th-grade students (age 8-11) in North Rhine-Westphalia, Germany, between Oct. 2022 and Feb. 2023. Subjective health literacy was measured with the HLS-Child-Q15 questionnaire. For mental and physical well-being, the KINDL-R was used. For health behaviors, we asked about the frequency of (1) brushing teeth, (2) eating fruit and (3) vegetables, (4) exercising, (5) consuming sweetened drinks, and (6) wearing a helmet when riding the bike. Regression analysis was used to determine the impact of health literacy on outcomes, controlling for a number of sociodemographic indicators (birthplace, home language, sex, age), as well as the tendency to give socially desirable responses. Health behaviors were rated on a Likert scale and where dichotomized for ordinal regression.

Results: $n = 1085$ students are included with a mean age of 9.5 years (SD=.6). 50.3% are female. While controlling for a number of variables, health literacy was a significant predictor ($p<.05$) for every indicator except the frequency of (1) brushing teeth, (4) exercising, and (5) consumption of sweetened drinks. For mental well-being, health literacy was the strongest predictor.

Conclusions: Our findings highlight the potentially enabling role of subjective health literacy regarding favorable health outcomes and health behaviors. However, because this is a study among younger children, further research is needed on the interplay of individual subjective health literacy, social contexts (e.g., parental health literacy and health behaviors), and children's health outcomes and behaviors.

Abstract citation ID: ckae144.046
First insights in children's health literacy in the Netherlands–results in a sample of 8-11 year olds

Jany Rademakers

J Rademakers[1,2], M Hahnraths[2], T Bollweg[3], O Okan[3], M Willeboordse[4], M Heijmans[1]
[1]NIVEL, Utrecht, Netherlands
[2]CAPHRI, Maastricht University, Maastricht, Netherlands
[3]Department of Health and Sport Sciences, Technical University Munich, Munich, Germany
[4]Mulier Instituut, Utrecht, Netherlands
Contact: j.rademakers@nivel.nl

Background: There are few valid, age-appropriate tools to assess children's HL. The German-language European Health Literacy Survey Questionnaire Adapted for Children (HLS-Child-Q15-DE) is a self-report questionnaire adapted from the adult European Health Literacy Survey Questionnaire. In 2021, this instrument was translated and validated in the Netherlands. In this presentation, we will describe the distribution of Health literacy in a sample of Dutch children, and relate their Health literacy level to certain aspects of their health behaviour such as food intake and physical activity.

Methods: The HLS-Child-Q15-DE was translated following WHO guidelines and administered digitally to 209 Dutch schoolchildren (eight-to-eleven-year-olds). Its psychometric properties were assessed and the sample's HL distribution was explored by demographic characteristics. Associations with food intake and physical activity were computed.

Results: Of the sample, 17.2% had a low health literacy score (first quintile), 61.1% medium (second to fourth quintile) and 21.7% high (fifth quintile). Higher HL scores were observed for ten-to-eleven-year-olds (compared with eight-to-nine-year-olds; $p = 0.021$) and fourth-grade students (compared with third-grade; $p = 0.019$). A positive association between children's HL and their vegetable consumption and PA behaviour was observed.

Conclusions: Children's health literacy can have an impact on some aspects of their lifestyle. This supports the idea that health literacy evolves throughout life and stresses the importance of both parents and schools in this process.

Abstract citation ID: ckae144.047
Involving children in health literacy research

Catherine Jenkins

C Jenkins[1]
[1]Institute of Health and Social Care, London South Bank University, London, UK
Contact: jenkinc8@lsbu.ac.uk

Background: The range of health literacy research related to children has not normalised children's involvement as advisors in health literacy research about them. While research with children can be difficult to facilitate, the principles of involvement and engagement should guide all health literacy work. This presentation shares learning from convening a Children's Advisory Group to consult children about health literacy research priorities, ethics and methods.

Methods: Children (n-8) aged 7-11, referred by adults whose networks included children, joined a Children's Advisory Group as Child Advisors. Consultations focused on a proposed study of how children's critical health literacy could be supported in a community setting. Child Advisors piloted methods for rapport-building and data collection to be adapted for use with child participants later. Child rights-informed evaluation forms captured children's reflections on their involvement.

Results: Consulting with a Children's Advisory Group has challenges and benefits. Despite equity-focused strategies, e.g. introductory phonecalls and postcard updates, seldom-heard children remained less involved and the extent of parent/caregiver support varied. Child Advisors valued independent consultations led by their interests. Contributions included child-friendly consent documents, live-streamed draw-and-describe inspired by favourite influencers, and a novel Interview to the Alien protocol designed to appeal to middle childhood.

Conclusions: Taking an equity-focused approach is relevant for research with children focused on critical health literacy. Consulting with Child Advisors provides a way to involve children in health literacy research that holds adult researchers accountable for acting on children's contributions. It is important to offer Child Advisors more than one option to get involved in research so that their insights can be foregrounded in future health literacy research with children.

Health literacy challenges of young adults with rheumatic diseased in the transition to adult care

Mark Matthijs Bakker

A Scharmga[1], *M Bakker*[1,2,3], *S Gorter*[1,3]
[1]Department of Internal Medicine, Division of Rheumatology, Maastricht University, Maastricht, Netherlands
[2]Department International Health, Maastricht University, Maastricht, Netherlands
[3]CAPHRI, Maastricht University, Maastricht, Netherlands
Contact: m.bakker@maastrichtuniversity.nl

Background: For young people living with a chronic illness (such as rheumatic diseases), transitioning from youth to adult care is a challenging process requiring adequate health literacy (HL). Insight into the specific HL-challenges of young people with rheumatic diseases could contribute to preventing loss to follow-up, and improving medication adherence, health outcomes, and social participation.

Methods: A mixed-methods study was conducted among young adults (16-25 years old) living with rheumatic disease in the Netherlands. Participants were recruited at two clinics and through social media of patient initiatives. Quantitative data were digitally self-reported using the Health Literacy Questionnaire (HLQ) and Medication Adherence Report Scale (MARS). Qualitative data were collected through semi-structured interviews. Hierarchical cluster analysis of HLQ-data was used to identify health literacy profiles, uncovering strengths and weaknesses. Interview transcripts were analysed using content analysis and used to explore health literacy needs and confirm the HLQ results.

Results: Sixty-two participants completed the questionnaire and ten participants were interviewed. Six HL-profiles were identified, representing diverse strengths and weaknesses. Having sufficient information, social support, and critical appraisal were challenging across profiles. Some participants (particularly in profile 3) reported difficulties in taking medication. The interviews confirmed the quantitative findings and unveiled HL needs across seven categories, particularly the need for in-depth information and support, with a focus on (social) aspects of having a chronic illness as a young person.

Conclusions: HL-challenges of young adults with rheumatic diseases are similar to adult populations, but age-specific needs exist. The results can inform development of HL-responsive rheumatology services, for example during consultations or at the transition clinic.

1.L. Scientific session: Public Health data in support of healthy ageing policies

Abstract citation ID: ckae144.049

Organised by: School of Public Health University of Pavia (Italy), EUPHA-HA, -ECO, -DH
Chair persons: Anna Odone (EUPHA-DH, -IDC), Zoltan Ungvari (Hungary)
Contact: gvigezzi@hotmail.com

As Europe grapples with an ageing population, the imperative of health policies that promote healthy ageing is increasingly critical. This workshop aims to explore the significant role of public health data in shaping and supporting such policies. By integrating insights from administrative records to sophisticated research infrastructures, we will highlight the multifaceted uses of data in public health, particularly in the realms of non-communicable diseases and health-related behaviours in older populations. The session will open by examining how administrative records have been utilised within Lombardy's regional health system to understand the epidemiology and access to care for people living with dementia. The discussion will then cover the advantages and challenges associated with integrating health data from diverse sources, emphasising the importance of quality, privacy, and the potential for real-time surveillance and response systems in healthcare. Following this, the focus will shift to the determinants of good health among older adults, presenting findings from a comprehensive cross-sectional study that identifies key factors contributing to what can be termed as "superhero" health status: seniors who maintain excellent physical and mental health. This analysis will delve into socioeconomic, behavioural, and environmental factors that influence health outcomes in the elderly, providing evidence-based recommendations for public health interventions and highlighting the potentialities of ad hoc surveys in examining health outcomes during emergencies. Thirdly, the workshop will also address the impact of significant life transitions on health behaviours, specifically the transition to retirement and its effects on alcohol consumption. Leveraging longitudinal data from a pan-European multidisciplinary research infrastructure, it will be demonstrated how retirement affects daily habits and lifestyles, including changes in alcohol consumption patterns. This segment will explore the implications of these findings for public health planning and policy formulation. In conclusion, there will be a discussion about healthcare system policies that support healthy ageing and the global impact of ageing on economics and health economics. These discussions will draw from the presented data sources and studies to suggest ways in which public health policies can be designed to reduce disparities and improve overall health outcomes among the elderly. This workshop is designed to provide a comprehensive overview of how data-driven insights can inform effective public health strategies and interventions to support an ageing society. By exploring various aspects of health data application, from individual behaviour to systemic policy adjustments, the session aims to highlight the critical role of data in promoting sustainable health and well-being in older adults, especially in the context of increasing life expectancy and prolonged retirement periods.

Key messages:

- Harnessing data from diverse sources is crucial for understanding and enhancing healthy ageing processes.
- Utilising longitudinal studies and robust data to design informed public health policies is essential for effective ageing interventions.

Abstract citation ID: ckae144.050
Administrative data for public health: a regional data warehouse applied to dementia epidemiology

Timo Clemens

T Clemens[1], L Blandi[1,2], P Bertuccio[2], H Brand[1], A Odone[2,3]
[1]Department of International Health, CAPHRI, Universiteit Maastricht, Maastricht, Netherlands
[2]Department of Public Health, Università degli Studi di Pavia, Pavia, Italy
[3]Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: timo.clemens@maastrichtuniversity.nl

Administrative data can represent valuable sources of information for researchers seeking to advise policymakers. Several countries have established population-based data warehouses (DWH), integrating multiple data sources in single repositories through data linkage techniques. In Lombardy (Italy), a regional population-based DWH was established in the 1980s. It collects data about citizens from multiple sources in the social and health sectors, anonymising them immediately after their acquisition. Lombardy Region signed a specific agreement with the University of Pavia to investigate the epidemiology and access to care among people living with dementia (PLWD), using the DWH. A retrospective cohort study was conducted on hospitalised PLWD, including people aged $\geq$ 65 years with diagnoses of dementia at discharge from 2002 to 2020. The aim was to study the trends of hospitalisations among PLWD, computing these by calendar year, age, sex and cause of hospitalisation. A total of 340,144 hospital discharges were registered, of which 211,709 (63.0%) were women and 124,195 (37.0%) were men. The rate of hospitalisation decreased over the study period, ranging from 100.6/10,000 in 2002 to 65.1/10,000 in 2020. The average age at hospitalisation increased for men and women from 78.9 and 81.8 years in 2002 to 82.0 years and 84.2 years, respectively, in 2020. Respiratory diseases caused 10.4% of all hospitalisations in 2002 and grew steadily to 26.8% in 2020, becoming the leading cause of hospital admissions since 2017. Results allowed us to elaborate epidemiological measures and to characterise our population in a wide temporal trend, quantifying access to acute care by leading causes of hospitalisation. However, the analysis of administrative data comes along with several challenges, such as data incompleteness and biases. Researchers should take advantage of these data sources while keeping in mind the limitations and constraints related to data quality.

Who are the superheroes? A cross-sectional study on the determinants of healthy ageing

Giansanto Mosconi

People who reach old age while enjoying good physical and mental health are, in a sense, 'superheroes' (of health): in fact, they not only have a relatively low impact on health care spending but are also advantaged in playing an active role in society and achieving their aspirations (and perhaps helping others to do so). The aim of this study was to assess the prevalence and determinants of being 'physical superheroes' (i.e., lacking the 10 major chronic conditions plus obesity), 'mental superheroes' (i.e., lacking major mental symptoms) and 'superheroes' (i.e., both mental and physical superheroes). We used data from a telephone-based cross-sectional study (LOST in Lombardia) conducted in November 2020 (i.e., during the COVID-19 pandemic) on a representative sample of 4,400 adults aged $\geq$65 years from the Lombardy region, Northern Italy. All the participants provided data both during and before the COVID-19 pandemic. Mental and physical superheroes were 59.0% and 17.6%, respectively. Superheroes were 12.8% overall, 15.1% among men and 11.1% among women; 20.2% among individuals aged 65-69 years, 11.3% among 70-74, 10.0% among 75-79, and 8.3% among $\geq$80 years. Multivariable analysis showed that, besides female sex, higher age, and disadvantaged socio-economic status, ever tobacco smoking (adjusted odds ratio, aOR=0.71), alcohol drinking (aOR=0.77), and physical inactivity (p for trend<0.001) were inversely related to being superheroes. Participants with feelings of hopelessness showed an extremely low presence of "superheroes" (OR = 0.17). The COVID-19 pandemic reduced by 16.3% the proportion of superheroes. Given a steadily ageing population, public health policies should aim to ensure that people reach old age in the best possible state of health by preventing risky behaviours and paying special attention to inequalities derived from economic and social factors.

Impact of the transition to retirement on alcohol consumption: a longitudinal analysis within SHARE

Giacomo Pietro Vigezzi

Contact: gvigezzi@hotmail.com

In an ageing society, the impact of retirement on behavioural risk factors and health status needs to be carefully assessed. Evidence on the short-term and long-term effects of retirement on alcohol consumption are contrasting and inconsistent. A longitudinal study was conducted based on data from the Survey on Health, Ageing and Retirement (SHARE) collected between 2004 and 2020 in 27 European countries and Israel. A repeated measure generalised estimating equation (GEE) model was fitted to estimate the relative risks (RR) and corresponding 95% confidence intervals (CI) of alcohol consumption (frequency, quantity, and binge drinking) at different time periods before and after retirement. We selected a cohort of 8,998 individuals who were employed at baseline and retired during follow-up (median follow-up: 9 years; maximum: 16 years). Compared to the year of retirement, the RR for habitual daily or near-daily drinking was 0.88 (95%CI 0.76-1.02) 10 years before retirement and 0.92 (95%CI 0.83-1.02). This pattern reversed post-retirement with a RR of 1.12 (95%CI 1.01-1.23) 3-4 years after retirement and 1.28 (95%CI 1.11-1.48) 10 years or more after retirement. No significant changes in the consumption of high volumes (more than 8 units of alcohol) were observed: while the frequency of regular drinking might increase post-retirement, the instances of heavy episodic drinking do not necessarily rise. Additionally, a reduction in occasional heavy drinking episodes was noted both before (RR 0.86; 95%CI 0.77-0.95, 5-9 years prior) and after retirement (RR 0.78; 95%CI 0.66-0.93, more than 10 years after). These findings underscore the complexity of alcohol use behaviours in the context of retirement. The increase in regular drinking post-retirement might be attributed to changes in daily structure, social interactions, or coping mechanisms for life transitions. The decline in binge drinking suggests a shift towards more moderated consumption patterns as individuals age.

1.M. Scientific session: Young and lonely – exploring experiences, challenges, and potential solutions

Abstract citation ID: ckae144.053

Organised by: Defactum (Denmark)Chair persons: Julie Christiansen (Denmark), Anne Friis Bo (Denmark)
Contact: julie.christiansen@stab.rm.dk

Experiencing loneliness is a natural facet of human existence, often considered a normative aspect of adolescent life. However, for some adolescents, this experience evolves into a 'vicious circle' of prolonged loneliness, making it challenging to reconnect with their social environment. This issue is important given the significance of fulfilling social relationships during adolescence. Peer relationships are particularly important in facilitating various developmental processes such as identity formation, asserting of autonomy from parental influence, and acquisition of social skills. Loneliness among adolescents is notably high, as evidenced by mounting research highlighting its prevalence in this age group surpassing other age groups. Research spanning adulthood and old age consistently demonstrates loneliness as a risk factor for both mental and physical health outcomes, including stress, depression, chronic diseases, and premature mortality. Even during adolescence, loneliness is associated with adverse mental and physical health, with potential long-term consequences extending into adulthood. These findings underscore the imperative of addressing adolescent loneliness and the need for effective interventions and widespread solutions tailored to this demographic. This workshop aims to address adolescent loneliness, exploring their experiences, challenges, and the consequences of loneliness, while also addressing possibilities for mitigation and prevention. Through three presentations followed by a joint discussion with the audience, participants will gain important insights into this critical issue. The workshop will be chaired by Asst. Prof. Julie Christiansen (Defactum - Public Health Research, Denmark, and University of Southern Denmark). Julie Christiansen will provide an introductory overview, describing current knowledge of adolescent loneliness including prevalence, ascendants, and consequences, based on findings from the Danish National Health Survey (How are you?"). The first presentation will be given by Lily Verity (University of Manchester, UK), who will present the findings from a qualitative research study with adolescents highlighting factors that influence their approach to coping with loneliness. Following this, Prof. Mathias Lasgaard (Defactum - Public Health Research, Denmark, and University of Southern Denmark) and Dr. Anne Friis Bo (Defactum - Public Health Research, Denmark) will provide an overview of the intervention landscape, including current knowledge on the effectiveness of various intervention strategies. The presentation will also highlight the potential of community-based approaches. This will be exemplified through an introduction to the Danish initiative 'More Together' including 36 partners in Silkeborg Municipality. Lastly, Ph.D. student Lauren Burke (University of Manchester, UK) will present the findings from a comprehensive systematic review and meta-analysis of loneliness interventions for children and adolescents.

Key messages:

- The prevalence of loneliness among adolescents surpasses that of other age groups, substantiated by extensive research spanning nations.
- Loneliness during adolescence is potentially modifiable through targeted interventions.

Considerations for coping with loneliness from the perspective of young people

Lily Verity

L Verity[1]
[1]Manchester Institute of Education, University of Manchester, Manchester, UK
Contact: lily.verity@manchester.ac.uk

Adolescence is a time characterized by high friendship instability. Adolescents have to navigate changes to their social worlds alongside developmental challenges such as identity formation. It makes sense then, that loneliness is a common experience during adolescence. For most, loneliness is transient and can be adaptive; it motivates individuals to strengthen their social relationships by seeking connection and evaluating existing relationships. For some, loneliness becomes chronic leading to heightened risk of additional mental health issues such as depression and anxiety, and physical health issues such as cardiovascular disease. Extant interventions to help youth cope with loneliness have been developed based on quantitative research and may be missing qualitative insights that can expand our understanding by identifying the decisions made by young people when determining how to cope. Exploring the lived experience of adolescents who are navigating loneliness can complement quantitative work by identifying preferred coping strategies, and barriers to coping adaptively. This presentation will focus on qualitative research with adolescents highlighting factors that influence their approach to coping. Drawing from insights gathered from 13 focus groups with young people aged 8-24 years in the UK, the presentation will discuss key themes developed to describe the process by which youth determine how to cope, the influence of their underlying reasons for feeling lonely, coping strategies that help to alleviate loneliness, and strategies which are counterproductive.

Abstract citation ID: ckae144.055
Challenges and possibilities in adolescent loneliness interventions

Mathias Lasgaard

M Lasgaard[1,2]*, A Friis Bo*[1]*, J Christiansen*[1,2]
[1]Public Health Research, Defactum, Aarhus, Denmark
[2]Department of Psychology, University of Southern Denmark, Odense, Denmark
Contact: Mathias.Lasgaard@stab.rm.dk

Researchers typically associate the high prevalence of loneliness during adolescence with evolving dynamics and changes in relationships, both familial and peer-related. Consequently, transient feelings of loneliness are anticipated and considered part of the normative developmental process. While many adolescents naturally navigate through periods of loneliness by reconnecting with peers, a subset experiences prolonged feelings of loneliness. This group faces an increased risk of additional mental health issues and potential adverse health consequences. Such findings underscore the importance of effective and scalable interventions. This presentation draws upon a comprehensive meta-analytical review of loneliness interventions and a dedicated chapter in the upcoming Cambridge Handbook of Loneliness. focusing on interventions for adolescents. It will offer a brief overview of contemporary loneliness interventions and intervention strategies. Furthermore, it will discuss the unique considerations required when addressing loneliness in adolescents compared to other age groups. This includes the critical importance of loneliness prevention for adolescents, particularly within the school environment. Furthermore, the presentation will discuss the potential of community-based interventions aimed at tackling adolescent loneliness, showcasing the ongoing Danish community-based intervention ‘More Together.’ ‘More Together’ is a large-scale, complex, multi-component and multi-level intervention for community change that aims to reduce loneliness among young and elderly people. The intervention is rooted in an extensive cross-sector partnership. The presentation will highlight potentials and pitfalls encountered when addressing adolescent loneliness within a community setting.

Interventions to reduce loneliness in children and adolescents: A systematic review and meta-analysis

Lauren Burke

L Burke[1]
[1]Manchester Institute of Education, University of Manchester, Manchester, UK
Contact: lauren.burke-2@postgrad.manchester.ac.uk

Despite the growing focus on adolescent loneliness and loneliness interventions, our understanding of successful approaches for tackling loneliness in childhood and adolescence remains limited. While recent reviews have made advances in exploring loneliness interventions for this age group, our understanding of successful approaches remains limited. Key knowledge gaps persist, particularly concerning potential moderators - specifically, the characteristics that may determine the effectiveness of an intervention is sparse, leaving a significant gap in our understanding of which interventions are most effective and for whom. This presentation aims to fill this gap by presenting the findings of a systematic review and meta-analysis on interventions to reduce loneliness in children and adolescents. The presentation will provide a brief overview of the methodology employed and provide insights into the characteristics of the interventions reviewed, including an assessment of their overall effectiveness in alleviating loneliness. The primary focus, however, will be on presenting findings regarding the effectiveness of interventions across different participant groups, including variations based on socio-economic status, age group, pre-existing mental and physical health conditions, as well as baseline levels of loneliness. Additionally, the presentation will explore the impact of different intervention strategies on the effectiveness of loneliness interventions for children and adolescents. Lastly, the presentation will offer reflections on avenues for future research and practice based on the findings.

1.N. Scientific session: Child injuries monitoring and reporting: Challenges and technological developments

Abstract citation ID: ckae144.057

Organised by: EUPHA-INJ, -CAPH, EuroSafe IDB network
Chair persons: Maria Papadakaki (EUPHA-INJ), Julia Dratva (EUPHA-CAPH)
Contact: mpapadakaki@hmu.gr

Globally, more than 1,600 children and adolescents below the age of 19-years die every day from preventable injuries. Road traffic injuries, drowning and self-harm represent leading causes of death and injury among children and adolescents (WHO 2021; WHO Regional Office for Europe, 2021; Unicef, 2021). Most unintentional injuries in early childhood occur at home and children from less advantaged backgrounds are exposed to more hazardous home environments due to overcrowding or unsafe structures over which parents often have limited control (WHO, 2020). According to the IDB data analysis approximately 15% of home injuries could have been prevented by improved product safety and parental education. The COVID-19 pandemic and the conflict in Ukraine have created a complex and challenging situation for children and adolescents in the region, increasing their vulnerability and compromising their well-being. To efficiently prevent child injuries, one must account for a complex interplay between human factors as well as physical and socio-cultural environments. Multiple determinants of child injury cannot be addressed by the health sector alone, this is why a whole-of-government and a whole-of-society approaches are required. Schools have a crucial role to play for promoting the well-being of children and serve as a platform to increase access to health services. However, EU countries are still missing intersectoral collaboration and strong information systems to enable efficient response to the problem. Data on child injuries are still inconsistently collected in Europe due to substantial differences in coding systems, variation between injury mechanisms, different general policies pertaining to the admission of patients, and legal policies on reporting requirements. EU-wide networks such as the Eurosafe study (IDB network) collecting information on child injuries, are scarce. Likewise, access to healthcare services and support systems are unevenly distributed, particularly in underserved communities. Building country capacity in collecting, analysing and increasing the use of child injury data for decision making at global, regional, and national levels, is critical. Adequate epidemiological data on the burden of child injuries are necessary to allow governments prioritize areas for intervention and maximize the impact of their resources. Utilizing evidence-based tools and procedures and promoting intersectoral collaboration is vital. The workshop aims to discuss trends and inequalities of injury burden and present efficient measures and latest developments in monitoring and reporting child injuries across EU countries. The workshop will further discuss the methodological challenges in collecting and analysing data on child injuries. Evidence-informed tools for sharing health information and improved measurements of injury burden that are feasible and usable in both research and clinical contexts will be presented and success stories will be presented.

Key messages:

- There is an EU-wide need for epidemiological data on the burden of child injuries.
- Validated tools, well-designed injury data management systems and standard data collection procedures are missing.

Background: The CHILD Vigilance project is a European study supported by the Injury Prevention section of the European Public Health Association and aims at contributing to the epidemiological knowledge of injuries and accidents in Greece, Portugal and Lithuania, through increasing knowledge on parents' and caregivers' safety perceptions.

Methods: A descriptive, observational, cross-sectional study was developed in these countries between February and April 2023, under the CHILD Vigilance project. Information was collected online via a questionnaire exploring parents' and/or caregivers' knowledge, attitudes and risk perception towards prevention of unintentional injuries in children and adolescents.

Results: A total of 916 valid responses were obtained, involving 1229 children (51.4% male; mean age 7.8 years). Falls were perceived as the most common type of unintentional injuries in pre-schoolers and school-age children (47,8% in Greece; 63,5% in Portugal; 74,8% in Lithuania). Country differences were observed in terms of the most commonly perceived types of injury in adolescents, which were road traffic crashes in Greece and Portugal (41.2% and 39.5% respectively) vs poisonings in Lithuania (38.1%). Some differences were also observed between these countries as to the most common causes of death. In Greece and Lithuania diseases were reported as the main cause of death in pre-schoolers (62.5%; 35.1%) and in children attending primary education (55.1%; 29.7%), while injuries were identified as a cause only in the oldest group of children. In Portugal on the other hand, injuries were identified as the most frequent cause of death in all groups, pre-schoolers (40.5%), children attending primary education (47.1%) and in the oldest (55.1%).

Conclusions: The study emphasizes the need to address misperceptions, improve safety attitudes and invest more efforts in managing harmonised injury outcomes across global initiatives.

[5]Medical Faculty, University of Basel, Basel, Switzerland
Contact: feer@zhaw.ch

Pediatric injuries are common and associated with individual suffering and costs for the healthcare systems and society. The incidence of injuries among children in Switzerland has so far been insufficiently monitored. Emergency department patient records can be a valuable database to assess medically relevant injuries and gain information for monitoring and evidence-based prevention. The talk will outline our stepwise development of a machine-learning program for a pediatric injury monitoring system and lessons learnt. In this feasibility study we draw on electronic case histories of children treated for injuries between 2018 and 2022 at the University Children's Hospital Zürich emergency department (N= to 30'884). The ML- approach follows different steps: step 1. utility evaluation of electronic pediatric patient records regarding ML and injury monitoring and prevention requirements in a test-sample of 100 electronic pediatric case histories; step 2. choice/adaptation of coding tree; step 3. coder training and inter-coder reliability testing; step 4. manual annotation of a sub-sample (n 1000) of the electronic pediatric patient records, step 5. design and testing of the ML program in an iterative process, and step 6. performance testing in a random sample of pediatric patient records. First lessons learnt indicate that electronic case history data contain relevant data and fulfill requirements for monitoring and prevention purposes. The IDB coding system proved too complex and detailed for the pediatric data base, providing too few examples for the ML-learning process, and needed to be adapted. Initial data analyses indicate the majority of cases are classified as less severe (73%) and only few (<1%) as very severe but the later provide the most detailed data. ML is a promising approach and makes use of hospital data for a national monitoring of pediatric injuries in Switzerland.

Background: While injuries remain a leading cause of childhood death, increasing proportions of children survive life-threatening injuries. However, robust epidemiological data on their risks of long-term disability are scant, undermining comprehensive injury control efforts. This population-based prospective cohort study investigated the functional status and health-related quality of life of seriously injured Australian children over a 5-year period.

Methods: Patients aged <18 years hospitalised for major trauma (Injury Severity Score >12) in the State of Victoria over a 12-month period were followed-up at 6, 12, 24, 36, 48 and 60-months post-injury. Primary outcomes were assessed using the PedsQL, King's Outcome Scale for Childhood Head Injury and the Glasgow Outcome Scale-Extended. Multivariable regression models investigated factors associated with outcomes.

Results: Of the 186 participants, 71% were retained to 60 months post-injury. At five years post-injury, only 39% had fully recovered while 39% experienced moderate to severe disability. Despite gains in functional status across the five years, psychosocial recovery lagged improvements in physical health. Factors associated with adverse outcomes included older age at injury, female sex, socio-economic disadvantage, remote/regional (versus urban) residence, pre-existing comorbidities, and injuries deemed compensable, intentional, or involving head trauma.

Implications: The high risks of long-term disability following serious childhood injury highlight the need for robust injury control efforts that monitor and address the inequitable burden of childhood injury, including the social determinants influencing the occurrence as well as sequelae following injury.

Paediatric injuries are widely acknowledged as a major public health issue among different medical disciplines. In the context of injuries and accidents, the surrounding environment of children and young people remains a major health concern. The present study was developed to extend current knowledge on the characteristics and magnitude of home and leisure accidents in this population. A descriptive, observational, cross-sectional study was developed under the EU-IDB (European Injury Database) collaborative network comprising up to 25 European countries and ten years of data collection (2012 to 2021). The methodology of the EU-IDB is a well consolidated standard for collecting injury data in Emergency departments, in compliance with the Eurostat methodological requirements for European health statistics. During the ten years of data collection in emergency departments, through EU-IDB surveillance 3 603 975 episodes of home and leisure accidents (HLA) were recorded at European level, involving people aged 0-19 years, constituting 34.5 % of hospital ED attendances due to HLA. Children and young people between 10 and 14 years old represented the major age group proportion of HLA(33.0%), the proportion of HLA increased across age groups until fourteen years old, being these differences statistically significant($p < 0,001$). Falls were the most common cause of injuries among all age-groups, in the youngest group up to 4-years(54.4%), the 5-9years old (52.2%), the 10-14years old (46.1%) and in the oldest group between 15-19 years(37.5%), representing 47.2% of the total HLA mechanism. As regards to the treatment/follow-up, the vast majority of the HLA episodes were not admitted to hospital (92.9%). Hospital ED Injury data represent very useful information on the health burden of non-fatal injuries in this population of interest. These data could be used for the design of injury prevention policies and regulations for accidents that occur at home, school and outdoor spaces.

1.O. Scientific session: Trans & Gender-Diverse Individuals' Mental & Behavioral Health Risks & Intervention Needs

Abstract citation ID: ckae144.062

Organised by: EUPHA-SGMHChair persons: Arjan van der Star (EUPHA-SGMH), Lovro Markovic (EUPHA-SGMH)
Contact: avanderstar@sdsu.edu

Transgender and gender-diverse (TGD) individuals are at a greater risk for various poor mental and behavioral health outcomes than cisgender individuals, including higher rates of suicide, psychiatric diagnoses, and behavioral health problems. For example, research has documented a seven-fold increased risk for lifetime suicide attempts among young TGD people, compared with the general population. Less is known about the age of onset of such mental and behavioral health disparities and how these disparities may vary across other intersectional socio-demographic variables. It has been well-documented that trans and gender-diverse individuals often encounter discrimination and transphobia across various social, educational, professional, administrative, and healthcare settings. This discrimination, as highlighted in the literature, frequently poses obstacles to accessing both general and trans-specific healthcare services due to experiences of discrimination (e.g., misgendering, refusal of care, lack of adequate services). The right and ability to self-determine and the accessibility to gender-affirming care without discrimination are key to closing the gap in TGD individuals' mental and behavioral health outcomes, and for them to live authentically and thrive. Tailored and affirming mental and behavioral health interventions to reduce these health inequities are pivotal for TGD individuals to achieve the highest attainable standard of physical and mental health: a key fundamental human right. Considerable gaps in the literature remain concerning the onset and determinants of gender identity-based health disparities and healthcare approaches that are respectful, inclusive, non-pathologizing, and grounded in human rights principles for TGD individuals. This workshop intends to address these knowledge gaps by delving into the mental and behavioral health needs of TGD individuals. The workshop seeks to further foster dialogue on strategies to overcome resistance to implementing approaches that uphold the human rights and well-being of these communities. Dr. Richard Bränström (Karolinska Institutet) will present a study that explores the age at which gender identity-based disparities in psychiatric diagnoses and treatment can be first identified. Dr. Gonzales (Vanderbilt University) will examine disparities in mental health and social determinants of health among TGD individuals with private insurance. Dr. Moleiro (Lisbon University Institute) will review TGD persons' ways of identifying with the choices and trajectories in social, legal, and affirmative healthcare processes in Portugal. Dr. Lelutiu-Weinberger (Columbia University School of Nursing) will present findings from a study that assessed tobacco use and cessation attitudes, facilitators, and barriers to quitting, and intervention components and delivery modality acceptability among TGD individuals, as well as sexual minority individuals, in Romania to inform a tailored and affirming smoking cessation intervention.

Key messages:

- Transgender and gender-diverse are at increased risk for a variety of poor mental and behavioral health compared with the general public.
- There is a critical need to foster healthcare services for transgender and gender-diverse individuals that are tailored and affirming.

Introduction: Gender minority (GM; i.e., trans, non-binary, and other gender diverse) individuals have an increased risk of mental health disorders, but few studies have explored disparities using population-based samples or the age of onset of this risk.

Objectives: The aim of the current study was to identify the age at which the gender identity disparity in physician-assessed psychiatric diagnosis and treatment for common mental health disorders can be first identified in a population-based sample linked to national health care registries.

Methods: All individuals aged 16 to 25 (n = 18,793) participating in the nationwide probability-based Swedish National Public Health Survey in 2018, 2020, or 2021 were included in the analyses. This sample could be linked to mental health care treatment history data in nationally comprehensive health care registries starting at age 8 years old.

Results: Individuals reporting a GM identity in adulthood were seven times more likely to having been diagnosed with depression and/or anxiety and about five times more likely to having been diagnosed with a neurodevelopmental disorder during childhood or adolescence compared to individuals with a cisgender identity. GM individuals' increased likelihood of being diagnosed with depression and/or anxiety was significantly elevated from age 13, while their neurodevelopmental disorder diagnosis risk was significantly elevated from age 10, compared to cisgender individuals.

Conclusions: The results from this study are the first population-based evidence to show that GM individuals are more likely to be diagnosed and treated for mental health disorders early during childhood and adolescence compared to cisgender individuals. The early emergence of this increased risk requires further inquiry into causes of these early disparities. It also suggests a potential benefit of interventions that facilitate social belonging and inclusion and reduce stressors related to societal expectations of gender.

Disparities in Mental Health and the Social Determinants of Health Among Privately Insured Transgender Patients in the United States

Gilbert Gonzales

G Gonzales[1], *J Wilder*[1], *N Tran*[1]
[1]Department of Health Policy, Vanderbilt University, Nashville, TN, USA
Contact: gilbert.gonzales@vanderbilt.edu

Objectives: The purpose of this study was to examine disparities in mental health and the social determinants of health (SDoH) among privately insured transgender and gender minority (TGM) patients in the United States.

Methods: Data came from FAIR Health, a repository of private health insurance claims data covering over 150 million individuals in the United States. TGM patients (n = 274,479) were identified with medical claims that included a diagnosis for gender dysphoria or gender identity disorder. A random 5% selection of cisgender patients (n = 7,456,823) was used as a comparison group. We estimated descriptive statistics and used multivariable logistic regression models to compare health outcomes between TGM and cisgender patients.

Results: TGM patients were more likely to have anxiety (odds ratio [OR]=7.02; 95% confidence interval [CI]=6.94-7.09), depression (OR = 9.27; 95% CI = 9.16-9.37), post-traumatic stress disorder (OR = 9.03; 95% CI = 8.86-9.21), and substance use disorder (OR = 2.93; 95% CI = 2.86-3.00) compared to their cisgender peers. TGM patients were also more likely to have problems with education and literacy (OR = 5.95; 95% CI = 5.64-6.28), employment (OR = 3.67; 95% CI = 3.44-3.92), economic circumstances (OR = 5.74; 95% CI = 5.39-6.12), and social exclusion (OR = 7.35; 95% CI = 6.91-7.81). Compared to TGM patients living in states with transphobic policy environments, TGM patients in states with comprehensive protections from discrimination fared better.

Conclusions: We found wide disparities in mental health and the SDoH among privately insured TGM. More research is critically needed to better understand the health and social needs of TGM populations. Meanwhile, policymakers should consider enacting policies that would prohibit discrimination against TGM people throughout the SDoH – or the conditions where we live, learn, work, play, and age. Health care providers should also receive education on the unique health needs of TGM patients to advance health equity.

Abstract citation ID: ckae144.065
Self-determination and self-affirmative paths of trans* and gender diverse people in Portugal: Diverse identities and healthcare

Carla Moleiro

C Moleiro[1], *V Alarcão*[2], *G Pinheiro*[1], *A Giami*[3]
[1]Centre for Psychological Research, Iscte-Instituto Universitário de Lisboa, Lisbon, Portugal
[2]Centre for Research and Studies in Sociology, Iscte-Instituto Universitário de Lisboa, Lisbon, Portugal
[3]CESP/INSERM U1018, Hôpital Paul Brousse, Villejuif, France
Contact: Carla.Moleiro@iscte-iul.pt

Background: Trans* and gender diverse (TGD) people are very heterogeneous. While legal contexts and healthcare practices have been growingly endorsing self-determination and consent for gender affirmative care in some countries, gender affirmation trajectories need to be understood as unique and fluid processes, constructed and negotiated by each individual in a given social and cultural context. This study aimed to characterize diverse profiles of TGD people in Portugal, regarding individual choices and trajectories in social, legal, and medical gender affirmative processes.

Methods: A questionnaire, first developed in France and used in Brazil, Italy, Norway, and Chile, was adapted to the Portuguese context. The conducted survey is comprised of 120 questions, organized into six sections: 1) sociodemographic variables; 2) gender affirmation processes and medical and psychological care; 3) general health and sexual health; 4) mental health; 5) sexuality and sexual concerns; 6) experiences of discrimination and gender identity. Data were collected from a convenience sample of 115 adults who identified as TGD. Content analysis was performed on the written responses, and later categorized.

Results: Approximately 21% of people identified as men, 17% as trans men, 7% as women, 12% as trans women, 26% as non-binary persons, and 17% as agender or other identifications. Differences were calculated among profiles of TGD participants and their choices for affirmative care, social, and legal transition, revealing an association between the way people self-identify and the request for legal recognition of gender identity, as well as the choices of procedures (or aspirations) for medical affirmation (i.e., hormonal treatments, top surgery, bottom surgery).

Conclusions: The provision of health care practices consistent with the principles of self-determination requires training of health care professionals and adjustment of public policies, to allow for unique trajectories and profiles.

Abstract citation ID: ckae144.066
Development of a first intervention for tobacco cessation for sexual and gender minority individuals in Romania

Corina Lelutiu-Weinberger

C Lelutiu-Weinberger[1]*, P Matthews*[1]*, A Zavodszky*[1]*, L Hightow-Weidman*[2]
[1]School of Nursing, Columbia University, New York, NY, USA
[2]College of Nursing, Florida State University, Tallahassee, FL, USA
Contact: cl4265@cumc.columbia.edu

Background: Data on tobacco use among SGM in Romania indicate high use rates, yet tailored smoking cessation efforts do not exist. We collected data from SGM individuals in Romania on tobacco use and cessation attitudes, facilitators and barriers to quitting, and intervention components acceptability to inform the first smoking cessation intervention for SGM in Romania, adapted from a U.S.-based intervention with mobile app support.

Methods: SGM individuals ($\geq$ 18 years old, current smokers) recruited through community outreach in March 2024 completed a brief assessment and participated in a focus group regarding tobacco use, attitudes, norms, risks knowledge, facilitators and barriers to quitting, and intervention acceptability.

Results: Focus groups were held with 36 participants characterized as 45% cis male, 40% gender-diverse, 15% cis female; 40% gay, 33% bisexual, 10% queer, 8% pansexual; 6% lesbian, 3% heterosexual; M age=27, SD = 7.62. 70% smoked daily; median age of first cigarette was 17. Participants reported smoking up to 2 packs a day, with 50%-98% of people in their circles being smokers. Common reasons for smoking included to alleviate stress and "fit in." Most did not receive support to quit from their social circles or within healthcare. While smoking was communal, quitting was individual and siloed, suggesting a preference for a group-based intervention, along with robust strategies to replace the function of smoking with adaptive habits. The app was evaluated positively, especially for its daily smoking tracking, reminders for alternative healthy activities, positive achievements, and forum for support.

Conclusions: Findings provide a solid platform for creating a first smoking cessation intervention for SGM individuals in Romania. Next steps include iterative testing of the mobile app to examine comprehension, usability, and satisfaction with content and functionality, in preparation for a randomized controlled trial testing the intervention's efficacy.

1.P. Round table: How could a perfect monitoring and response system look like?

Abstract citation ID: ckae144.067

Organised by: Social Physics and Complexity Lab (Portugal)
Chair persons: Joana Gonçalves-Sá (Portugal), Ana Bento (USA)
Contact: joanagsa@lip.pt

Robert FitzRoy, captain of the Beagle, was ridiculed when he started to assemble a network of telegraphs to be able to follow storms at sea: in the 19th century, predicting the weather, even in the short term, was considered impossible. 150 years later, meteorological institutes around the world may have helped prevent millions of deaths. Dynamic and complex systems are particularly difficult to predict: we still don't know exactly when the glaciers will collapse, when the next variant of a virus will appear, how intense the next earthquake will be. In fact, and as the COVID-19 pandemic has shown, most services are unprepared to adjust to such fast evolving-situations: in general, we are limited to trying to react and adapt, but systematically fail at prediction and planning, with important consequences. Moreover, disease outbreaks, scientific research, public health response(s) and legislation happen at completely different time scales, and are not prepared to communicate with (or even understand) each other. Therefore, a fundamental question is how we can create structures that, similar to what FitzRoy imagined, are prepared to anticipate and respond to health threats, when they appear. During this round table, we will bring together experts that use different perspectives (One Health, Digital Epidemiology, Health Policy) and discuss what is needed to build the "perfect" system, in an ideal world. We will argue in favor of 1) creating efficient systems for collecting and processing good quality data, fundamental for any decision making; 2) training multidisciplinary teams to work on the full pipeline from performing complex analyses, using mathematical and computational tools, to communicating with the decision-makers and the population; 3) prepare institutions to network, nationally and internationally; and 4) simulate different scenarios and design medium-term strategies. We will recognize and highlight many of the challenges of such an integrated approach, from data availability and sharing, to communicating under uncertainty, but also the risks of not even trying to do so. We expect to make very brief presentations, to leave abundant time for audience feedback and discussion.

Key messages:

- It is urgent to create structures prepared to anticipate and respond to health threats. These should be local but integrated at the international level.
- Their creation faces many challenges, from data collection and sharing to decision making and communication, that should be recognized and tackled using multidisciplinary, integrative approaches.

1.Q. Round table: Primary healthcare workforce crisis in Europe: global policy discourse and national implementation

Abstract citation ID: ckae144.068

Organised by: European Observatory on Health Systems and Policies, WHO European Centre for Primary Health Care, WHO Collaborating Centre for Health Workforce Policies and Planning, EUPHA-HCW
Chair persons: Michelle Falkenbach (Germany), Ellen Kuhlmann (EUPHA-HCW)
Contact: e.kuhlmann@em.uni-frankfurt.de

Background: Primary healthcare (PHC) has emerged as a powerful global concept, but little attention has been directed towards the pivotal role of the healthcare workforce and the diverse institutional setting in which they work. Recent WHO efforts have underscored the challenges in aligning the global PHC-oriented model with national health systems, highlighting the need for tailored approaches to fulfil diverse needs and contexts. Although significant progress has been made in advancing PHC, some gaps persist, particularly surrounding the integration of PHC and healthcare workforce debates and its prioritisation within national health agendas. These gaps lead to disconnects between PHC policy implementation and workforce considerations, exasperating the existing workforce crisis and obstructing effective service delivery.

Objectives: This workshop bridges the gap between PHC workforce policy and the ongoing healthcare workforce crisis, focusing on the European region and different types of health systems, socio-economic conditions, health labour markets and workforce compositions. We apply a health system and multi-level governance approach, arguing the need for greater attention to the implementation of global policy concepts and the diverse national and regional conditions, interests, and needs. The workshop begins with an overview of the PHC workforce situation, presenting novel results drawn from European comparative research and nine selected country case studies, followed by a panel discussion. The panellists provide in-depth evidence on various PHC workforce challenges and introduce illustrative examples of policy interventions and good-practice models coming from the case countries. Insights from the WHO Centre for Primary Health Care advance the debate by highlighting strategies and capacity for transformative PHC workforce policies, and the need for further investigation to critically align global and national approaches. The policy recommendations emerging from the panel will be critically reflected in a plenary discussion. The workshop will stimulate debate and improve knowledge exchange across countries, in particular in the WHO European region, as well as between research, policy and practice. It will strengthen both the PHC model and the healthcare workforce, and finally advance the building of resilient health systems.

Key messages:

- Shift the primary healthcare debate from idealistic attributes to actionable implementation strategies, emphasising policy dynamics, political contexts, and diverse stakeholder interests.
- Understand the various PHC-oriented models and their dynamics to determine the necessary quantity, competencies, and composition of HCWs and how they can be governed effectively to implement PHC.

Background: The healthcare workforce crisis strongly affects the primary healthcare sector, worsening the work conditions of healthcare workers and hampering service delivery and health system resilience. This study introduces a health system and governance approach to identify transformative capacities in health system contexts.

Methods: A qualitative comparative methodology was employed, and a rapid assessment of the primary healthcare workforce was conducted across nine countries: Denmark, Germany, Kazakhstan, Netherlands, Portugal, Romania, Serbia, Switzerland, and the United Kingdom/ England.

Results: Our findings reveal both convergence and pronounced diversity across the healthcare systems, with none fully aligning with the ideal attributes of primary healthcare suggested by WHO. However, across all categories, Denmark and the Netherlands, and to a lesser extent also Kazakhstan, depict closer alignment to this model than the other countries. Workforce composition and skill-mix vary strongly, while disparities persist in education and data availability, particularly within Social Health Insurance systems. Policy responses and interventions span governance, organisational, and professional realms, although with weaknesses in the implementation of policies and a systematic lack of data and evaluation. The WHO primary healthcare model only marginally informs policy decisions, but it may receive some more attention in Kazakhstan.

Conclusions: We conclude that aligning primary healthcare and workforce considerations within the broader health system context may help move the debate forward and build governance capacities to improve resilience in both areas.

2.A. Practice session: Policy labs: getting public health research into policy and practice

Abstract citation ID: ckae144.070

Organised by: The Policy Institute King's College London (UK)
Chair persons: Harriet Boulding (UK), Tianne Haggar (UK)
Contact: harriet.boulding@kcl.ac.uk

The process of translating health research into policy and practice benefits is often too slow, taking an average of 17 years globally. Additionally, health policy changes fail when they have an inadequate understanding of the communities and challenges they seek to address. The Policy Institute at King's College London has developed an innovative 'Policy Lab' method, which convenes diverse policy and practice stakeholders such as health workers, patients and policymakers, to discuss a policy challenge, assess the evidence and co-produce viable policy options. The proposed workshop introduces this method in a practical, impactful session aimed at helping participants from any country and research background mobilise their research to improve health outcomes. Policy Labs have been shown to be highly successful method. Previous Policy Lab outcomes include influencing changes to the Mental Health Act in the UK, new international guidance on treatment of type 2 diabetes, and a global coalition on paying for prevention in dentistry. The method can be adapted to different health challenges and considers the potential for change in local, national and international arenas. The workshop teaches this method in a way that enables researchers to apply it to their own work, harnessing the potential of research to improve health outcomes.

Objectives of the workshop: The workshop aims to teach people the skills to design and run a Policy Lab so that they can better mobilise their research into policy and practice.

Participants will learn: To develop policy-relevant questions from their research; Stakeholder mapping; To design a policy lab agenda; To develop a research engagement plan.

What is the added value of the workshop? The workshop teaches an innovative method that helps researchers greatly increase the policy impact from their work. It provides attendees with practical tools to employ in their own work and bridge gaps between their research and policy and practice changes.

The format of the workshop will involve a short presentation on Policy Labs by facilitators, followed by four brief interactive activities for participants, as follows: Facilitator presentation: (10 mins) Introducing the Policy Lab method; Group work 1: (10 mins) Developing a policy-relevant question; Group work 2: (10 mins) Stakeholder mapping; Group work 3: (10 mins) Designing a lab agenda; Group work 4: (10 mins) Developing a research engagement plan. We have allowed 10 minutes to adapt to any arising demands, as well as to bring the session to a close with some key messages. Participants will be guided by the facilitators, and we will use template handouts for participants to complete during the session to reinforce learning. The handouts also ensure that those who wish to work independently rather than in groups may do so if preferred, and will provide participants with the practical tools necessary should be they arrive late or need to leave early.

Key messages:

- Policy Labs are an effective way for researchers to have policy and practice impact with their work.
- Participants will learn how to run a successful Policy Lab, and improve their research impact.

Abstract citation ID: ckae144.071

Introducing the Policy Lab Method

Alexandra Pollitt
The Policy Institute, King's College London, London, UK
Contact: alexandra.pollitt@kcl.ac.uk

The workshop will begin with a brief presentation providing an overview of the Policy Lab method. The presentation will address how to develop a policy-relevant question from research, introduce stakeholder mapping, and introduce techniques for designing a lab agenda and engagement material. This introductory presentation will lay the groundwork for the practical sections of the workshop in which participants will explore these techniques.

2.B. Scientific session: Learning from intercountry comparisons in digital healthcare transition monitoring

Abstract citation ID: ckae144.072

Organised by: NIVEL, Università Cattolica del Sacro Cuore (Italy), University of Copenhagen (Denmark)
Chair persons: Gemma Williams (UK)
Contact: j.keuper@nivel.nl

In many countries, healthcare is facing several challenges, including increasing healthcare demand, healthcare workforce shortages, rising healthcare costs, and keeping healthcare accessible. It is thought that the use of digital health might help to tackle these challenges. However, digital health programs and interventions are often not (systematically) monitored or evaluated. Monitoring of the digital healthcare transition in countries over time helps policymakers and healthcare professionals to investigate which digital services work well, and which do not, to (partly) solve the experienced challenges. In Europe, several countries monitor the digital healthcare transition within the primary and secondary care in their country. Comparing and sharing the monitoring methodologies between countries and describing the current state of the digital healthcare transition in primary and secondary care, will help to learn from other countries about how digital health could help to tackle the frequently experienced healthcare challenges. During this workshop, three countries throughout Europe (the Netherlands, Italy and Denmark) will briefly share their methodologies used for monitoring the digital healthcare transition in their country and will provide an up-to-date overview of the current state of the digital healthcare transition in primary and secondary care in their country. Challenges, achievements and future plans for the monitoring of this transition will also be shortly discussed in 10-minute presentations. Further, there will be 25 minutes for audience interaction which will be moderated by the chairperson. During this discussion, there is time to hear experiences from other countries and explore best practices in monitoring the digital healthcare transition.

Key messages:

- The digital healthcare transition can be monitored in different ways. Experiences from three European countries may inspire others to organize national monitoring programs.
- The speed and nature of the digital healthcare transition differs between European countries. Experiences from three European countries provide insight into state of the art of national transitions.

Abstract citation ID: ckae144.073
Monitoring the digital healthcare transition in the Netherlands: Challenges, achievements and future

Jelle Keuper

JJ Keuper[1], *LHD van Tuyl*[1]
[1]Organisation and Quality of Healthcare, NIVEL, Utrecht, Netherlands
Contact: j.keuper@nivel.nl

Since 2013, the Netherlands Institute of Health Service Research, along with other Dutch research institutes, has monitored the digital healthcare transition in The Netherlands. Through annual surveys of both healthcare professionals (from primary and secondary care) and users (patients as well as the general population) from 2013 to 2023, trends in digital health utilization and experiences have been tracked. Overall, there has been a steady increase in digital care adoption since 2013, but in 2023, growth among professionals stabilized while slightly rising among users. Some tools saw significant increases, like automatic medicine dispensers and home monitoring, freeing up nurses' time. Utilization patterns differ among patients according to their educational attainment and age, showing lower usage rates among older individuals and those with lower levels of education. Most professionals, especially nurses, view digital care positively, but they recognize its limitations in solving healthcare challenges entirely. Healthcare professionals believe it offers only a limited contribution to cost management, workload reduction, and job satisfaction and emphasize the need for seamless integration into routine care. User opinions are divided, with those with chronic conditions often expressing skepticism. Both professionals and patients agree that personal experience is crucial in determining its value. Additionally, ensuring user-friendliness and clarifying reimbursement for digital healthcare are essential. This workshop provides an overview of developments in the Netherlands and a discussion of challenges, achievements, and prospects. Particular attention will be paid to the monitoring of digitalization progress and effects, and the use of digital solutions in primary and secondary care.

Abstract citation ID: ckae144.074
Monitoring the digital healthcare transition in Italy: Initiatives, metrics and feedback from Primary Care Physicians

Fidelia Cascini

F Cascini[1], *FA Causio*[1], *A Melnyk*[1]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
Contact: fidelia.cascini1@unicatt.it

Italy's healthcare sector has undergone significant digital transformation since 2008, driven by national strategies and reforms overseen by the Ministry of Health, the Ministry of Economy and Finance, and the Agency for Digital Italy. Key initiatives include the establishment of centralized booking systems, electronic health records (EHR), ePrescription, dematerialization of medical reports and disease certificates, patient summary, and telemedicine services. Despite regional variations, progress in the EHR adoption has been notable. Ongoing investments under the 2021 National Recovery Plan aim to further enhance digital healthcare infrastructure by 2025 through the involvement of the Italian National Agency for Regional Healthcare Services (AGENAS). Currently, Italy monitors progress through comprehensive measurement frameworks tracking digital health initiatives' implementation and impact. These encompass indicators reported quarterly by public healthcare facilities regarding the implementation of patient portals, regional registries, network infrastructure, regional EHR systems (i.e., n° of users), and digital laboratory reports. In parallel, we conducted a cross-sectional survey assessing knowledge, opinions and concerns among primary care physicians (PCPs) following the 2022 reform, which introduced Community Hospitals, Community Houses, and telemedicine in primary care. The survey highlighted mixed opinions and insufficient knowledge among PCPs regarding the novelties. Clearer communication and coordination with territorial services appears necessary. Many GPs are engaging in telemedicine, but digital literacy gaps remain, as only 35.7% believed they had necessary digital literacy. This is an insight into Italy's digital health roadmap, mainly involving primary care and focusing on achievements, challenges, and future prospects in utilizing digital solutions across healthcare settings.

Abstract citation ID: ckae144.075
Monitoring the digital healthcare transition in Denmark: Challenges, achievements and future

Karsten Vrangbaek

K Vrangbaek[1]
[1]Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: kavr@sund.ku.dk

Denmark is often mentioned as one of the countries that have introduced digital solutions early and extensively within the health care sector, including the launch of health portal sundhed.dk in 2003, the introduction of the e-record system 'e-Journalen' in 2007, and the establishment of a national infrastructure for telemedicine in 2012. Denmark is well advanced in digital health measurement, providing opportunities for researching the digital transition and its effects for healthcare organizations and Danish citizens. Most digital health data is collected through national population-based databases and registries. Additionally, annual surveys of health professionals and biennial surveys of citizens' use of health IT are conducted. Recent data show that all general practitioners use electronic health records, mainly for receiving laboratory test results from hospitals, ordering prescriptions at pharmacies, exchanging records, and sending referrals to hospitals. This workshop provides an overview of developments in Denmark and a discussion of challenges, achievements, and prospects. Particular attention will be paid to the monitoring of digitalization progress and effects, and the use of digital solutions in primary and secondary care. Issues about implementation and evaluation of digital infrastructure will be discussed with examples from Danish health care. A key question is whether digital solutions can fulfill their promise of supporting integrated and home based health care in an era of changing demographics.

2.C. Round table: A Pandemic Treaty to deliver global health equity: negotiating under a ticking clock

Abstract citation ID: ckae144.076

Organised by: EUPHA-GH, -LAW, -IDCChair persons: Elena Petelos (EUPHA-HTA, -GH), Amandine Garde (EUPHA-LAW)
Contact: elena.petelos@med.uoc.gr

Access to medical countermeasures (vaccines, therapeutics, diagnostics), fair resource allocation and a global health framework to counter future pandemics are to be provided for by the Pandemic Treaty, intensely debated in the Intergovernmental Negotiating Body (INB) over the past two years. The final negotiations round began under tremendous pressure (Apr 29, 2024), with dissonance on structural treaty elements and a ticking clock to finalise the text at the World Health Assembly (end of May 2024). At a time of shifting geopolitical powers, in a year of elections across the world, war in Europe and rising defence expenditure, countries are reluctant to commit; the draft postpones key decisions, proposing to establish two intergovernmental working groups for instruments on One Health and prevention, and on a Pathogen Access and Benefits (PABS), with technology transfer and capacity-building remain largely unaddressed, despite COVID-19 lessons. With EU and G7 countries holding to their positions on surveillance, financing, and intellectual property (IP), negotiations will continue. A more critical question remains: will the Treaty's be adequate and timely enough to meet the challenges of inevitable future pandemics? Will it deliver the global framework of its foundational purpose of equity and justice? This RT aims to inform and involve the European public health community, continuing the series of activities embarked upon at the beginning of the pandemic, empowering its members for evidence-informed advocacy and concerted action. Following a brief presentation on the Treaty's key provisions, each panel member will deliver a brief (2-3 min) intervention based on core expertise, with two rounds of panel questions/statements to follow, and with an interactive element to prioritise and submit questions. The first elaborating on the current provisions, linking them to the key expertise of panel members, i.e., international and EU law, public health law, One Health and infectious disease control, global health policies, technology transfer, fair pricing and access to countermeasures. The second examining what can be achieved via evidence-informed advocacy, and with a special focus on the role of the European public health community. Has it been well represented so far in negotiations? Should it be more involved? Is it well equipped to provide expert advice to Europe's policymakers? Is there complementarity in relation to Europe's Global Health Strategy (GHS) and national global health plans? Finally, the role of WHO will be briefly debated. How can sovereignty be safeguarded without compromising implementation? What is the role of transparency and sound governance to remain in line with national and EU laws and priorities? The last five minutes of this RT will be used to consolidate messages and share plans to inform future formal EUPHA positioning in negotiations.

Key messages:

- Pandemic accord deliberation has have taken place under extreme urgency and geopolitical pressure. The European public health community must be informed and engaged for EU and country-level advocacy.
- At a time of permacrisis, the adoption of a global framework for fair resouce allocation, access to medical countermeasures,and to strengthen health systems for future pandemics is urgently needed.

Accessibility of digital healthcare in 2023: insights from a Dutch national survey study

Lilian Van Tuyl

L Van Tuyl[1]*, J Keuper*[1]*, L Standaar*[2]*, E Alblas*[2]*, B Keij*[2]
[1]NIVEL, Utrecht, Netherlands
[2]RIVM, Bilthoven, Netherlands
Contact: l.vantuyl@nivel.nl

Background: Digital technology is reshaping healthcare, offering potential improvements in accessibility, efficiency and quality. However, to realize potential benefits, ensuring equal access for all is crucial. We investigated digital healthcare usage and studied differences in use across age groups and educational backgrounds in the Netherlands.

Methods: Surveys were conducted among general healthcare users (n = 837, any citizen living in the Netherlands with access to healthcare) and healthcare users with chronic conditions (n = 1437). We studied their digital skills (can you independently use a computer, tablet or smartphone; digital applications; email and apps?) and their use of digital selfcare (did you use websites for health-related information or treatment?). Findings are stratified for educational level (low/medium/high) and age (15 -39, 40-64, over 65 years). Data collection occurred between April and August 2023, focusing on the twelve months preceding the survey.

Results: The majority of respondents use digital devices independently (range: 78-91%), but these percentages vary between subgroups, from 48-65% for users with lower education vs 86-99% for users with higher education. Similar differences exist across age groups: 98-100% of users aged 15-39 use a computer, tablet or smartphone, in contrast with 59-78% in the over 65 years age group. Similarly, the use of websites for health information is 22-31% among lower educated users to 68-70% among higher educated users; and 36-48% among those $\geq$65 years to 73-75% among respondents aged 15-39.

Conclusions: Substantial variation exists in the use of digital tools and digital selfcare across ages and educational levels. These findings underscore the urgency of addressing inequalities in access to digital healthcare, serving as a call to action for policymakers, healthcare providers, and developers to collectively strive for an accessible (digital) healthcare system for all.

Key messages:

- Differences in use of digital tools and digital selfcare among people of different ages and educational levels warrants the need for co-creation and tailored development and implementation.
- Differences in use of digital tools and digital selfcare among people of different ages and educational levels warrants the need for co-creation and tailored development and implementation.

Background: Territorial health inequalities are of growing concern in countries with universal health systems. From 2003, three successive national cancer plans were launched in France, aiming to improve prevention and treatment. Regions in France are responsible for strategic and financial management of healthcare within their boundaries, which, until 2016, included up to 8 departments. In this study, we analyze the evolution of between and within-region territorial inequalities in breast cancer mortality over 50 years.

Methods: We used direct and indirect standardization to analyze trends in breast cancer mortality for women aged 25 to 74 years between 1968 and 2017 in each department of metropolitan France. We analyzed the evolution of relative inequalities over time using standard errors of age-adjusted rates. We used multilevel Poisson regression to estimate how much the regional level contributed to territorial variation.

Results: Over the period 1968 to 1992, breast cancer standardized mortality ratios (SMRs) increased (+16%) while relative territorial inequalities decreased (-21%). After 1997, SMRs decreased (-23%) but territorial inequalities remained unchanged. In 18 out of 22 regions, inequalities were lower at the end than at the start of the study period. Period proved to be the most important determinant of variation in mortality. However, multilevel models also suggested that the regional level explained most of the remaining variation in each period (from 50% to over 80%).

Conclusions: Over the study period in most French regions, breast cancer mortality has decreased, and so have relative inequalities. Nevertheless, there is evidence that regions have performed differently. The proportion of variation explained by the regional level suggests the continued relevance of the health system on breast cancer mortality.

Key messages:

- Territorial inequality in breast cancer mortality has decreased in France over the 1968-2017 period.
- In most regions, disparities between departments have decreased.

Did social inequalities in child development change during the COVID-19 pandemic in Germany?

Stephanie Hoffmann

S Hoffmann[1,2], *M Tschorn*[3], *J Spallek*[1,2]
[1]Department of Public Health, Brandenburg University of Technology Cottbus-Senftenberg, Senftenberg, Germany
[2]Lusatian Center for Digital Public Health, Brandenburg University of Technology Cottbus-Senftenberg, Senftenberg, Germany
[3]Social and Preventive Medicine, Faculty of Human Science, University of Potsdam, Potsdam, Germany
Contact: stephanie.hoffmann@b-tu.de

Background: Early childhood development (aged $<$6 years) is dependent on the social conditions in which children live and strongly affect their life course trajectory. This study describes changes in social inequalities in language development during the COVID-19 pandemic based on data from the legally prescribed school entry examination in the German federal state of Brandenburg. The aim is to inform public health interventions for individuals at risk of long-term health inequalities.

Methods: Secondary data from three cohorts of 5-7-year-olds were used [n = 19,2992018|19; n = 19,9162019|20; n = 19,6982020|21]. Language development was assessed as delayed compared to peers [LD yes/no], measured by public health services using validated instruments. Descriptive bivariate and multivariate analyses [OR, 95%CI] examined language delay [%] with social inequalities defined by (1) an index composed of parents' reported education and occupation [SEP low|high], (2) 'German native language' [yes-|no] and (3) 'years of kindergarten attendance' [$<4|\geq4$].

Results: Overall, the proportion of LD decreased over the years (21.1%2018|19; 19.2%2019|20; 18.8%2020|21), both among children from families with high SEP (14.3%2018|19; 13.0%2020|21) and from German-speaking families (20.2%2018|19; 17.8%2020|21). LD rates among children increased with low SEP (42.4%2018|19; 43.4%2020|21) and remained constant with a non-German native language (36.0%2018|19; 35.5%2020|21). The probability for LD differed only for SEP (2018|19: ORlow|high=4.4, 3.93-4.94; 2020|21: ORlow|high=5.12, 4.54-5.77) and for native language (2018|19: ORnon-German|German=2.22, 1.86-2.66; 2020|21: ORnon-German|German=2.54, 2.19-2.95).

Conclusions: Social inequalities in language development based on SEP and native language increased slightly during the pandemic compared to the pre-pandemic period. Research should examine the effects of the pandemic on early development as well as protective and risk factors on a longitudinal basis.

Key messages:

- Social inequality in early development increased in Germany during the COVID-19 pandemic.
- To reduce health inequality in the life course, longitudinal research should assess the impact of the pandemic on child development.

Abstract citation ID: ckae144.080
Socioeconomic inequalities in avoidable mortality: results from the Italian nationwide cohort

Alessio Petrelli

M Ventura[1], *A Petrelli*[1], *A Di Napoli*[1], *M Pappagallo*[2], *S Simeoni*[2], *L Frova*[2]
[1]Unit of Epidemiology, National Institute for Health, Migration and Poverty, Rome, Italy
[2]National Institute of Statistics, Rome, Italy
Contact: alessio.petrelli@inmp.it

Background: Inequalities in avoidable mortality have been well evaluated in many European countries. We aimed to assess the association between socioeconomic status and avoidable mortality in Italy.
Methods: The nationwide closed cohort of the 2011 Census of Population and Housing was followed up for 2012- 2019 mortality. Outcomes of preventable and of treatable mortality were evaluated among people aged 30-74. Exposures were education level and residence macro area (North-West, North-East, Center, South-Islands). Adjusted mortality rate ratios (MRRs) were estimated through multivariate quasi-Poisson regression models, by sex and group of causes, taking into account age at death and macro area of residence. Relative index of inequalities (RII) was estimated for preventable, treatable, and non-avoidable mortality and for some specific causes.
Results: The cohort consisted of 35,708,459 residents (48.8% men, 17.5% aged 65-74), 34% with a high school diploma, 33.5% living in the South-Islands; 1,127,760 deaths were observed, of which 65.2% for avoidable causes (40.4% preventable and 24.9% treatable). Inverse trends between education level and mortality were observed for all causes; comparing the least with the most educated groups, a strong association was observed for preventable (males MRR = 2.39; females MRR = 1.65) and for treatable causes of death (males MRR = 1.93; females MRR = 1.45). Highest RII were observed for HIV/AIDS and alcohol-related diseases (both sexes), drug-related diseases and tuberculosis (males), and diabetes mellitus, cardiovascular diseases, and renal failure (females). Higher risks of preventable and of treatable mortality were found for those living in the South-Islands.
Conclusions: We documented relevant socioeconomic inequalities in avoidable mortality in Italy, especially in the Southern regions. They represent a possible missed gain in health and suggest a reassessment of priorities and definition of health targets with the lens of equity.

Key messages:

- An inverse socioeconomic gradient in avoidable mortality was observed in Italy, both for preventable and for treatable mortality, with geographical heterogeneity.
- Greatest social disparities were found in mortality for causes strongly associated with risk behavior and for which it is possible to identify risk factors on which to intervene.

Abstract citation ID: ckae144.081
Are health inequalities decreasing in Sweden?

Karin Engström

K Engström[1], *S Fritzell*[1], *Ö Hemström*[1], *H Källberg*[1]
[1]The Public Health Agency of Sweden, Solna, Sweden
Contact: karin.engstrom@folkhalsomyndigheten.se

Background: The overarching national goal for the Swedish public health policy is to create societal conditions for good and equitable health for all and to eliminate avoidable inequalities within a generation (until 2048). To know whether we are heading towards the public health policy goal, a surveillance system which follows a combination of several inequality measures over time, is needed.
Methods: All-cause mortality in age 25-64 and life expectancy at age 30, in the total population of Sweden, were used as measures of health and followed 2006-2022. Education (low, middle, high) was used to measure socioeconomic position. Both absolute and relative, and both simple and complex measures were used to analyse inequalities in mortality: rate difference (RD), relative risk (RR), population attributable fraction (PAF) and population attributable number (PIN). Life expectancy was analysed as absolute and relative difference in remaining number of years.
Results: Life expectancy has increased and mortality in age 25-64 have decreased in the Swedish general population. Comparing those with low and high education, both absolute and relative inequalities have increased, e.g. differences in life expectancy increased to > 6 years among men and almost 7 years among women, and relative inequality in mortality in age 25-64 increased to > 3 times higher risk (RR 3.1; CI 3.0-3.3). Inequality, measured with regard to all groups in the population, showed no noticeable changes over time.
Conclusions: The results show that Sweden is facing a challenge in achieving the public health goal to eliminate avoidable inequalities by 2048, with regard to life expectancy and mortality in age 25-64. To use a combination of health inequality measures strengthens the surveillance system and gives a more nuanced picture of the development. It enables, in parallel with universal health improving efforts, focus on the groups with the poorest health, where efforts have the greatest effect.

Key messages:

- Sweden is facing a challenge in achieving the public health goal to eliminate avoidable inequalities by 2048, with regard to life expectancy and mortality in age 25–64.
- A more nuanced picture of inequalities is crucial to be able to parallel universal health-improving efforts with a focus on the groups with the poorest health, where efforts have the greatest effect.

Abstract citation ID: ckae144.082
Inequities in child health in Luxembourg

Till Seuring

T Seuring[1], *T Ducomble*[1], *F Berthet*[1]
[1]Observatoire National de la Santé, Strassen, Luxembourg
Contact: till.seuring@obs.etat.lu

Background: In Luxembourg, despite its economic prosperity, 28.6 % of children are estimated to be at the risk of poverty. Research has shown that growing up with socioeconomic disadvantage is associated with worse physical and mental health in childhood. We explore the association of socioeconomic status with health, health behaviours and access to healthcare in Luxembourg for children up to age twelve.
Methods: We used data from 2014 to 2022 for 11-12 year old children from the Health Behaviour in School-aged Children (HBSC) survey as well as social security data from Luxembourg for a similar time period and children 0 to 12 years old. To assess socioeconomic status, we used information on self-perceived household wealth for the HBSC results and stratified health and health behaviours by well-off, average, or less well-off households. For the social security data, we stratified access to care indicators by equivalized household income quintiles.
Results: We found that physical activity levels, nutritional quality and daily routines such as eating breakfast and brushing teeth are significantly lower in children from less affluent families. For example, 61% of 11-12-year-old children from well-off families reported eating breakfast every day, but only 41% of children from less well-off families. Only 23% of 11-12 year olds from less affluent families rated their health as excellent, compared to 52% of children from affluent families. There were similarly large differences for multiple health complaints, with 63% of children from less affluent families reporting this indicator for psychosomatic

problems, compared to 34% of children from affluent families. We did not find differences in the use of pre- and postnatal care visits.
Conclusions: Socioeconomic differences in child health, mental health and health behaviours are large, with children from poorer households being in worse physical and mental health and less likely to report positive health behaviours.

Key messages:

- Many children in Luxembourg face socioeconomic challenges that are adversely associated with health and health behaviours. The underlying reasons require further attention to improve child health.
- Children from poorer backgrounds are in significantly worse mental health than children from better off families in Luxembourg.

Research ethics implications in the development of personalised therapy for pediatric SIRS patients

Silviya Yankulovska

S Yankulovska[1], F Stolte[1], P Thiemicke[1], M Orzechowski[1], F Steger[1]
[1]Institute for History, Theory and Ethics of Medicine, Ulm University, Ulm, Germany
Contact: silviya.aleksandrova-yankulovska@uni-ulm.de

Background: Pediatric Systemic Inflammatory Response Syndrome (SIRS) presents diagnostic and therapeutic challenge that can be addressed through personalised therapy. Related ethical challenges are understudied. Our report aims at identification and analysis of research ethics implications within the bigger ERA PerMed funded project of development of tailored immunotherapy for paediatric SIRS patients (TIPS) coordinated by Prof. Catharina Schütz from Technic University Dresden.
Methods: A sample of 10 experts with different backgrounds was studied through semi-structured interviews. Systematic literature review grounded the interview questionnaire. The transcripts were subjected to thematic analysis by two independent researchers.
Results: Five classical research ethics issues were identified: respect for autonomy; informed consent; risk-benefits ratio; data protection; social justice. All experts favoured the empowerment of children ($N = 10$) and obtainment of informed consent rather than assent was seen as a common goal ($N = 5$). The emergency context of SIRS research impeded the informed consent. Despite favourable risk-benefits ratio, no direct benefits resulted to study participants. Data anonymisation though necessary ($N = 10$), hinders proper dealing with incidental findings. Social justice issues apparently accompanied research design in personalised medicine ($N = 2$) but should not extend to access to personalised therapy.
Conclusions: The classical framework of research ethics is challenged by the new fields of medical research. Traditional concepts, such as informed consent in minors, are subject to rethinking. Current ethical and legal guidelines fall short of proper practical instructions in the specific case of SIRS pediatric patients. Thus, ethical aspects of new technology development should always be studied in parallel to the biometrics within personalised medicine projects so as to the development of guidelines is more evidence-based than precautionary driven.

Key messages:

- Current ethical and legal guidelines fall short of proper practical instructions in the specific case of SIRS pediatric patients.
- Ethical aspects of new technology development should always be studied within personalised medicine projects so as to the development of guidelines is more evidence-based than precautionary driven.

Abstract citation ID: ckae144.084
Issues of social justice in the development of personalised therapy for paediatric SIRS patients

Silviya Yankulovska

S Yankulovska[1], P Thiemicke[1], F Stolte[1], M Orzechowski[1], F Steger[1]
[1]Institute for History, Theory and Ethics of Medicine, Ulm University, Ulm, Germany
Contact: silviya.aleksandrova-yankulovska@uni-ulm.de

Background: Systemic Inflammatory Response Syndrome (SIRS) is an often-emergent condition, which lacks specific diagnostic tools. Personalised therapy could fill this gap but as every new technology, it raises issues of social justice. Our report aims at identification and analysis of social justice implications within the bigger ERA PerMed funded project of development of tailored immunotherapy for paediatric SIRS patients (TIPS) coordinated by Prof. Catharina Schütz from Technic University Dresden.
Methods: Qualitative research methodology thought 10 semi-structured interviews. Systematic literature review grounded the interview questionnaire. Transcripts were subjected to thematic analysis by two independent researchers.
Results: Social justice was seen as equal chances of inclusion of different population groups in research. Socioeconomic differences were perceived as a challenge to ensure justice across various populations ($N = 7$). Two interviewees saw discrimination as inherent to precision medicine, which is focused on personalised treatment. Two experts viewed the exclusion of specific patients' groups as an unsolvable problem, that only advocates for the inclusion of as many patients as possible. On the opinion of six experts individual and ethnocultural factors may influence outcomes in personalised treatment, especially considering the small sample size and the diverse populations. One medical expert, on the contrary, perceived no significant challenges associated with the heterogeneity of patients. Whether socioeconomic injustices should be addressed by guidelines and how these correspond to the rights of the patient were further discussed.
Conclusions: The issues of social justice accompany research in personalised medicine, including SIRS. In general, there is sensitivity to this issue, but current guidelines are too vague. As with other ethical problems, so with social justice we seem to have a rethinking of the concept, that needs further study.

Key messages:

- In the context of SIRS personalised therapy research, there is a sensitivity to the issue of social justice, but no consensus how to ensure it.
- Issues of social justice are often boiled down to equal chances of inclusion in research and equal access to treatment. In the case of personalised therapy, there seems to be more to it.

2.E. Round table: Building climate resilient health systems in the EU

Abstract citation ID: ckae144.085

Organised by: Ecorys, EUPHA-PHPP, -ENV
Chair persons: Rana Orhan Pees (Netherlands), Lisbeth Hall (Netherlands)
Contact: rana.orhanpees@ecorys.com

Climate change is one of the biggest challenges for modern society. The health effects of climate change lead to negative impacts on European health systems, and conversely, European health systems contribute significantly to climate change. To overcome challenges posed by the climate crisis, European cooperation is essential. The interdependencies between climate change and public health and its broader impact underline the importance of resilience in European health systems, calling for concrete actions from both EU institutions and national governments. Additionally, the topic of resilient health systems currently ranks high on the European agenda, with the Belgian Presidency promoting health care strengthening as one of its six priorities. The European Commission will also continue its work on this issue for the next five years. The EU has already taken steps in this matter, such as the launch of the European Health Union and the adoption of the EU4Health Programme. However, in order to better prepare for climate resilient health systems, the EU must further develop in this regard. To explore this pressing issue, the round table discussion will focus on how EU actions in climate adaptation can synergistically contribute to the resilience of health systems. Resilience, often associated with adaptation, embodies the capacity to anticipate, withstand, and recover from shocks and stresses related to climate change. By delving into this question, the workshop seeks to uncover ways in which EU and Member State climate initiatives can reinforce health system resilience, thereby fostering a more adaptive and responsive health workforce and infrastructure. Featuring 4 panellists from Erasmus University Rotterdam, the Austrian National Public Health Institute, the Dutch Green Healthcare Alliance and the European Environment Agency, the round table will bring together diverse perspectives on this issue. The added value of the round table is laying out possible ways of how both the EU and Member States can contribute to enhancing the resilience of European health systems. After establishing the necessity for action, the round table discussion will focus on generating ideas to address climate change. Specifically, this discussion will cover examples of national policies, such as from the Netherlands, Austria, and other Member States. Also discussed will be the importance of monitoring and surveillance, and conducting a health and vulnerability assessment. This ensures better understanding of the relevant current and future health impacts, which will inform resilience measures. This will be followed by a discussion with the audience to formulate recommendations for improving the resilience of EU health systems for the next five years.

Key messages:

- Climate change challenges European health systems, emphasising the need for European cooperation in resilience efforts.
- Synergising climate adaptation with health system strengthening enhances EU’s capacity for resilience.

Speakers/Panelists:

Chiara Cadeddu
Erasmus University Rotterdam, Rotterdam, Netherlands
Aleksandra Kazmierczak

2.F. Scientific session: Challenges in healthcare architectures

Abstract citation ID: ckae144.086

Organised by: EUPHA-URB, -PMH, -ENV
Chair persons: Stefano Capolongo (EUPHA-URB), Jutta Lindert (EUPHA-PMH)
Contact: andrea.rebecchi@polimi.it

The Workshop titled “Challenges in healthcare architectures” - proposed and developed by the three EUPHA Section: Urban Public Health (URB), Public Mental Health (MEN) and Environmental Health (ENV) - is aimed to foster the dialogue between designers (architects and urban planners), Public Health experts (operators, professionals and epidemiologists), general/sanitary Directors of healthcare facilities and medical staff, to establish a multidisciplinary approach for understanding together how to create and manage the healthcare facilities of the future. According to the main Conference topic “Sailing the waves of European public health: exploring a sea of innovation”, the workshop mainly addresses both the “Health care services and systems” and the “Health workforce, practice and training” EPH24 conference topics. The Workshops purpose is to explore the concept for the hospital of the future, that should be resilient to changes and capable of protecting different users’ health and tackle the transforming social, economic, environmental and epidemiological needs of the context in which they are located. As in many other spheres and economic activities, the pandemic accelerated the processes of innovation and digitization that had somehow already been activated. The healthcare issue, the use of smart devices for a dialogue between the healthcare professionals and the pervasive use of apps to monitor certain health parameters, are just some of the megatrends that were being observed and which have now necessarily entered into everyday life. In the same way, the hospital, which in the face of this gradual process of dematerialization and relocation of ‘softer’ clinical-diagnostic activities, reaffirms itself as a center of the highest specialty for the treatment and care of acute patients, for high-level clinical and experimental re-search, for diagnostics and more complex operations. At the same time, and finally, the hospital is inserted in a territorial healthcare facilities network, that should be planned, designed, and managed. The workshop program includes inputs which they argue current experiences, emerging practices and scientific outcomes related to the hospital design, planning and management sphere, coming from four different European countries. From designing to managing practices, in “Hospital Design and planning in the line of Foresight of Health Needs” and in “Sustainability in the Next Generation Hospital”. From digitalization in national resilience experiences, in “Digital

Health Spaces in the City of Lisbon. The Role of Digitalization in linking Boundaryless Hospitals and Smart Health Cities" to novel approaches for specific disease, in "Building bridges: mobile mental health care units in four European countries".

Key messages:

- Explore the "hospital of the future" concept, resilient to changes, capable of protecting users' health, and to tackle the transforming social, economic, environmental and epidemiological needs.
- Establish a multidisciplinary and territorial approach, for understanding together how to create and manage the healthcare network of the future.

Abstract citation ID: ckae144.087
Hospital design and planning in the line of foresight of health needs

Marija Jevtic

The health needs of the population are increasingly difficult to plan and predict. Technological progress, artificial intelligence, new medicines, but also ecological disasters, humanitarian crises, energy crisis and other challenges (as a Covid 19 pandemic) represent the image of our time. New design of hospitals should be able to respond to the challenges of the future: comprehensive provision of health services taking into account the patient's needs, working conditions taking into account the hospital staff, energy efficiency and construction in accordance with high standards and reduction of CO2 emissions (green hospitals), to ensure alternative sources of electricity and water supply bearing in mind potential emergencies. The big challenge of long-term construction in which advanced technologies and new procedures cannot simply fit into a rigid building structure that is several decades old (example Serbia), so it is necessary to apply precise planning and efficient and high-quality construction in the next generation hospitals, taking into account current modern equipment and that which will appear in the future. Designing hospitals involves anticipating future healthcare challenges, technological advancements, demographic shifts, and changes in patient expectations. Hospitals emphasis on patient-centered design principles, creating environments that prioritize comfort, privacy, and dignity for patients and their families, accessibility and inclusivity, infection control and prevention, sustainability and resilience. Modern hospitals should create collaborative spaces for interdisciplinary teamwork and communication among healthcare providers, research and innovation units, but also community engagement and health promotion activities. Future hospital design requires strong multidisciplinary and cross-sectional cooperation, in which priority is given to architects dedicated to this field and their cooperation with public health and health management experts.

[1]Design&Health Lab., DABC Politecnico di Milano, Milan, Italy
Contact: andrea1.brambilla@polimi.it

Technological, demographic, epidemiological, environmental and social changes require investment in new sustainable hospital infrastructure; there is a lack of guidelines and interaction between Stakeholders. In February 2022, the Joint Research Platform Healthcare Infrastructures (JRP HI) was established consisting of Hospital Strategic Directions and Industrial Partners in Italy. Starting from the WHO Techincal Brief "Hospitals of the Future", a national survey was carried out via web-survey and semi-structured interviews with a sample of 30 stakeholders to collect the main drivers and constraints for innovation and the framework from a One Health perspective and in terms of sustainability. The main needs to be addressed through the guidelines refer to digitalization (27%), flexibility (32%), environmental sustainability (36%) and economic sustainability (27%) as well as flow management (18%) and hospital infection (14%). The participants consider SDG-3 'Good Health and Wellbeing' to be the most relevant for development activities. Hospital managers prioritize SDG-8 'Decent Work and Economic Growth' (23%); vice-versa the industrial partners suggest SDG-11 'Sustainable Cities and Communities' and SDG- 13 'Climate Actions' (32%) as topics to be addressed. Furthermore, 57% of the respondents state that they lack adequate training, budget or leadership to apply innovative strategies in the day-to-day management of the healthcare organization. The survey highlighted a lack of initiatives, budget, and standardization for enhancing environmental sustainability in healthcare infrastructures. The sustainability of building systems depends on factors such as energy consumption, alternative energy sources, thermal comfort, water usage, waste management, ventilation, lighting efficiency, air quality, and construction materials. Ensuring the adoption of monitoring systems and harmonized standards of performance measurement is crucial for increasing the environmental sustainability.

Digital transformation is reshaping every aspect of society, including healthcare. The concepts of 'Boundaryless Hospitals' (BH) and 'Smart Health Cities' (SHC) represent a forward-thinking approach to healthcare that leverages digital technologies to enhance service delivery, operational efficiency and patient outcomes, including healthy mobility. This session delves into the complex role of digitalization in creating interconnected health and spatial environments where the flow of data and resources across physical and virtual barriers is optimized. BH embody a healthcare model where digital tools, health information systems and AI-powered diagnostics are integrated to provide care that transcends traditional hospital walls into the city. This approach not only facilitates greater accessibility and flexibility in patient care but also enhances the capacity for healthcare providers to offer personalized and timely interventions, embracing public health altogether. SHC integrates health technology into urban planning and public health services to create ecosystems that actively contribute to the health and wellbeing of their populations. Using big data analytics, IoT and other digital infrastructures, these cities support sustainable health practices, disease prevention, and efficient crisis response, promoting an overall healthier populace. This session will explore how digital health spaces can bridge the gap between these concepts. Discussions will focus on public health challenges and opportunities, examining the case of the city of Lisbon on how digital platforms can facilitate interactions between healthcare providers, patients, and urban environments. Best practices from pioneering projects around the globe will be highlighted. Participants will engage in comprehensive analyses of Lisbon case that demonstrate successful integration of digital health technologies in various contexts, contributing to the resilience and adaptability of healthcare infrastructures.

Building bridges: mobile mental health care units in four European countries

Jutta Lindert

J Lindert[1]
[1]Department of Health and Social Work, University of Applied Sciences Emden, Emden, Germany
Contact: jutta.lindert@hs-emden-leer.de

Background: Individuals living in rural and remote areas may have limited access to mental healthcare due to lack of facilities, socioeconomic reasons, stigma and lack of mental health literacy. To meet the needs and provide needs-based care care mobile mental health care clinics were established in some countries in Europe, including in Belgium, Germany, Greece and in Moldowa. A mobile clinic is a customized motor vehicle that travels to communities to provide mental health care. The mobile clinics are an integral part of the health care system and help ensure access to mental care.
Aims: To describe mobile care clinics in two countries in Europe using a case study design.
Results: Mobile clinics deliver a wide variety of mental health services, are heterogeneous and consist of multidisciplinary teams, including physicians, social workers, and other health professionals. The organization and financing of the Mobile mental health clinics is different in the four countries (e.g. part of the mental health care system in Belgium, and Moldova, part of initiatives in Germany and Greece). Due to data protection no detailed data on patients can be provided at the moment. The structures on mental health care mobile clinics in the four countries will be described in detail in the talk.
Discussion: Mobile clinics often serve as a bridge between communities and the mental health care system. Another important issue in rural areas is the ongoing aging of the population. The number of Elderly patients is expected to rise in the future. The care of those patients is challenging for the mental health and the primary care system. There is a necessity for establishing bridges between mobile clinics and hospital care.

2.G. Practice session: Africa and Europe: peer-to-peer HIS assessments for NCD, mental health and injuries surveillance

Abstract citation ID: ckae144.091

Organised by: Robert Koch Institute (Germany), Africa Centres for Disease Control and Prevention, WHO/Europe
Chair persons: Angela Fehr (Germany), Marieke Verschuuren (EUPHA)
Contact: FehrA@rki.de

Public health surveillance is the basis for evidence-informed decision-making and health (systems) research, globally. Without robust data, public health challenges cannot be tackled. NCDs, mental health conditions and injuries (NCDI/MH) are among the biggest global public health challenges. Their risk and protective factors, including social, political and commercial determinants of health, transcend borders and require multi-disciplinary, multi-stakeholder and long-term responses. Since 2006, comparable national data on NCDI/MH are being collected in Europe on the basis of European Core Health Indicators (ECHI) and the European Health Interview Survey (EHIS). Currently, EU and WHO EURO are working together to set up a new Health Information Network. At EU level, a sustainable health information infrastructure is still lacking, despite extensive preparations in EU-funded projects. Part of these project activities were health information system (HIS) assessments, applying the WHO EURO Support tool to strengthen health information systems for peer-to-peer assessments. In the African region, the Africa Centres for Disease Control and Prevention (Africa CDC), founded in 2017, made NCDI/MH prevention and control a strategic priority. In 2021, it launched its first continental NCDs, Injuries Prevention and Control and Mental Health Promotion Strategy (2022-26) under which the organization supports its Member States. At the 3rd International Conference on Public Health in Africa (Zambia, Nov. 2023), Africa CDC presented a continental Guidance to strengthen NCDI/MH surveillance. The Guidance was developed in collaboration with Robert Koch Institute (RKI) and is based on desk reviews, surveys and national HIS assessments. Both Europe and Africa performed HIS assessments to strengthen NCDI/MH surveillance; standardized tools from WHO EURO and from the International Association of National Public Health Institutes (IANPHI) were used and adapted to fit peer-to-peer approaches and regional contexts. This workshop will present and discuss methodological approaches, experiences and lessons learned, thereby initiating knowledge exchange across continents. The presentations will address the following points:
- From top-down to peer-to-peer: methods & tools used in HIS assessments
- From paper to practice: the importance of site visits in HIS assessments
- From educated guesses to evidence: outcomes of HIS assessments at country level
- From evidence to action: translation of HIS assessment outcomes into HIS improvements
- From pilot to scale-up: challenges, lessons learned, sustainability of HIS developments

To our knowledge, this workshop is the first one at the EPH to bring together practitioners in HIS strengthening for NCDI/MH from Africa and Europe. The workshop offers a unique opportunity to engage with the audience and to explore options for international collaboration.
Key messages:
- Interregional collaboration helps reduce health information inequalities, facilitating better global management of high burden health challenges, such as NCDs, mental health conditions and injuries.
- Peer-to-peer HIS assessments in Africa and Europe strengthen NCDI/MH surveillance. They build evidence for policy advice, research and health education and add the benefit of forging expert networks.

Abstract citation ID: ckae144.092

The Africa CDC Guidance for Strengthening NCDI-MH Surveillance Systems: The role of HIS assessments

Adelard Kakunze

Deaths due to NCDs, injuries and mental health conditions are expected to at least triple by 2063 in the region of the African Union. Population-based data for NCDI/MH and their determinants remain scarce in many AU MS; therefore, NCDI/MH surveillance is a flagship initiative in the Africa CDC NCDI/MH Strategy. In a survey conducted by Africa CDC and RKI in 2022 on the impact of COVID-19 on NCDI/MH in 10 AU MS, countries signaled the need for a continental guidance document. In 2023, Africa CDC and RKI performed desk reviews and facilitated peer-to-peer multi-country HIS assessment workshops, based on modified WHO and IANPHI tools. The first workshop took place in Zambia with experts from Botswana, Democratic Republic of Congo/DRC, Kenya and Zambia. The second workshop was hosted in Ghana and included DRC, Ghana, Morocco, Nigeria, Senegal and Sierra Leone. Participants came i.a. from ministries of health, national public health institutes or academia. The process included a virtual introductory meeting as well as half-day training sessions at the physical meeting for participants to familiarize themselves with the tools. Peer-to-peer assessment sessions took place on days 2 and 3. Day 4 was reserved for site visits to (public) health institutions of the hosting countries. On day 5, participants presented their findings to the plenary, which included high-level representations from host countries. The combined results from the survey, desk reviews and workshops informed the development of the continental Africa CDC Guidance for strengthening surveillance for NCDI/MH, launched at the 3rd Conference on Public Health in Africa. In four chapters, the Guidance covers recommendations on indicators, data sources and data types; surveillance system capacities; surveillance integration with existing systems; and data use. Implementation of the Guidance, including development of core health indicators, has been initiated by Africa CDC in 2024.

Since the late 1990s, with the development of European Core Health Indicators (ECHI) and the European Health Interview Survey (EHIS), the EU aims to strengthen its continental database for evidence-informed public health policy and research. BRIDGE Health (2015-2017), InfAct (Information for Action 2018-2021) and PHIRI (Population Health Information Research Infrastructure 2020-2023) projects prepared for the establishment of a sustainable European health information infrastructure. Country health information system (HIS) assessments were core project activities, performed on the basis of the WHO Euro ‘Support Tool to strengthen health information systems’. To serve project objectives, the original top-down Support Tool was modified and implemented in a peer-to-peer approach among project countries. InfAct and PHIRI conducted 9 country peer-assessments each. InfAct assessments were carried out through country visits, targeting overall health information inequalities and good practices. PHIRI performed virtual country visits, focusing on COVID-19 health information flows. The WHO Tool was further adapted by the Joint Action TEHDAS (2021-2023) to assess the readiness of HIS in Europe for the European Health Data Space. Experience with these different iterations led to the revision of the Support Tool in 2021 to include a more expanded and modular approach which enables HIS assessments to opt to focus on specific aspects. To date, a sustainable European health information infrastructure has not been set up. Currently, the EU funds a joint Health Information Network with WHO Euro. Building regional infrastructures for public health and NCDI/MH monitoring and reporting depend on structures and on the political will of supranational organizations and their members. Meanwhile, HIS assessments to improve surveillance, population health and to reduce health information inequalities lend themselves to increased international collaboration and knowledge exchange.

2.H. Round table: Health system description and comparison: lessons from the WHO/Observatory Insights series

Abstract citation ID: ckae144.094

Organised by: WHO/Europe, European Observatory on Health Systems and Policies
Chair persons: Bernd Rechel (European Observatory), Natasha Azzopardi Muscat (WHO/Europe)
Contact: bernd.rechel@lshtm.ac.uk

The European Observatory on Health Systems and Policies has been working for more than 25 years on the systematic description, analysis and comparison of health systems in Europe. This workshop explores experiences so far with a new series of health system profiles, the Health Systems in Action (HSiA) Insights, launched in 2021 in collaboration with the WHO Regional Office for Europe. The first round of the Insights in 2021 was a pilot series, covering just five countries (Georgia, Kyrgyzstan, North Macedonia, Ukraine, and Uzbekistan). Since then, the series has grown to 13 countries in 2022 and in 2024 is covering almost all WHO Member States that are outside of the European Union (EU). The Insights aim to provide short and easily accessible documents that provide core information on a country’s health system, its key strengths and challenges, how it compares to other health systems in Europe, and how it impacts on the health of its population. This roundtable provides a platform for sharing experiences with devising, writing and using the series so far, bringing in country and comparative perspectives and involving the audience. The objectives of the roundtable are to a) identify best practices for the comparative description and analysis of health systems in the form of a series of country profiles; b) explore the challenges of drawing up country profiles where comparative data are lacking, incomplete or politicized; c) identify ways of disseminating and using country profiles; d) establish an opportunity for cross-country learning and skills development for the writing of health system descriptions and analyses. The roundtable will consist of four speakers. It will start with three very brief country presentations on the Insights for Israel, North Macedonia and Kazakhstan, followed by a brief comparative perspective on how to capture, compare and analyse health workforce trends across a broad set of countries, which is the Spotlight section of the 2024 round of Insights. This will be followed by a broad discussion with audience interventions to bring in the experience of other experts and countries. The moderated discussion will emphasise key learning points on how to devise a comparative series, how to write health system profiles and how best to use them to inform health policy-making.

Key messages:

- The regular monitoring of health systems and policies is challenging, but essential for improving them.
- Health system summaries require systematised approaches and up-to-date comparative data.

2.I. Scientific session: Addressing vaccine hesitancy: from understanding determinants to implementing targeted strategies

Abstract citation ID: ckae144.095

Organised by: School of Public Health University of Pavia (Italy), EUPHA-IDC, -DH
Chair persons: Anna Odone (EUPHA-DH -IDC), Roberta Siliquini (Italy)
Contact: gvigezzi@hotmail.com

Supported by NextGenerationEU (no. PE00000007) and EU4Health (VAXaction), the workshop will present a pan-European perspective on vaccine hesitancy and the effectiveness of counteracting interventions, especially when facing potentially pandemic infectious threats. Analysing human responses to epidemics is crucial to improve mathematical disease modelling and develop strategies to monitor behaviours during outbreaks, including assessing levels of vaccine hesitancy. This session will explore the multifaceted issue of vaccine hesitancy, which remains a significant barrier to achieving optimal vaccination coverage and is identified as one of the top threats to global health. By integrating theoretical frameworks with practical applications, the workshop aims to present a comprehensive overview of strategies employed to mitigate hesitancy across various demographics and regions. The first presentation will cover a thorough overview of the strategies employed to counteract vaccine hesitancy, leveraging existing infrastructure, health promotion policies, and educational initiatives. It will also explore the role of digital health tools and regulatory measures, such as health passes and nudging techniques, in enhancing vaccination uptake. Furthermore, the session will cover a systematic review of immunisation information systems (IISs) and the proposal of an innovative unvaccinated registry. This part of the workshop will delve into technological advancements and the integration of behavioural insights, which are essential for enhancing vaccine coverage and informing public health strategies. Another significant aspect of the discussion will be the evolution of vaccine mandates, from their historical roots to their contemporary applications. This discussion will reflect on policy shifts necessitated by emerging public health challenges and the need for adaptable strategies that can respond effectively to fluctuating vaccine coverage and acceptance rates. Panel discussions will feature notable experts such as Prof. Carlo Signorelli, President of the Italian NITAG, and Prof. Maria Ganczak, Vice President of the EUPHA Infectious Diseases Control section. These discussions will provide a comparative analysis of vaccination policies across different European countries, highlighting diverse approaches to mandates and the implementation of public health interventions aimed at combating vaccine hesitancy. By providing a unified approach to understanding and combating vaccine hesitancy, we aim to facilitate a critical exchange of ideas and strategies among experts in the field. It will serve as a dynamic platform for discussing evidence-based interventions tailored to specific population needs, enhancing public health outcomes across Europe. This engaging session promises to offer valuable insights into the complexities of vaccine hesitancy and the collaborative efforts required to address this global health challenge effectively.

Key messages:

- Enhanced data collection and analysis are essential to combat vaccine hesitancy, allowing for tailored interventions that address specific community needs and barriers to vaccination.
- Effective strategies against vaccine hesitancy require historical understanding and flexibility to adapt to new challenges, ensuring public health policies are responsive and culturally sensitive.

Abstract citation ID: ckae144.096

The EU project VAXaction: tacking effectively vaccine hesitancy in Europe

Flavia Pennisi

Contact: pennisi.flavia@hsr.it

The main objective of VAX-ACTION is to support EU Member States and relevant stakeholders to implement the results of tailored, evidence-based interventions aimed to reduce vaccine hesitancy. Based on the evaluation of effectiveness of these interventions, which will be conducted in selected target regions in EU member states, recommendations will be drawn through diverse dissemination strategies to allow scaling up good practices to other member States, but also to the USA and Canada, where gaps in implementation strategies also have prevented effective, evidence-based interventions aimed to better deal with vaccine hesitancy.

The first phase of the research involved some relevant systematic reviews with the aim of:

1. to map public health evidence and research results on large-scale vaccination programs in Europe and north America;
2. to map interventions aimed to address vaccine hesitancy regarding new and well-stablished vaccines and vaccination programs (Covid-19, mpox, national immunizations programs for children) in Europe and north America;
3. to identify successful and unsuccessful interventions designs aimed to address vaccine hesitancy, including challenges in the implementation, evaluation designs, and the feasibility of scaling-up solutions that are context-sensitive;
4. to identify significant similarities or dissimilarities in the designs and outcomes of interventions aimed to address vaccine hesitancy in northern countries where political and academic concern towards this phenomenon is growing;
5. to identify the extent to which ‘grounding’ (bottom-up) experiences aimed to address vaccine hesitancy are evidence-based, build on current international knowledge and guidelines, and whether they are internationally reported;
6. to systematize the mapping of interventions aimed to address vaccine hesitancy in the northern hemisphere in a way that can be shared and used by third parties.

This contribution will illustrate the results of the first phase of the project.

Through a systematic review of 253 studies, we identified significant advancements in IIS functionalities including real-time data access, interoperability, and life-course vaccination records, crucial for robust public health responses. Our review reveals that vaccinations are vital for public health and societal welfare; however, vaccine hesitancy is a significant barrier, driven by complex factors. Most IIS implementations predominantly utilise web-based platforms focused on children’s vaccinations with features that enhance data interoperability and public health surveillance. Despite these advancements, gaps in vaccine coverage and hesitancy mapping persist due to suboptimal data integration and system interoperability. Parallelly, we propose a comprehensive registry that includes unvaccinated individuals, aiming to address vaccine hesitancy by integrating demographic and socio-economic data. This initiative promises to enhance health equity by providing actionable insights into vaccination gaps and facilitating targeted interventions. Ethical considerations, particularly data privacy, are paramount, as well as adhering to regulations such as GDPR to ensure the protection of personal health information. The integration of IIS with a registry that includes unvaccinated populations represents a transformative approach to public health, potentially increasing vaccine coverage and effectively informing policy decisions. This dual strategy leverages not only technological advancements but also incorporates essential behavioural insights, offering a path forward in the ongoing battle against vaccine-preventable diseases. This model aligns with the Italian National Vaccination Prevention Plan and underscores proactive, evidence-based strategies to enhance vaccination uptake, serving as a cornerstone for broader application in other national contexts.

Luigi Sacco pioneered efforts in 19th-century Italian vaccination campaigns when mandatory vaccination practices began as a public health strategy. We bridge past and present through a systematic review of both historical and contemporary vaccine mandate policies. While Sacco’s early initiatives, characterised by compulsory vaccination and effective communication strategies, set foundational principles for vaccine mandates, the modern era, especially during the COVID-19 pandemic, has seen a significant shift in the nature and application of vaccine mandates. Recent legislative changes across various countries have introduced stricter mandates aimed at managing public health crises. For instance, Italy and France, deeply impacted by reduced vaccine uptake and subsequent measles outbreaks, responded by reinforcing vaccine mandates. These countries aimed to mitigate the dual challenges of achieving high vaccination coverage and combating growing vaccine hesitancy. Comparative analysis of recent legislative changes reveals a trend towards increasing coerciveness in vaccine mandates, reflecting a blend of functional and political pressures driving government decisions. This trend is evident in the legislative adjustments made in California, Australia, France, and Italy, where heightened penalties and reduced exemptions were introduced to counteract declining public compliance. The synthesis of these experiences highlights the critical role of robust, credible communication and the nuanced application of mandates that consider societal and cultural contexts. Contemporary strategies are characterised by targeted interventions aimed at specific populations, reflecting the complex interplay of social, political, and health dynamics in vaccine policy. The enduring relevance of vaccine mandates underscores the necessity of flexible, responsive public health strategies that effectively address both long-standing and emergent vaccine hesitancy and coverage challenges.

2.K. Scientific session: Promoting organizational health literacy in healthcare organizations and beyond in Europe

Abstract citation ID: ckae144.099

Organised by: Austrian National Public Health Institute (Austria), Aarhus University (Denmark), Steno Diabetes Center Sjaelland (Denmark), EUPHA-HL, -HCW, WHO/Europe
Chair persons: Diane Levin-Zamir (Israel), Christa Straßmayr (Austria)
Contact: christa.strassmayr@goeg.at

Organizational health literacy (OHL) has been defined as the degree to which healthcare organizations equitably enable/empower people, through organizational structures, policies, and processes, to find, understand, appraise, and use information and services to make health-related decisions and actions for themselves and others. By adopting an OHL approach, healthcare organizations enhance health service delivery by simplifying interaction with health systems by making information and services more comprehensible. An OHL approach not only reduces health literacy demands of patients, but also of workforce and the resident population of the community that they serve. The workshop focuses on two theory-based initiatives that focus at promoting OHL in Europe: (1) the Organizational Health Literacy for All (OHL-ALL) initiative, which developed a practice-oriented OHL approach for organizations promoting equity explicitly to support people in vulnerable positions with or at risk for diabetes or other non-communicable diseases, and (2) the World Health Organization (WHO) Action Network on Measuring Population and Organizational Health Literacy (M-POHL) which aims at initiating and facilitating the (self-) assessment of OHL in healthcare organization by developing, providing, and disseminating OHL assessment tools. Both initiatives strive to support organizational change and workforce responsiveness. While the first initiative goes beyond health literacy responsiveness of healthcare organizations intending to offer guidance for organizations on how to give all individuals the best possible opportunities to achieve their optimal health and well-being, the second initiative specifically focuses on OHL in healthcare organizations using a settings approach with a focus on health care, prevention, and health promotion. The initiatives enrich and complement each other. The workshop consists of five short presentations, followed by a discussion among the presenters and the audience. The first presentation focuses on the development of the theory-informed and coherent OHL approach of the OHL-ALL initiative. The second presentation provides an overview of the M-POHL initiative and its innovative tools. Then three presentations will showcase results, experiences, and outcomes from European countries on assessing OHL in different healthcare settings. Expected impact: Theory-based guidance for implementing organizational development will be provided. Results from the M-POHL initiative will contribute to greatly needed insights into OHL needs and opportunities of healthcare organizations. The insights from these real-world assessments and implementation can inform future public health practice, policy, and research.

Key messages:

- An OHL approach contributes to better equity. It helps meet health literacy needs of patients, health and care workforce and the resident population of the community that are served.
- New tools have been developed to support management and health and care workforce in assessing and improving OHL responsiveness, to better serve patient communities.

Abstract citation ID: ckae144.100

OHL-ALL: a theory-informed and practice-orientated organizational health literacy equity approach

Peter Bindslev Iversen

P Bindslev Iversen[1], *H Terkildsen Maindal*[2]
[1]OHL-ALL, SDCS and DPH-AU, Steno Diabetes Center Sjaelland, Holbaek, Denmark
[2]Department of Public Health, Aarhus University, Aarhus, Denmark
Contact: peiv@regionsjaelland.dk

Background: The OHL-ALL initiative was launched by Steno Diabetes Center Sjaelland and the Department of Public Health, Aarhus University and the OHL-ALL scientific group in cooperation with EUPHA-HL and M-POHL in November 2023. The OHL-ALL (Organizational Health Literacy for All) approach offers an opportunity to rethink and develop organizational health literacy (OHL) with an explicit normative basis for equity. The goal is to establish a theory-informed, practice-oriented, multifaceted, and implementable approach. In the OHL-ALL approach, we define equity as the normative anchor, and we suggest using the Capabilities Approach to embed improved equity in design, implementation, and evaluation of interventions.

Methods: The process of developing the OHL-ALL was guided by applying core ideas from Amartya Sen's Capability Approach. Five intervention principles were derived from the existing organizational health literacy literature: organizational change, workforce responsiveness, user involvement and person-centered care, access and navigation and internal and external partnerships. After an international expert working group meeting in November 2023, we formed four work packages.

Results: At the EPH conference, a status of the progress in the four work packages will be presented:

WP1. OHL-ALL Framework development based on capability, fairness, and equity.

WP2. Initiatives and testing of the OHL-ALL framework.

WP3. Evaluation of OHL-ALL (i) the capability approach and (ii) outcome domains.

WP4. Plans for the future, including advocacy and outreach - ideally via a conference in 2026.

Conclusions: The OHL-ALL project presents a novel approach to advancing equity in health by improving users' capabilities. Based on an explicit normative framework it is expected to offer theoretical and practical guidance for organizations that chose to implement a health literacy approach.

Abstract citation ID: ckae144.101

Organizational health literacy in hospitals and primary health care - developing innovative tools

Hanne Søberg Finbråten

H Finbråten[1], *D Levin-Zamir*[2,3,4], *C Straßmayr*[5]
[1]Department of Health and Nursing Sciences, Inland Norway University of Applied Sciences, Elverum, Norway
[2]Department of Health Education and Promotion, Clalit Health Services, Tel Aviv, Israel
[3]School of Public Health, University of Haifa, Haifa, Israel
[4]School of Public Health, Tel Aviv, Israel
[5]International Coordination Center of M-POHL, Austrian National Public Health Center, Vienna, Austria
Contact: hanne.finbraten@inn.no

Background: Organizational health literacy (OHL), particularly in health systems, is vital for supporting public health. Self-assessment tools (SAT), critical for quality assessment/improvement and for empowering relevant stakeholders, could support hospitals and primary healthcare services to promote their role in health literacy responsiveness, and support organizations in identifying strengths and areas of improvement.

Methods: The SAT for OHL in hospitals (OHL-Hos) and in primary healthcare (OHL-PHC) were developed via a participatory process, based on the "Vienna Concept of a Health Literate Healthcare Organization". Piloting of the tools in European countries shed light on the tools' depth and the need for revision. The development of short versions followed a Delphi process with experts from ten to thirteen European countries, respectively, from December 2023 - April 2024. Healthcare service diversity within and between countries was taken into consideration as well as cultural/language adaptation. Shortening OHL-Hos followed four steps: 1) prioritization of the most relevant indicators, 2) considering additional resources, 3) consensus process, 4) refinement of the tool and wording.

Results: The SATs for both healthcare settings are now established. The SAT for OHL-Hos includes a matrix model of eight standards, 21 sub-standards and 75 indicators. The SAT for OHL-PHC includes seven standards, 19 sub-standards and 69 indicators, covering OHL in organizational structures and processes for staff, patients and the community served with specific focus on navigation, communication, and participation. Both SATs are accompanied by a guide to direct organizations through in the self-assessment process.

Conclusions: The process of identifying OHL needs and opportunities in the health system, facilitated by participatory methods for tool development, led to innovative SATs for OHL which are currently ready for piloting and implementation in European countries.

Abstract citation ID: ckae144.102
Organizational health literacy strength and learning opportunities in Italian hospitals

Chiara Lorini

C Lorini[1]*, G Bonaccorsi*[1]*, L Capecchi*[2]*, C Biagi*[1]*, P Zanobini*[1]*, B Unim*[3]*, C Lombardo*[3]*, MG Cacciuttolo*[4]*, A Paladini*[4]*, L Palmieri*[3]
[1]Department of Health Science, University of Florence, Florence, Italy
[2]Central Tuscany Local Health Unit, Pistoia Hospital, Pistoia, Italy
[3]Department of Cardiovascular, Endocrine-Metabolic and Ageing-Associated Diseases, ISS, Rome, Italy
[4]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
Contact: chiara.lorini@unifi.it

Background: Organizational Health Literacy (OHL) implies responsiveness and friendliness of healthcare organizations. In the context of the WHO Action Network M-POHL, Italy evaluated OHL in a hospital as a pilot.

Methods: The international self-assessment tool OHL-Hos explores 8 standards using 141 items. It was firstly translated and culturally adapted to Italy, and then tested to assess OHL in the public general hospital of Pistoia (Central Italy). A physician, 6 staff members of the healthcare management unit, and 3 medical residents in public health from the Florence University were involved in the pilot. The Pistoia hospital has 1,300 employees (44% nurses, 24% physicians) to face 18,000 hospitalizations per year.

Results: Completing the questionnaire took more than 5 hours. A comprehensive agreement was reached, even though different approaches aiming at improving HL in healthcare and non-healthcare staff emerged. Scores resulted acceptable/good for standard 5 (communication with patients) and 7 (promoting staff HL with regard to occupational risks and personal lifestyles), low for standards 1 (implementing OHL overall the hospital), 2 (involving stakeholders in developing documents, materials, services), 3 (staff training for personal and organizational HL) and 8 (contributing to local population personal HL improvement), which would apply more peculiar for other settings than hospitals.

Conclusions: The participation of the hospital working group in the assessment using the OHL-Hos raised interest toward this matter. It results time consuming for its excessive length, and some standards do not fit to the Italian hospital context, resulting more useful to assess the territorial organization. Reduction of the number of items and revision/reformulation of some of them are suggested. Nonetheless, the tool proved to be useful in indicating the most critical areas needing ad hoc interventions, such as training all the hospital staff.

Abstract citation ID: ckae144.103
An action plan to improve organizational health literacy in hospitals in the Czech Republic

Alena Šteflová

A Šteflová[1]*, J Dudra*[2]*, P Struk*[1]*, H Homolacova*[2]*, H Kopalova*[2]*, L Ripa*[2]*, Z Kucera*[1]
[1]National Institute for Health Literacy, Prague, Czechia
[2]Klaudian Regional Hospital, Mlada Boleslav, Czechia
Contact: alena@steflova.cz

Background: The National Institute for Health Literacy conducted in 2023 as part of the M-POHL network and in close collaboration with the team of the Klaudian Hospital a survey on the level of organizational health literacy using the OHL-Hos tool. The OHL-Hos tool was proven by the project implementation team as suitable for initiating and monitoring organizational change.

Methods: Based on the self-assessment and the results of the consensus workshop, the project implementation team identified development priorities that were submitted and approved by the hospital management. To keep the sustainability of the implementation, the hospital management decided to formulate an action plan, with the time horizon 2025.

Results: The proposed action plan, approved by hospital management, focuses on feasible measures within a given time horizon. For each development goal, responsible teams, time frames, and expected results were formulated. The implementation project team evaluated as the most innovative standard the standard dealing with internal communication with patients and their family after discharge and thus to ensure the continuity in supporting personal health literacy of patients and relatives. In addition, as further important standards, easy navigation and access to documents, materials, and services for patients and healthcare professionals were recognized. Interventions focusing on public education, especially for children and students of all school levels, have been proposed to enhance external communication and increase health knowledge in the region.

Conclusions: The process of regular OHL assessment of set up measures has been considered as a way how to ensure the long-term fulfilment of the newly adopted action plan by the hospital.

Organizational health literacy responsiveness in community pharmacies in Serbia

Dušanka Krajnović

D Krajnović[1]*, I Stević*[1]*, K Nikolić*[1]*, J Čavrak*[1]*, A Grahovac*[1]*, A Milošević Georgiev*[1]
[1]Faculty of Pharmacy, University of Belgrade, Belgrade, Serbia
Contact: dusica.krajnovic@pharmacy.bg.ac.rs

Background: The Faculty of Pharmacy at the University of Belgrade conducted a pilot study at community pharmacies in Serbia in 2023 in the framework of the M-POHL organizational health literacy (OHL) project. Community pharmacies in Serbia are considered relevant settings where people's health can be promoted within the organization.

Methods: The validated and culturally adopted Serbian version of the International Self-Assessment Tool for Organizational Health Literacy in Primary Health Care Services (OHL-PHC) was used. We recruited employees from 3 pharmacy chains with pharmacists from different units. A preparatory workshop was organized to explain the procedure and the concept of OHL. First, the self-assessment was performed in a small group of 5 persons individually, and then the results were discussed in a joint assessment. The self-assessment was based on the degree of fulfillment of 4 categories offered for each indicator: not fulfilled (0-25%), predominantly not fulfilled (26-50%), predominantly fulfilled (51-75%), and completely fulfilled (76-100%). The same scale was applied for the indicators, sub-standards and standards and the final score was the mean of the individual scores (min. 0, max. 4).

Results: The overall score of the OHL on the sample level was 1.93± 0.86, with the highest score for providing of easy access to primary care service and facilitating navigation (2.3±0.5). The least fulfilled standards were related to promotion of digital health literacy and promoting health literacy with the same score values of 1.7±1.0. Out of 69 indicators 1 had been self-assessed as not fulfilled and 15 reached low consensus ($SD \leq 1$), and needed to be discussed further.

Conclusions: Improvements in OHL in the piloted institutions are necessary for successful healthcare and health promotion and could be tailed in further usage of the OHL-PHC on a broader scope. More pilot studies are needed in other healthcare settings at primary level in Serbia.

2.L. Round table: Monitoring health reforms to inform policy innovation: the Health Systems and Policies Monitor

Abstract citation ID: ckae144.105

Organised by: Technische Universität Berlin (Germany), European Observatory on Health Systems and Policies
Chair persons: Katherine Polin (Germany), Ewout Van Ginneken (Germany)
Contact: katherine.polin@gmail.com

Background: The European Observatory on Health Systems and Policies' (Observatory) Health Systems and Policy Monitor (HSPM) network convenes an international group of around 50 national health systems researchers from over 40 institutions across 31 high-income countries, including all EU countries, Canada, Israel, the UK and the US. In advance of the HSPM annual meeting, experts share the current year's "top-three" health reforms in their countries via a standardized survey, soliciting details on content and general implementation processes. Reforms are iteratively organized into to 2 of 11 clusters, derived from the WHO health system building blocks. Experts then discuss background, status and content of national reforms in the year's main clusters and initiate cross-country collaborations. A repository of over 650 reforms since 2018 has been created and is available online, showcasing reform patterns in HSPM countries. The collected data have informed studies on reform trends in HSPM countries from 2018-2019 and between 2020-2022, with work ongoing. Data are also consulted by researchers and policymakers wishing to learn about and from reforms in other countries.

This workshop specifically aims to:

- Inform participants about the methodologies used by the HSPM network to track reforms
- Highlight common trends in major health reforms across countries since 2018
- Discuss national health reforms and the value of understanding and tracking these across countries
- Identify research gaps in reform monitoring relevant to policy makers
- Discuss how the health system research community can generate more relevant and actionable evidence

Added-value: The comparative analysis of reform trends provides insights into how systems operate and the types of reforms more likely to be implemented. The sharing of these insights also serves as a source of inspiration, allowing countries to learn from each other's successes and failures and adopt proven best practices. This is relevant for policymakers and researchers striving to support health systems strengthening. Therefore, the workshop will support knowledge exchange between researchers and policymakers by (1) informing researchers and policymakers about similar ongoing reforms in other countries and (2) identifying areas where researchers can contribute to country reform agendas, and (3) stimulating interest in cross-country collaborative research on similar and topical reforms in different countries.

Format: This is a roundtable workshop chaired and moderated by the Observatory. An overview of reform trends and patterns since 2018 will set the scene, followed by an interactive discussion with policymakers and HSPM network members to (1) delve into trend dynamics and implications for health policy and research and (2) identify major (missing) research areas relevant to policymakers. In addition, we will leverage the geographic scope and expertise of the audience to reflect on the value of monitoring reforms.

Key messages:

- Cross-country exchange of information on reform trends and implementation patterns can inspire future reforms and help policymakers identify promising policy approaches abroad.
- Knowledge exchange between researchers and policymakers helps to determine evidence gaps and to generate relevant and actionable evidence that can drive policy innovation.

Speakers/Panelists:

Reinhard Busse
Berlin University of Technology, Berlin, Germany
Ines Fronteira
National School of Public Health - NOVA University of Lisbon, Lisbon, Portugal
Iwona Kowalska-Bobko

2.M. Scientific session: Economics of Mental Health in the interplay between health systems and public health

Abstract citation ID: ckae144.106

Organised by: EUPHA-ECO
Chair persons: João Vasco Santos (EUPHA-ECO), Vanessa Gorasso (EUPHA-ECO)
Contact: jvasco.santos@gmail.com

Mental health systems and services are essential components of the public health infrastructure, serving as frontline for prevention and intervention for health overall. Despite this, access to mental health services remains largely inadequate, with the OECD calculating that only about one in three people with mental health problems has access to quality treatment across 19 EU Member States. The economics of mental health play an important role in determining the allocation of resources, the accessibility of services and the overall effectiveness of interventions. Effective planning requires an understanding of population needs, service gaps and utilization patterns, in order to ensure equity and health improvement. In fact, the conceptualisation of the economic dimensions of mental health enables policymakers, practitioners, and stakeholders to make informed decisions that optimize resource utilization and maximize societal benefits. The proposed workshop will build on previous activities of the EUPHA Section on Public Health Economics at EPH, including the recent establishment of a working group on the economics of mental health. The aim of the meeting is to promote the adoption of best practices and methodologies in the conduct of economic studies on mental health. As such, the workshop will provide an opportunity to discuss the unique challenges of economic evaluation in this field and to present relevant ongoing activities by members of the Section and other invited experts.

Key messages:

- Mental health, its distribution and at-risk populations influence resource allocation and policy decisions within mental health systems.
- Tackling inequalities in mental health is essential for promoting health equity and social justice, requiring evidence-based interventions and policy initiatives to empower marginalized communities.

Abstract citation ID: ckae144.107
The economics of mental ill-health in the EU/EEA

Michele Cecchini
Head of Public Health, EECD, Paris, France
Contact: michele.cecchini@oecd.org

This presentation will provide an overview of the challenges and costs of mental ill health in 29 EU/EEA countries and an economic assessment of options to address current policy gaps. Nearly 20% of people in the EU/EEA experience mental ill health, with a particularly high prevalence among vulnerable groups such as people on low incomes or young people. However, in the majority of cases, and particularly for those with milder forms, these conditions go undiagnosed. Even when diagnosed, access to quality health services is sub-optimal, mainly due to financial issues or waiting times. The European Union and its Member States have identified mental ill health as a major public health threat, but there are still significant policy gaps and a lack of evidence on the most effective and cost-effective interventions to implementation. Building on its methodology for identifying and evaluating better public health policies for better lives, the OECD has recently extended the scope of its economic work to mental health. This presentation will start by providing an estimate of the health and economic burden of mental ill health in EU/EEA countries and will present evaluations of best practices in this field recently introduced by EU Member States. The talk will not only present the results of the analyses but will also use the identified case studies to discuss the approach used and some of the methodological issues involved in carrying out economic analysis for a set of diseases with high burden but relatively low mortality.

Abstract citation ID: ckae144.108
Estimating the economic burden of mental and substance use disorders in Belgium

Masja Schmidt
Sciensano, Brussels, Belgium
Contact: masja.schmidt@sciensano.be

Mental and substance use disorders are the leading cause of disease burden (disability-adjusted life years, DALYs) in Belgium. Strong mental health policies are needed to reduce the burden, taking into account effectiveness and cost-effectiveness of possible interventions. Next to providing an overview of the economic burden of mental health conditions (what is), routine cost-of-illness studies also serve as a source of information for modelling the cost-effectiveness of policies and interventions to improve the mental health of populations (what could be). In the context of an extension of the Belgian Health Status Report and the Belgian National Burden of Disease Study, we calculated the direct medical costs of a range of health conditions, including mental health conditions such as depression. We used self-reported diagnostic data from the Belgian health Interview Survey linked with claims data to calculate the incremental costs attributable to mental health disorders with g-computation. We correct for confounders such as age and sex, and also look at uncertainty brought about by the data source and modelling. This presentation aims to share the experience of calculating the economic burden of mental ill-health in the context of a routine cost-of-illness study. We will present the results of the study and discuss alternative ways in which the costs of common mental health conditions such as depression could be estimated, for example based entirely on claims data using pharmaceutical cost groups.

Abstract citation ID: ckae144.109
Social Inequalities in mental health service use and perceived helpfulness: A global analysis across 111 countries

Christoph Henking
Department of Social Policy and Intervention, University of Oxford, Oxford, UK
Contact: c.henking@gmx.net

Social inequalities in mental health are evident in the prevalence of mental health problems, but also the utilisation and patents' perceived benefits of treatment. However, the extent of these disparities on a global scale and whether there are country-level differences in the predictors of mental health service use remain unknown. This study uses data from the Wellcome Global Monitor 2020, a nationally representative survey encompassing 111 countries and 117,088 individuals. We examine the association of socio-economic factors (such as household income and education), psycho-social factors (including stigma perception and trust in health professionals), and country-level variables (such as GDP, Gini coefficient, and health expenditure) with mental health service use and perceived effectiveness of treatment. Multi-level logistic regression models were employed for analysis. The utilisation of mental health professions of people with depression or anxiety symptomology is higher in HICs (predicted probability of 62% CI[0.60 - 0.65]) compared to LIMCs (predicted probability of 33% CI[0.31 - 0.34]). Higher country GDP (OR = 1.26 CI[1.08-1.47]) and health expenditure (OR = 1.11 CI[1.04-1.19] per percentage of health expenditure) are associated with higher treatment utilisation. On the individual level, those in the wealthiest quintile are more likely to engage with mental health professionals (OR = 1.25[1.14-1.36]) and perceive this treatment as highly beneficial (OR = 1.23[1.07-1.40]). Trust in healthcare practitioners and perceived stigma are also associated with mental healthcare use. This analysis shows strong patterns of mental healthcare use and perceived benefits depending on the wealth of the country, health expenditure and individual socio-economic status. Moreover, disparities in treatment utilization and effectiveness are also influenced by trust in healthcare professionals and perceived mental health stigma.

Can a Universal Mindfulness Programme Improve Well-Being in Adolescents?

Jemina Qvick

J Qvick[1,2]*, M Hintsanen*[2]*, T Vahlberg*[3]*, S-M Volanen*[1,4]
[1]Public Health, Folkhälsan Research Center, Helsinki, Finland
[2]Faculty of Education and Psychology, University of Oulu, Oulu, Finland
[3]Department of Biostatistics, University of Turku, Turku, Finland
[4]Department of Public Health, University of Helsinki, Helsinki, Finland
Contact: jemina.qvick@oulu.fi

Background: Approx. 14% of adolescents experience mental health disorders. Mindfulness-based interventions (MBIs) could be one way to support adolescents' well-being. We investigated the effectiveness of a 9-week school-based mindfulness intervention on adolescents' well-being, moderated by gender, grade, and independent practice.

Methods: In total 3519 Finnish adolescents (aged 12 - 15) from 56 schools were randomized into intervention, active (relaxation), and inactive (normal school curriculum) control groups. Well-being was assessed with two life satisfaction measures (Life Satisfaction [OECD] and The Satisfaction with Life Scale-Child [SWLS-C]) and positive and negative affects (Positive and negative affects [PANAS]) at baseline, at 9 weeks and 26 weeks and analyzed using multilevel linear modeling.

Results: Significant improvement in life satisfaction (SWLS-C) was found at 9 weeks in the MBI group ($\beta = 0.38$, 95 % CI 0.08-0.68, $p = 0.009$) compared to the active control. Furthermore, MBI demonstrated an increase in life satisfaction (OECD) among boys ($\beta = 0.25$, 95 % CI 0.04-0.46, $p = 0.016$) and 6th graders ($\beta = 0.26$, 95 % CI 0.04-0.49, $p = 0.015$) at 9 weeks compared to the active control. Additionally, MBI participants engaging in independent practice at least once a week had a higher increase in positive affect at week 26 compared to both the active ($\beta = 3.01$, 95 % CI 0.55-5.47, $p = 0.009$) and inactive control groups ($\beta = 2.81$, 95 % CI 0.23-5.40, $p = 0.026$). Those practicing MBI almost daily also demonstrated a higher increase in positive affect at week 26 compared to the active control group ($\beta = 2.95$, 95 % CI 0.28-5.62, $p = 0.023$).

Conclusions: MBI in the school context seems to have the potential to increase the well-being of adolescents, especially those who commit to regular independent mindfulness practice. Gender and grade may moderate the effects of MBI. Therefore, we need to better understand how gender and age influence the effectiveness of MBI.

Key messages:

- The findings indicate the need to further examine potential mediators and moderators that may influence the effectiveness of MBI on adolescents.
- According to this study, regular mindfulness practice in schools appears to be a promising way to improve well-being of adolescents.

Abstract citation ID: ckae144.111

Predictors of high blood pressure in children from 6 to 11 years: The PREDI cohort study

Marco Mastroeni

M Mastroeni[1,2]*, A Moletta*[1]*, C Corrêa*[1]*, S Mastroeni*[1,2]
[1]Postgraduate Program in Health and Environment, University of Joinville Region, Joinville, Brazil
[2]Nutrition Course, University of Joinville Region, Joinville, Brazil
Contact: marco.mastroeni@univille.br

Background: Hypertension is an important cardiovascular disease (CVD) in Brazil that affects approximately 30% of the adult population and accounts for nearly 50% of CVD-related deaths in the country. Identifying the main predictors of high blood pressure (BP) during childhood will help prevent the development of other CVDs in adulthood and deaths. This study aimed to estimate the effect of biological, demographic, and socioeconomic characteristics on the child's BP at 6, 9 and 11 years of age.

Methods: Cohort study conducted with 181 children in Joinville city, southeastern Brazil. Individual data were collected during three follow-ups (2016, 2021, and 2023) in a private room of the family's home. BP was measured by the auscultatory method. Poisson regression analysis adjusted for important covariates was used to estimate the relative risk (RR) of maternal and child weight status, demographic, and socioeconomic characteristics on the child's BP at ages 6, 9 and 11.

Results: The prevalence of high BP in children at ages 6, 9 and 11 was 26.5%, 20.4% and 3.0%, respectively. Pre-pregnancy body mass index (BMI) and the child's BMI were associated with high BP over the period investigated. The risk of children having high diastolic BP from 6 to 11 years of age was 6% higher (RR = 1.06; 95%CI 1.01, 1.11) when mothers had pre-pregnancy BMI ≥ 25 kg/m2, even after adjusting for child BMI. For each one kg/m2 increase in child BMI, the risk of children having high systolic BP pressure increased by 14% (RR = 1.14; 95%CI 1.05, 1.23), even after adjusting for pre-pregnancy BMI.

Conclusions: Pre-pregnancy excess body weight and increased child BMI were associated with high BP in children from 6 to 11 years of age. Addressing pre-pregnancy excess body weight and overweight in childhood, combined with BP monitoring from the age of six, are actions that can prevent the development of CVDs in adulthood, thus reducing a serious global public health problem.

Key messages:

- Encouraging parents to monitor their children's BP is essential to prevent associated chronic diseases throughout life.
- Identifying children with altered blood pressure is an important public health indicator.

Abstract citation ID: ckae144.112

How does family support mitigate the impact of childhood adversity on adolescent mental health?

Nicholas Kofi Adjei

[7]Department of Women and Children's Health, King's College London, London, UK
Contact: n.adjei@liverpool.ac.uk

Background: Childhood adversity is associated with increased risk of developing mental health problems over the life course. We investigated how family emotional support in adolescence may mitigate the impact of childhood adversity on adolescent mental health.

Methods: We used longitudinal data from the UK Millennium Cohort Study on 9,269 children followed to age 17 years. Individuals were assigned to exposure trajectories characterised using group-based trajectory models that included measures of poverty and family adversities (parental mental ill health, parental alcohol misuse and domestic violence) up to age 14 years. Using counterfactual causal mediation analysis and four-way decomposition modelling approach, we evaluated how perceived family emotional support at age 14 (measured using the three-item Short Social Provisions Scale) influences the association of childhood adversity trajectories on mental health at ages 14 and 17, assessing the relative contributions of mediation and interaction simultaneously.

Results: Compared with children experiencing low adversity and poverty, those exposed to childhood adversity were almost three times more likely to experience poor mental health (RR 2·99, 95% CI 2 ·41 to 3·57) at age 14 and age 17 (RR 2·58, 95% CI 2·09 to 3·06). Perceived emotional support mitigates up to 18% (95% CI: 9% to 26%) of this effect at age 14, and 13% (95% CI: 5% to 22%) at age 17, mainly due to interactive mechanisms.

Conclusions: Childhood adversity has a strong effect on mental health, which is partially mitigated by perceived family support in adolescence. Policies that support positive family functioning may be particularly beneficial for children who have experienced adversity.

Key messages:

- Socio-economic – associated mental health problems in adolescence differed based on levels of family support.
- Approximately 20% of the social inequality in mental health outcomes in adolescence may be mitigated or reduced by improving levels of family support.

Abstract citation ID: ckae144.113

Land of Shadow: Perceived maternal self-efficacy

Elena Capitani

E Capitani[1], G Prosperi[2], L Alaimo[2], N Nante[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Degree Course in Obstetrics, University of Siena, Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: ecapitani89@gmail.com

Background: In our society, often women arrive at the motherhood without community and family models, and without an effective support network from the services. The aim of the study is to investigate mothers' perceived maternal competence (self -efficacy) and its possible correlations with pregnancy, birth and breastfeeding outcomes.

Methods: A retrospective observational study was conducted on a sample of mothers from all over Italy, using an online survey conducted from August to October2023.The questionnaire consisted of 26 questions including the Brief Parental Self-Efficacy Scale.The instrument used a score from 5 to 25; we used a score of 15 as cut-off for perceived low or high self-efficacy.Statistical analysis was performed with the chi-square test and subsequently, the Odds Ratio was calculated to define how statistically strong the association is between the BPSE score obtained and specific variables studied.

Results: The sample consisted of 4553 mothers.56.6% were women between the ages of 31 and 40 and 28.7% were women over 40 years old.20% of the women in our sample suffered from postpartum depression. The women in our sample report having received help in caring for their first child in 42% of the cases from their partner and in 30% of the cases from other family members.The mean BPSE score was 19.45.Women who obtained a BPSE Score >15 were more likely to have received support from their partner(O.R:1.4;C.I:1.1-2.0). Women who scored a BPSE Score<15 were less likely to have had support from partners/family members (OR:1.5;C.I:1.1-2.0). Women with a BPSE Score<15 were more likely to have experienced postpartum depression (OR:1.4;C.I:1.1-1.8).

Conclusions: Our study shows that the woman in particular who becomes a mother, cannot be left alone; she needs emotional and environmental support so that she can rediscover within herself the value, competence and power of motherhood.

Key messages:

- Action must be taken so that, along with improved health care, the network of social interventions for new mothers and couples is strengthened.
- The woman, in particular who becomes a mother, cannot be left alone.

Abstract citation ID: ckae144.114

Intergenerational Transmission of Overweight and Obesity among Preschool Children in Sweden

Marie Lindkvist

H Kodagoda[1], M Lindkvist[1], A Ivarsson[1], S-A Silfverdal[2], M Vaezghasemi[1]
[1]Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden
[2]Department of Clinical Sciences, Pediatrics, Umeå University, Umeå, Sweden
Contact: marie.lindkvist@umu.se

Background: Child overweight including obesity (OWOB) has quadrupled globally, since 1975. It affects a third of European children and even higher rates persist among expectant parents. Parental pre-pregnancy body mass index (BMI) and health behaviours are known to influence offspring health. Thus, this study aimed to investigate the link between parental and children's OWOB, alongside parental socio-economic and other factors.

Methods: This is a population-based repeated cross-sectional study utilized data from the Salut Programme in Västerbotten, Sweden, and Swedish national registers, including 5,937 of 3-year-olds and their parents. Logistic regression analyses were used to examine the association of child BMI with prenatal BMI and other factors. Further, the Relative Excess Risk due to Interaction (RERI) arising from the interplay between parent's OWOB status in relation to their children's OWOB was calculated.

Results: OWOB prevalence rates for 3-year-olds, expectant mothers, and their partners were 15.1%, 29.1%, and 53.5%, respectively. Both parent's OWOB significantly affected children's BMI (with strongest association for mothers). The Relative Excess Risk due to interaction (RERI) was positive for children's OWOB if both parents were obese, showing an additive interaction effect of individual parental obesity status. The odds for a child to be OWOB was 2.88 (1.83-4.43) if both parents were obese compared to if none of them were obese.

Conclusions: OWOB among preschool children remain an important public health concern in Sweden. Based on the study findings, Sweden's regional and national public health initiatives should prioritize targeting parental overweight and obesity as a key strategy to reduce the burden of OWOB among children. Furthermore, the resemblance of these results with comparable studies across the world, emphasizing the importance of initiating interventions with parents before pregnancy or even earlier.

Key messages:

- Parental combined obesity status significantly increase the odds of childhood overweight and obesity.
- The importance of initiating interventions with parents before pregnancy for better health outcomes related to child BMI.

2.O. Oral presentations: Mental health of migrant populations

---

Abstract citation ID: ckae144.115

Labour migration and mental health of left-behind children in Georgia: a mixed methods study

Khatia Antia

K Antia[1,2]*, J Račaitė*[3]*, G Šurkienė*[3]*, V Winkler*[2]
[1]Prevention and Evaluation, Leibniz-Institute for Prevention Research and Epidemiology – BIPS, Bremen, Germany
[2]Heidelberg Institute of Global Health, Heidelberg University, Heidelberg, Germany
[3]Department of Public Health, Institute of Health Sciences, Faculty of Medicine, Vilnius University, Vilnius, Lithuania
Contact: antia@leibniz-bips.de

Background: Global migration is on the rise, and as a result, millions of children are left in their home countries while their parents migrate abroad. Little is known about the mental health of left-behind children (LBC) in Eastern Europe. The study addresses this research gap in Georgia, a leading migrant-sending country in the region.

Methods: Applying convergent parallel design, this mixed methods research integrates a qualitative study with schoolteachers from six public schools in Samegrelo and Guria regions (6 focus group discussions and 6 in-depth interviews) (i); a school survey with 933 adolescents (ii) from 18 public schools, (12-18 age group, internalizing and externalizing problems assessed with Aschenbach's "Youth Self-Report" questionnaire), and a qualitative study using life-narrative interviews with 39 adolescents (iii). We analysed qualitative data using reflexive thematic analyses and applied multiple linear regression to analyse quantitative data.

Results: The Quantitative and qualitative findings converge in some respects while diverging in others. Schoolteachers perceive migratory separation as a traumatizing life event, making children vulnerable to mental health issues. Similarly, schoolchildren perceive separation from parents as a stressful life event; however, they also acknowledge positive aspects of migrant labour, such as material benefits. From the perception of LBC, close family ties, friendships, school support, and optimism help with coping. This study also revealed a gender disparity, with boys exhibiting more rule-breaking behaviour and girls performing worse on most Youth Self- Reported syndrome scales. Regression analysis showed associations between adolescents' problem behaviours and relationships with family members, friendships, and school environment.

Conclusions: This research found that parental migration effects on children are complex and depend on individual and transnational family characteristics.

Key messages:

- Left-behind children may need emotional and academic support.
- Strengthening family ties, supportive school environment and friendships contribute to adolescents' coping with parental migration.

Contact: benedetta.armocida@iss.it

Issue/Problem: Health inequities persist across European countries, impacting the distribution, prevention, and management of non-communicable diseases. With increasing population diversity and improved understanding of the intersectional nature of drivers of health inequities, narrowing inequities calls for systematic integration of diversity perspectives into equity-driven policy and practice.

Description of the problem: The EU-co-funded Joint Action on CVDs and diabetes (JACARDI, 11/2023-10/2027) project with 76 partners from 21 countries and 142 national-level projects (later pilots), applies a structured approach for integrating equity and diversity perspectives within all project structures. This is achieved through design of a common methodological framework and terminology glossary for all thematic work packages (WPs) and their pilots, which are further supported through capacity building sessions and consultations.

Results: The "4Cs" framework (Critical reflection; Context and data; Co-design; and inclusive and accessible Communications) for integrating equity and diversity principles in JACARDI was developed based on results of focus group interviews with WP leaders ($n = 24$) and review of previous literature. This framework was applied as a lens to be applied in the planned activities by WPs and pilots, elaborated in an equity and diversity maturity matrix aligned with the XV methodological steps for pilot implementation. Additionally, equity and diversity indicators were integrated into harmonized context analysis questionnaires for national focal points of each partner country, as well as into the methodology for pilot assessment and reporting.

Lessons: Equity and diversity perspectives should be integrated into the core structures of project implementation, supported by practical tools, trainings and practical consultations to improve adherence and collaborative understanding across project partners.

Key messages:

- Equity and diversity integration into core structures are essential for tackling health inequities and the NCD-related social gradient in Europe.
- Encouraging critical reflection among JACARDI partners is pivotal for initiating a paradigm shift towards equity and diversity inclusion.

Abstract citation ID: ckae144.117

Increasing inequalities in mortality among individuals with a foreign background in Sweden

Alexander Miething

A Miething[1], A Dunlavy[1], SP Juárez[1]
[1]Department of Public Health Sciences, Stockholm University, Stockholm, Sweden
Contact: alexander.miething@su.se

Background: Previous research indicates that migrants in high-income destination countries not only experience a mortality advantage but also demonstrate lower or absent socioeconomic inequalities in mortality compared to the general native population. Yet the extent to which an income mortality gradient may also be evident among the descendants of migrants has been largely unexamined. Existing evidence has revealed that descendants of migrants face mortality risks higher than both migrants and their native-born peers.

Methods: This study utilizes longitudinal population registries covering the entire registered population of Sweden from 2004 to 2016. The study population comprises individuals aged 25 to 64, employing an open cohort design. Using Poisson regression, we examine the relationship between income rank position and cause-specific mortality among native-origin Swedes and eight nativity groups based on individuals' country/region of birth, age of migration or parental origin.

Results: While foreign-born individuals who migrated as adults exhibited lower inequalities in all-cause mortality compared to native-origin Swedes, descendants of immigrants, particularly those with non-European backgrounds, show larger inequalities. Examination of specific causes of mortality revealed that external causes, notably accidents and assaults, account for increased disparities among non-European foreign-born men who migrated during childhood and male descendants of immigrants with non-European backgrounds.

Conclusions: Income-related inequalities in mortality are less pronounced among migrants compared to the native-born majority population in Sweden and tend to be higher among descendants of migrants, depending on gender and parental origin. The analysis highlights the role of external causes of mortality in shaping these inequalities, indicating that income disadvantages, augmented by a migrant background during upbringing, amplify specific health risks within these groups.

Key messages:

- The study reveals lower mortality inequalities among migrant adults but a higher magnitude of inequalities among male descendants of immigrants, especially with non-European backgrounds.
- Income disparities, combined with migrant backgrounds, amplify health risks among descendants of migrants in Sweden, underscoring the need for tackling social inequalities.

Abstract citation ID: ckae144.118

Unmet healthcare needs in migrant population in Finland: comparative analysis between 2014 and 2022

Hannamaria Kuusio

S Nykänen[1], R García Velázquez[1], L-K Tynkkynen[2], R Lämsä[3], H Kuusio[1]
[1]Public Health and Welfare, Equality, THL, Helsinki, Finland
[2]Health Economics and Equity in Health, THL, Helsinki, Finland
[3]Department of Public Health, University of Helsinki, Helsinki, Finland
Contact: hannamaria.kuusio@thl.fi

Background: Timely access to health services is one of the cornerstones of universal health coverage. However, various individual and structural factors remain as barriers to meet this goal. Access to physician services remains a concern for migrant populations, with a substantial proportion experiencing unmet healthcare needs, surpassing rates observed in the general population of Finland. This study aims to assess temporal changes in unmet healthcare needs among migrants in Finland across the years 2014, 2018, and 2022, investigating potential disparities across population groups.

Methods: Three nationally representative datasets derived from cross-sectional surveys are used; Survey on work and well-being among people of foreign origin 2014-2015 (UTH), Survey on well-being among foreign-born population 2018-2019 (FinMonik) and National survey on health, well-being, and service use among foreign-born population 2022-2023 (MoniSuomi). We analysed data from individuals aged 20 to 64 years. Multivariate logistic regression analysis, adjusting for sociodemographic and socioeconomic factors, is employed to compare unmet healthcare needs in migrant populations with the Finnish general population.

Results: A significant increase was found in unmet healthcare needs among migrant populations in Finland from 2014 to 2022. Prevalence rates rose from 25.0% in 2014 to 24.9% in 2018 and reached 33.7% in 2022. Preliminary analysis suggests that younger age, migration from the Middle East and Africa, and refugee status are associated with higher odds of experiencing unmet healthcare needs.

Conclusions: The escalating prevalence of unmet healthcare needs between 2014 and 2022 among migrant populations in Finland is a cause for concern. This research underscores the urgent need for policymakers, healthcare providers, and community advocates to address healthcare inequities and ensure equitable access to healthcare, to ensure universal health coverage for all individuals in Finland.

Key messages:

- The prevalence of unmet healthcare needs between 2014 and 2022 among migrant populations in Finland has escalated, compared to the Finnish general population.
- Preliminary analysis suggests that younger age, migration from the Middle East and Africa, and refugee status are associated with higher odds of experiencing unmet healthcare needs.

The European Commission (EC) is responsible for planning, preparing and proposing better and simpler new policies, avoiding unnecessary burdens, and involving citizens and any interested stakeholders in the decision-making process. The EC is also responsible for evaluating existing European laws and proposing improvements where necessary. In achieving these goals, the EC has defined its "Better regulation" (BR) policy, governed by a set of common principles and established procedures, including the assessment of the most significant impacts on the economic, environmental, and social domains, among others. These assessments should be based on the best available evidence, which refers to multiple sources of data, information and knowledge, including quantitative (e.g. statistics and measurements) and qualitative data (e.g. opinions, stakeholder input, scientific and expert advice). BR's principles and procedures also ensure the implementation of more effective, coherent, relevant and efficient initiatives, improving the transparency, participation, learning and accountability. With this approach, the EC also seeks to guarantee that all legislative proposals contribute to the 2030 sustainable development agenda, and to better planetary health. As stated in the EU Treaty (Article 168 TFEU), "a high level of human health protection shall be ensured in the definition and implementation of all Union policies and activities". Therefore, assessment of any potential health impacts should be addressed during the policy cycle. Health gains and health losses can be direct or indirect, and particular attention should be given to specific population groups that may be disproportionally affected by the intervention (e.g., children, persons with disabilities, pregnant women, the elderly, low-income groups). The design and improvement of healthy public policies was precisely the ultimate goal for which the WHO proposed in 1999 the Health impact assessment (HIA) approach. HIA practice is grounded in the WHO's health definition, which encompasses physical, mental and social health and wellbeing, and it is closely linked to the social determinants of health framework and to Health in All Policy strategy. Several quantitative methods are available to estimate health impacts within HIA applied to policies. The environmental burden of disease (EBD) is one of them aiming at quantifying the impact of a health problem as measured by avoidable mortality/morbidity, financial cost, or other indicators attributed to environmental factors (e.g. exposure to chemicals). EBD approach allows policy actions to be based on estimated health gains, rather than on "safe environmental levels" of the risk factor alone. The main aim of this session will be to analyses different quantitative approaches and provide some recommendations and good practice on how epidemiological evidence can support the policy cycle, improving data collection, evaluation and reporting suitable to such context.

Key messages:

- Refining epidemiologic data recording and reporting, especially uncertainty characterisation, is necessary to improve weight-of-evidence evaluations for a better regulation process.
- Environmental burden of disease, as a tool for quantifying health impacts, provides crucial information to policy makers on how to regulate for better protecting population health.

Health impacts methodology in the European Commission

Vitus-Cornelius Van Rij

VC Van Rij[1], *A Schaefer*[1]
[1]DG SANTE, European Commission, Brussels, Belgium
Contact: Vitus-Cornelius.Van-Rij@ec.europa.eu

The state of play in the implementation of health impacts methodology within European Commission impact assessments reveals both advancements and challenges. The Commission has acknowledged the significance of assessing health impacts and has provided a generic methodological description, as outlined in Tool #32 of the Better Regulation guidelines. However, translating this guidance into practical application encounters obstacles stemming from challenges intrinsic to the policy in question, a lack of skills and knowledge, data gaps, and complexities in establishing causal links. In EU policymaking, health impacts are consistently appraised in relevant Impact Assessments across various policy areas, but the methodological intricacy varies. In the fields of public health, occupational safety, and environmental protection, econometric modelling is often employed to quantify potential health impacts rigorously. This involves sophisticated analytical tools designed to capture the complexity of the interactions. Conversely, in areas where the link between policies and health outcomes is less direct (e.g. food safety) or where data limitations pose challenges, a more qualitative appraisal is applied. This acknowledges the limitations in precisely quantifying health impacts and focuses on providing a nuanced understanding of potential health effects based on available information.

[2]Topexpert Public Health Foresight, RIVM, Bilthoven, Netherlands
Contact: henk.hilderink@rivm.nl

Burden of disease, expressed in disability-adjusted life years, is a very powerful metric to assess population health. It combines both mortality, i.e. years of life lost, and morbidity, i.e. years lost due to disability and is increasingly used within public health policy making. However, the substantial demand for (good quality) data, the involved methodological choices and the complexity of the concept make it also challenge to calculate Burden of Disease and to have the results properly used, e.g. in the policy making process. The concept of Knowledge translation provides a systematic way of dealing with the synthesis, dissemination, and application of research findings to improve health outcomes and inform policymaking. Understanding the burden of disease is fundamental to effective knowledge translation, as it helps prioritize research efforts, target interventions to address the most significant health challenges, and allocate resources efficiently. The four different models of knowledge translation, i.e. the push, pull exchange and integrated model, provide a sound theoretical basis to strengthen the use of burden of disease in policy making. To have an effective way of knowledge translation, the following basic facets are important: timing of providing results, having policy-relevant results, for whom are the results relevant and in what way to get the results to a potential user. This presentation will focus on how to deal with these different aspects, building on experiences of burden of disease studies throughout Europe.

Over the past 50 years, the European Union has built a robust legal framework for managing chemicals. This framework balances the benefits of using chemicals for societal well-being and economic prosperity with the need to protect human health and the environment from potential risks. As part of the EU's Zero Pollution ambition in the context of the Green Deal, the European Commission adopted in 2020 the Chemicals Strategy for Sustainability, with the aim to better protect human health and the environment from harmful chemicals, while boosting innovation by promoting the use of safer and more sustainable chemicals. Assessing quantitative health impacts within the EC Better Regulation guidance typically involves indicators measuring the environmental burden of disease (EBD), providing a useful mean for legislators to evaluate the benefits of policy actions both in terms of health gains and cost. While such analyses are common in air pollution studies, challenges arise in the chemical legislation area, particularly in non-occupational settings, where the population is exposed to low concentrations of many chemicals through multiple exposure routes. In such contexts, the intrinsic complexities linked to exposure characterization and to the assessment of causality between the exposure and the health outcome may hinder the estimation of benefits of legislative actions. Debates may arise regarding the reliability of the underlying epidemiological studies, making challenging for policymakers to ascertain the robustness and generalizability of the findings of such analyses. Our work provides a summary and analysis of recent case studies in the context of chemicals. We focus on how epidemiological evidence was used in conducting EBD analyses in supporting better formulation of EU polices of chemicals.

2.Q. Skills building seminar: Publishing and disseminating your research: How to get published, and what then?

Abstract citation ID: ckae144.123
Organised by: EUPHA
Chair persons: Monica Brînzac (EUPHAnxt)
Contact: Peter.Allebeck@ki.se

Getting your public health research published can be a real challenge, and the publishing process is not always clear. Often it takes a lot of time, effort and perseverance. In this skills building workshop, participants will be able to learn the ropes from the Editor-in-Chief and the Publisher (OUP) of the European Journal of Public Health (EJPH), EUPHA's scientific Journal. The EJPH is a well-established multidisciplinary, Open Access journal that covers a broad scope of public health topics. It's current impact factor is 4.4. The workshop will have the format of an interactive clinic and will start with short presentations by the Editor-in-Chief of the EJPH and the Publisher on how to write, how to disseminate your findings, and tools the publisher has for helping promote your research for the best impact. The Editor-in-Chief will focus on what makes manuscripts attractive to editors and reviewers, while the publisher will give an overview of the publishing process, important aspects of the wider publishing industry (including how to publish your work Open Access) and give authors tips of how to promote their articles post-publication. After that, there will be ample time for participants to ask their questions to the panellists. This skills-building workshop will be of interest to anyone who would like to increase their chances of getting published and who would like to learn more about creating impact with their publications. The session should in particular be helpful for young researchers who do not have a lot of publishing experience yet.

Key messages:

- Think about relevance to public health, and what your research adds to science and policy.
- Think about what tools you can use to disseminate your findings.

Speakers/Panelists:
Peter Allebeck
Karolinska Institute, Department of Global Public Health, Stockholm, Sweden
Rachel Moriarty
Oxford University Press, Oxford, UK

3.A. Round table: Towards a research agenda for burden of disease studies

Abstract citation ID: ckae144.124
Organised by: EUPHA-ECO, European Burden of Disease Network, OECDChair persons: Vanessa Gorasso (EUPHA-ECO), João Vasco Santos (EUPHA-ECO)
Contact: vanessa.gorasso@sciensano.be

What are the most relevant diseases in a country? Which risk factors are the strongest contributors to disease and death? How is the impact of different diseases evolving over time, and how does it compare between countries and within subnational units? As the need for prioritising the use of available resources constantly increases, a timely, sound and comprehensive answer to these fundamental questions is more than ever needed to inform public health decision-making. Driven by the impact of the Global Burden of Disease study, several researchers and national and international health institutes have adopted the burden of disease approach to address these questions. The complexity of the burden of disease approach however resulted in major disparities in research capacity across Europe. Furthermore, the current burden of disease landscape remains scattered, and researchers struggle to translate their findings to decision makers. The European Burden of Disease Network (COST Action CA18218) addresses these challenges by acting as a technical platform for integrating and strengthening capacity in burden of disease assessment across Europe and beyond. The different activities of the Network have helped to improve the quality and comparability of burden of disease estimates and increase their use in policy and practice. However, still many challenges remain. As a way of looking into the future applications of the burden of disease metrics, the European Burden of Disease Network took the initiative of developing a research agenda based on barriers and weaknesses identified within the activities of the network and input from researchers working regularly with burden of disease. As an initial step, a series of systematic literature review was carried to identify barriers and weaknesses in the computation of burden of disease estimates. These highlighted the differences in methodological choices that could hamper the comparability of results. This point was later identified as a key element of future development (abstract one). Secondly, the members of the network were consulted. Online questionnaires and structured consultations led to the identification of four main pillars of the future research agenda: transparency and availability, refining current methods, new applications, and prioritization of topics.

In this workshop, we will present different activities within and outside the Network that correspond to the four pillars above described (abstract 2-4) and start the reflection on the future of burden of disease estimated.

Key messages:

- Despite the wide use of the burden of disease approach, many challenges were identified in the replication of the methods and the need for further developments.
- A new research agenda for burden of disease estimates will formalize a way to strengthen methodologies, interpretations and applications.

Abstract citation ID: ckae144.125
Improving transparency: Development of reporting guidelines for burden of disease studies

Brecht Devleesschauwer

The burden of disease (BOD) approach, originating with the Global Burden of Disease (GBD) study in the 1990s, has become a cornerstone for population health monitoring. Despite the widespread use of the Disability-Adjusted Life Year (DALY) metric, variations in methodological approaches and reporting inconsistencies hinder comparability across studies. To tackle this issue, we set out to develop guidelines for reporting DALY calculation studies to improve the transparency and comparability of BOD estimates. The development of the STROBOD statement began within the European Burden of Disease Network, evolving from initial concepts discussed in workshops and training sessions focused on critical analysis of BOD studies. In 2021, a working group was formed to refine the preliminary version into the final Standardised Reporting of Burden of Disease studies (STROBOD) statement, consisting of 28 items structured across six main sections. These sections cover the title, abstract, introduction, methods, results, discussion, and open science, aiming to ensure transparency and standardization in reporting BOD studies. Notably, the methods section of the STROBOD checklist encompasses aspects such as study setting, data inputs and adjustments, DALY calculation methods, uncertainty analyses, and recommendations for reproducibility and transparency. A pilot phase was conducted to test the efficacy of the STROBOD statement, highlighting the importance of providing clear explanations and examples for each reporting item. The inaugural STROBOD statement offers a crucial framework for standardizing reporting in BOD research, with plans for ongoing evaluation and potential revisions based on user feedback. While the current version focuses on general BOD methodology, future iterations may include specialized checklists for distinct applications such as injury or risk factor estimation, reflecting the dynamic nature of this field.

Refining current methods: Including comorbidity adjustment in burden of disease estimates

Michael Porst

M Porst[1], D Yessimova[1], E von der Lippe[1]
[1]Epidemiology and Health Reporting, Robert Koch Institute, Berlin, Germany
Contact: PorstM@rki.de

When quantifying years lost due to disability (YLD), a correction for multimorbidity (or comorbidity, COMO for short, in the Global Burden of Disease study) is necessary to avoid overestimating the morbidity-related burden of disease. Such an overestimation occurs if the calculation of disease frequencies does not consider that persons are counted more than once in a cross-sectional year. In such cases, the time spent with illness at an individual level can add up to a value of more than 1 year. To avoid this, a microsimulation is used that corrects the YLD to a maximum value of 1. A standard approach is to generate a synthetic data set by age, gender and region. Using prevalence estimates and based on (independent) Bernoulli experiments, a vector of diseases is randomly assigned to these (pseudo) individuals. The assignment is usually independent, which means that the presence of one disease has no influence on the presence of another disease. At this level, the individual YLD are then proportionally corrected (the maximum value is 1) and extrapolated to the population. However, there is evidence that disease clusters exist at the individual level. As part of the further development of such multimorbidity correction methods, a new approach will be tested and applied to generate a more realistic population of interest. This considers correlation patterns (1st step) between diseases when generating the synthetic data (2nd step) on the basis of Bernoulli experiments. For this purpose, the existing approaches need to be enriched by (pairwise) correlations between diseases, which requires the inclusion of additional epidemiological data sources. It is assumed that this will lead to an additional correction of the YLD, as they are still overestimated under an independent assignment.

Working on new applications: Use of economic evaluation in burden of disease estimates

Michele Cecchini

M Cecchini[1], A Lerouge[1]
[1]Health Division, OECD, Paris, France
Contact: Michele.Cecchini@oecd.org

Burden of disease (BoD) analyses provide policy-makers with useful evidence to prioritise policy responses to major public health threats. Increasingly, however, epidemiological data alone is not considered as sufficient to inform decisions, particularly when funding is allocated within a single government approach and different sectors compete for a larger share of the overall budget. Similarly, other funders, such as charities and foundations, may want to prioritise budget allocation between health and non-health objectives. In all these cases, traditional BoD analyses need to be complemented by economic evaluations. In its simplest form, the economic component may mean adding an assessment of the healthcare costs caused by the diseases in the study. A more comprehensive, though still with limitations, approach is to use monetary values to measure the extent to which individuals are willing to exchange their income - which can be spent on other things - for the health outcomes they experience. Finally, in its most advanced and comprehensive form, analyses can include assessments of a number of relevant dimensions, such as those in the OECD's Better Life Index. The latter approach is also consistent with, and its results support the implementation of, a health in all policies approach. This presentation will look at traditional and innovative approaches that can be used to add an economic dimension to BoD analyses. After introducing the rationale and key methodological issues of each approach, the presentation will discuss the advantages and disadvantages of each methodology and will identify areas where their use can be beneficial in guiding the decision-making process. Examples of the use of these methodologies in real-world analyses will also be presented to support the theoretical part of the discussion.

Abstract citation ID: ckae144.128
Working on new topics: Estimation of the burden of zoonotic diseases

Carlotta di Bari

C di Bari[1,2]*, B Devleesschauwer*[1,2]
[1]Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]Translational Physiology, Infectiology and Public Health, Univeristy of Ghent, Ghent, Belgium
Contact: carlotta.dibari@sciensano.be

Zoonoses, diseases naturally transmitted between vertebrates and humans, represent significant global health threats. These diseases not only affect human health but also impose a considerable burden on animal populations, emphasizing the need for a One Health approach that integrates strategies across human, animal, and environmental health sectors. The socioeconomic impacts of zoonoses are profound in low- and middle-income countries, disrupting production systems, impacting livelihoods, and compromising food security. Populations in these regions are excessively affected, highlighting the urgent need for a comprehensive approach. The disability-adjusted life year (DALY) quantifies disease burden in terms of morbidity and mortality. The zoonotic DALY (zDALY) expands this metric by incorporating the burden on animals through the 'animal loss equivalents', accounting for both fatal and non-fatal outcomes in livestock. However, zDALYs do not encompass broader economic impacts associated with prevention and treatment. Cost of illness (COI) studies further quantify the financial costs due to health issues; ad hoc approaches can be used to quantify other costs related to animal disease control and eradication, trade and movement Implications, or loss of consumer confidence. While few zoonoses, such as cystic echinococcosis and brucellosis, have comprehensive data across these metrics, most do not. While these metrics provide complementary insights, no holistic metric currently encompasses all necessary aspects to fully assess the burden of zoonoses within a One Health framework. This presentation aims to offer state-of-the-art estimates of the disease burdens of zoonoses, employing DALY, zDALY, and COI studies. It will explore how to integrate these metrics from a One Health perspective. Indeed, only by integrating health and economic metrics that consider the well-being of humans and animals, can the One Health approach effectively be developed for zoonotic diseases.

3.B. Scientific session: Why do we need clear understanding of digital public health interventions?

Abstract citation ID: ckae144.129

Organised by: ASPHER Digital Public Health Taskforce, Leibniz ScienceCampus Digital Public Health Bremen (Germany)
Chair persons: Laura Maaß (Germany), Mariusz Duplaga (Poland)
Contact: laura.maass@uni-bremen.de

The rapid proliferation of digital technologies in health and public health has led to various terms and concepts, often used interchangeably or inconsistently. This ambiguity hampers communication, complicates research efforts, and undermines the effectiveness and adaptation of interventions. Without a clear understanding of such concepts, stakeholders face difficulties using, evaluating, and regulating digital public health (DiPH) initiatives. Thus, there is an urgent need to establish a common language - across academic disciplines and in the science-to-practice/policy transfer - to foster collaboration, ensure accountability, and maximize the impact of DiPH interventions globally. This workshop highlights the need for a cross-sectoral understanding of terms and concepts related to DiPH interventions. For this, we identify effective strategies for engaging diverse populations in DiPH interventions, considering accessibility, usability, and cultural sensitivity. Additionally, we present how a more precise understanding of these concepts will impact positive population-health outcomes of DiPH interventions. Finally, we discuss DiPH terminology enhancement regarding data protection, highlighting the boundaries of digital interventions within and outside health policies and public health systems, given the diversity of the legal frameworks applicable in either case. We aim to facilitate interdisciplinary collaboration and knowledge exchange, fostering a shared understanding of terminology and best practices. This will advance DiPH by promoting clarity, rigor, and transparency in research and practice. Shared understandings of key concepts will eventually enhance the design, implementation, and evaluation of DiPH interventions, leading to improved population health outcomes and informing evidence-based policymaking and regulatory frameworks. The workshop consists of four presentations and a 20-minute panel discussion on increasing understanding dissemination. The first talk highlights multi-stakeholder perspectives (including researchers, technicians, health and medical practitioners, and the general public) on the ever-changing terminology of DiPH concepts. The second presentation showcases how these varying perceptions influence the academic representation of DiPH interventions and that interventions - although summarized under the same terminology - drastically vary concerning their use case and characteristics. The third speaker will discuss why a clearer understanding of these terms is needed to increase engagement with DiPH interventions for positive population health outcomes and identify effective DiPH interventions based on evidence. The last talk explains why unclear terminology or standards threaten populations and result in over- or under-regulation of DiPH interventions. Overall, this workshop catalyzes advancing the DiPH agenda in Europe, empowering stakeholders to harness the full potential of technology for promoting population health.

Key messages:

- When we create technical terms, it is our professional approach, characterized by our academic background. It does not necessarily transfer to other domains or the general population.
- Digital Public Health can transform global healthcare. However clear & harmonized terminologies are crucial for comparing evolving technologies & paving the way for transformative digital healthcare.

Abstract citation ID: ckae144.130
A long journey from telemedicine to digital (public) health: the vision of different stakeholders

Mariusz Duplaga

M Duplaga[1,2]
[1]Institute of Public Health, Jagiellonian University, Medical College, Cracow, Poland
[2]Digital Public Health Taskforce, ASPHER, Brussels, Belgium
Contact: mariusz.duplaga@uj.edu.pl

The healthcare system willingly adopts new innovative means of communication and solutions offered by computer science. Telemedicine was one of the first terms used in this context. It was initially associated with providing medical services but quickly extended to other areas of health-related activities, including public health. The growth of the global web yielded new prospects for the provision of health services, also resulting in new terms to name the use of information and telecommunication technologies in healthcare. E-health, stemming from the end of 90ies in the 20th century, was initially defined as a new domain strongly associated with public health, especially in the context of access to health information. Quickly, its understanding was extended to all health-related interventions based on innovative digital technologies. Today, digital health and digital public health have emerged as the key terms, signifying the next phase of emerging applications that leverage the advancements made on the technical front. The medical community is probably more inclined to use the former term, while public health professionals are dedicated to the latter. But do these terms carry distinct meanings? Or is it merely a matter of the professional group's background? Is the focus on individual or population health a differentiating factor? In the meantime, business and technical communities have developed the concept of Health 4.0. This concept emphasizes using technologies like the Internet of Things, cloud computing, big data, and artificial intelligence. However, digital (public) health benefits hugely from these solutions. One can ask whether every professional community needs other concepts and new terms for naming fields, resulting from the multidisciplinary effort. And where are the plain people in this landscape? Do they have sufficient digital and health literacies to accept new modes of health service delivery?

Abstract citation ID: ckae144.131
Same term, but unequal understanding: differences in digital public health intervention features

Laura Maaß

[4]Leibniz Institute for Prevention Research and Epidemiology, Bremen, Germany
[5]Institute for Information, Health and Medical Law, University of Bremen, Bremen, Germany
[6]Institute for Public Health & Nursing Research, University of Bremen, Bremen, Germany
Contact: laura.maass@uni-bremen.de

Digital technologies have transformed healthcare delivery and public health, with many countries integrating interventions such as online consultations, electronic health records, and telemedicine to improve population health and healthcare accessibility. Multinational assessments for benchmarking system maturity ask for the degree of implementation of such tools. However, are these interventions as comparable as they claim to be? This talk presents a qualitative analysis of 179 digital public health (DiPH) interventions described in scientific articles. We categorized interventions based on their implementation stages, public health functions, and reported and non-technical features. Telemedicine, health apps, and electronic health record interventions dominated the diverse landscape. While these technology groups already differed greatly in their functions, we identified equally significant differences in the reported intervention characteristics within the groups. For example, telemedicine was not only used in healthcare settings for patients and health professionals but also in primary prevention and research for researchers, policymakers, and healthy individuals. Different interventions reported varying functions, such as remote monitoring, self-monitoring, alarm systems, patient motivation, and user empowerment modules. So, is there one common telemedical intervention? No. Instead, all individual technologies differed to varying degrees. The analysis underscored the diversity of DiPH interventions among and within intervention groups and highlighted the importance of precise terminology for effective planning and evaluation. Instead of using broad classifications like 'telemedicine,' interventions should be defined and communicated based on specific technological functions, non-technical characteristics, use cases, and user groups. This approach will promote cross-disciplinary collaboration and foster international comparability across DiPH systems.

Contact: saleem@leibniz-bips.de

Digital behavioral change interventions (DBCI), leveraging digital technology to promote cognitive behavioral therapy or positive psychology techniques, can potentially revolutionize health promotion. With applications across a spectrum of health behaviors-from managing common mental health disorders to enhancing physical activity, addressing smoking cessation, alcohol use, and weight management-these interventions offer promise for both healthy and clinical populations. However, their effectiveness hinges significantly on user engagement. Digital interventions are prone to attrition due to their self-help and unguided nature, which impedes their translation from research to real-life settings. This talk discusses the findings of a scoping review to shed light on these complexities. Firstly, we explore the various methodologies used to evaluate engagement across studies, hindering effective comparison and understanding. Secondly, we address the lack of systematic assessment of engagement strategies, advocating for experimental research to fill this gap. Lastly, we emphasize the need to establish an optimal level of engagement for desired outcomes, noting that continuous engagement may not always be conducive to behavioral change interventions, which aim to instill lasting changes in individuals. This underscores the importance of comprehensive assessment using both objective and subjective measures. In conclusion, engagement with digital interventions encompasses both quantitative usage metrics and qualitative subjective experiences, highlighting the need for comprehensive assessment beyond the mere evaluation of frequency or duration. Contrary to common belief, increased engagement does not always lead to better outcomes. Too much engagement can lead to exhaustion, while too little can result in inefficiency. Therefore, designing a DBCI that encourages optimal use is essential, fostering a balance that maximizes effectiveness while minimizing adverse effects.

Enhancing digital public health (DiPH) terminology may foster a better understanding of the legal framework that grounds the use of personal health data within and outside public health policy and public health systems. Terminology accuracy is, therefore, relevant to understanding the data protection regulations that apply to DiPH interventions. The broader or narrower possibilities for using personal health data in digital health interventions depend on the legal basis that justifies (or not) the access to personal health data, whether inside public health policy or outside (e.g., in private health companies). In the context of digital health policy for DiPH, using personal health data is based on public law, analyzing proportionality, necessity, and the legitimacy of the interest. In contrast, for digital health interventions outside public health policy or in an individual clinical approach (like in digital health), the use of personal health data is based on informed consent. Brazilian data protection law (LGPD) and European GDPR provide the legal basis for public health systems' use of health data in health policy. As a result, the DiPH approach highlights the relevance of using digital technologies and health data to strengthen public health systems within the platform economy and the context of surveillance capitalism. This presentation will shed light on the expansion of digital technologies and health data in health policy in the face of data science, highlighting the need to delve into the terminology of DiPH, understanding its boundaries and legal differences from its neighbors (not twins) outside health policy. Clarifying the DiPH approach, potentially leading to standards in terminology and embedding a data protection perspective, may maximize the accuracy of the legal justification for personal health data use in health policies. DiPH, therefore, may foster data protection, public health systems, and policies strengthening with health data.

Background: The convergence of climate change and infectious diseases presents a growing public health challenge. As global temperatures continue to climb, the geographical spread of climate-sensitive diseases is shifting, underscoring the necessity for comprehensive early warning systems grounded in a One Health framework.

Methods: This retrospective observational study analyzed daily maximum temperature from May to September, between 2000 and 2018, in mainland Portugal, at a county level, obtained from a European-level gridded observations dataset. Hospital admissions with a primary diagnosis of infectious and parasitic diseases were sourced from the Hospital Morbidity Database. A distributed lag non-linear model was developed to estimate the immediate and lagged relative risks (RR) of temperature exposure on admissions, focused on a lag of 10 days.

Results: Our research reveals a 16% (95% CI: 9% - 23%) rise in the RR of hospital admissions due to infectious and parasitic diseases after exposure to extremely high temperatures (39 °C). This elevated risk persists for up to 2 days following exposure, with the second day exhibiting the largest increase at 53% (31% - 80%). Furthermore, our findings indicate a subsequent resurgence in RR, reaching 6% (2% - 11%) 9 days after exposure.

Conclusions: Our results highlight a short-term effect of extreme temperature exposure on infectious and parasitic disease admissions. This data provides valuable insights to guide policymakers in identifying critical periods of vulnerability and implementing this knowledge into heat early warning systems, contributing to developing effective public health strategies against climate change.

Acknowledgments: The authors thank Fundação para a Ciência e a Tecnologia (FCT, Portugal) for research grant UIDP/04923/2020 and NOVA National School of Public Health for access to the Hospital Morbidity Database made available for research purposes by Administração Central do Sistema de Saúde, IP (ACSS).

Key messages:

- Exposure to extremely high temperatures increases the risk of admission due to infectious and parasitic diseases by 16%, with a peak occurring two days after exposure.
- This data is essential for policymakers to identify and integrate vulnerable periods into early heat warning systems, enhancing effective public health strategies against climate change.

Integrating SDGs, One Health and transdisciplinarity into AMR Education Strategies

Avis Anya Nowbuth

AA Nowbuth[1,2], *VS Parmar*[1]
[1]Department of Neuromedicine and Movement Science, Norwegian University of Science and Technology, Trondheim, Norway
[2]Department of Research, Pan-African Organization for Health, Education and Research, Missouri, USA
Contact: anya.a.nowbuth@ntnu.no

Introduction: The increasing prevalence of Antimicrobial Resistance (AMR) threatens modern medicine, undermines food security, and impedes environmental sustainability. The complexity of AMR requires various stakeholders to contribute to mitigate this challenge. We discuss the critical need for integrating the One

Health framework, transdisciplinarity, and Sustainable Development Goals (SDGs) within AMR education; and demonstrate how these integrations enhance the effectiveness of educational strategies against AMR.

Methods: Through a review of existing literature and analysis of multiple interventions, we synthesize findings from instances where One Health strategies have been applied. We assess their effectiveness in fostering cross-sector collaboration and enhancing health outcomes, thereby providing a grounded framework for developing integrated educational strategies.

Results: Our analysis reveals that AMR education programs incorporating the SDGs and One Health principles are more likely to foster interprofessional collaboration and a deeper understanding of AMR. Case studies demonstrate that such educational approaches significantly improve the preparedness of health professionals in managing AMR through innovative and cooperative approaches. Despite the significant potential of One Health education in impacting global health positively, current interventions lack specific SDG indicators directly related to AMR, suggesting a gap in policy and global health prioritization.

Conclusions: By aligning AMR education with SDGs and One Health, there is an opportunity to enhance global health security. We call for a paradigm shift in educational strategies to effectively combat AMR, advocating for policy reforms and curriculum adjustments to incorporate these integrated approaches. The findings are crucial for educators, policymakers, and healthcare professionals aiming to redesign AMR education to be more comprehensive and globally oriented.

Key messages:

- AMR education integrated with SDGs and One Health enhances interprofessional collaboration and understanding, improving health professionals' preparedness to manage AMR effectively.
- Current AMR educational strategies lack specific SDG indicators; aligning education with SDGs and One Health can significantly boost global health security.

Abstract citation ID: ckae144.136
National early warning systems for emerging AMR in high-income countries: a systematic review

Jessica Iera

J Iera[1,2], C Isonne[1,3], C Seghieri[2], L Tavoschi[4], M Ceparano[1], A Sciurti[1], G Migliara[5], P Villari[1], F D'Ancona[3], V Baccolini[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University, Rome, Italy

[3]Department of Infectious Diseases, ISS, Rome, Italy
[4]Department of Translational Research, University of Pisa, Pisa, Italy
[5]Department of Life Sciences, Link Campus University, Rome, Italy
Contact: jessica.iera@uniroma1.it

Background: An urgent need of implementing national surveillance systems for timely detection and reporting of emerging antimicrobial resistance (AMR) was recently advocated by the World Health Organization (WHO). However, public information on existing national early warning systems (EWSs) is often incomplete. Furthermore, when findings are available, understanding these systems is challenging due to different approaches used for data collection, reporting and definitions, with a comprehensive overview on this topic currently lacking. The aim of this study was to map existing EWSs for emerging AMR, focusing on high-income countries, and describe their main characteristics.

Methods: A systematic review was performed on bibliographic databases, and a targeted search was conducted on national websites. Any article, report or webpage describing national EWSs in high-income countries was eligible for inclusion. EWSs were identified considering the emerging AMR reporting WHO framework.

Results: We identified seven national EWSs in 72 high-income countries: two (Australia, Japan) in the East Asia and Pacific Region, three (France, Sweden, United Kingdom) in Europe and Central Asia, and two (United States, Canada) in North America. The systems were established quite recently; in most cases they covered both community and hospital settings, but their main characteristics varied widely across countries in terms of organization and microorganisms under surveillance, with also different definitions of emerging AMR and alert functioning. A formal system assessment was available only in Australia.

Conclusions: A broader implementation and investment of national surveillance systems that allow early detection of emerging AMR is still needed to establish EWSs in countries and regions lacking such capabilities. A more standardized data collection and reporting is also advisable to improve cooperation on a global scale.

Key messages:

- This study provides a synthesis of publicly available information on national EWSs for emerging AMR in high-income countries, highlighting the urgent need for a broader implementation of such systems.
- Main characteristics of EWSs have been outlined, varying widely across countries. Findings could help stakeholders in strengthening current standard national AMR surveillance systems.

[3]Athena Institute, VU Amsterdam University, Amsterdam, Netherlands
Contact: t.cesuroglu@erasmusmc.nl

Introduction: Effective preparedness and response to infectious disease (ID) outbreaks demand collaboration among diverse stakeholders from public health and beyond. However, the organization and roles of stakeholders vary widely across countries and have evolved notably during the COVID-19 pandemic. Novel methodologies are essential to analyze and bolster collaboration in this context. We conducted a scoping review to explore methods utilized for evaluating multistakeholder collaboration in ID outbreak preparedness and response.

Methods: We comprehensively searched scientific and grey literature using keywords such as evaluation of collaboration, stakeholder analysis, (multi)stakeholder/multisectoral collaboration, and network coordination in PubMed, GoogleScholar and Google. Given the limited literature on ID outbreaks, we expanded our scope to include other public health emergencies (PHE) and related fields. Publications were analyzed to discern their aims, fields served, and methodologies employed.

Results: Twenty pertinent publications from Africa, Europe, North America, and Oceania were identified. These publications addressed diverse aims and fields, including stakeholder identification, network mapping in outbreak management and One Health initiatives, enhancing multistakeholder/ multisectoral collaboration for PHE response, primary care partnerships, and evaluating governance of networks in public policy. Methodologies encompassed network analysis, stakeholder mapping, and evaluative frameworks tailored to specific contexts. Common themes included trust-building, shared goals, decision-making processes, and information exchange.

Conclusions: The literature presents varied dimensions crucial for developing methodologies to evaluate multistakeholder collaboration in ID outbreak contexts. These evaluations ultimately will lead to strengthened multisectoral collaboration and coordination, and better preparedness and response for ID outbreaks.

Key messages:

- Effective evaluation methodologies are crucial for enhancing multistakeholder collaboration in infectious disease outbreak preparedness and response worldwide.
- Diverse approaches from various sectors offer valuable insights for developing tailored evaluation methods to assess collaboration in specific public health contexts.

Abstract citation ID: ckae144.138
Autochthonous dengue outbreak in Lombardy, Italy: enhanced surveillance and vector control measures

Giuditta Scardina

G Scardina[1], M Faccini[1], E Rossetti[1], M Bonini[1], M Barozzi[1], M Valenti[1], D Cereda[2], F Rovida[3], F Baldanti[3], S Senatore[1]
[1]Health Protection Agency of the Metropolitan Area of Milan, Milan, Italy
[2]General Directorate of Welfare, Lombardy Region, Milan, Italy
[3]Microbiology and Virology Department, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: gscardina@ats-milano.it

Description of the problem: On 18 August 2023, the first autochthonous case of dengue was registered in Lombardy, in a person living in a village in Lodi province. The case, a man with no history of travels prior to symptoms onset, developed flu-like symptoms on 3 August. After initial suspicion of WNV infection, he was confirmed to have a DENV-1 infection. Following the notification, measures to control the spread of the disease were activated, including alert of healthcare professionals, vector control activities, entomological monitoring and active case finding among household contacts and people living close to the case. Moreover, a serological screening was proposed to population of the entire municipality, along with a survey collecting data about travels abroad and symptoms.

Results: Forty-one confirmed and six probable autochthonous cases were identified. The last case developed symptoms on 20 October. Among confirmed cases, 24 were identified after admission to Emergency Department, 16 through community screening and one at the time of blood donation. 38/41 confirmed cases were symptomatic, with fever, rash and retro-orbital pain being the most common symptoms. Mean age was 55,5 years (3-88), while male: female ratio was 2:1. Hospitalisation was required for 7/41 cases. Community screening was offered from 25 August to 8 October and 416 individuals participated. Among them 10 tested positive for DENV IgG and 27 for DENV IgM (16 were subsequently confirmed as DENV cases, 6 remained probable and 5 were ruled out as non-cases). The primary case of the outbreak was not identified. Vector control activities and entomological monitoring were conducted on 21 August within 200-m radius area around the residence and places visited by index case. Subsequent interventions were conducted in all public areas and sensitive sites of the municipality.

Lessons: Enhancement of surveillance through community screening allowed identification of several additional autochthonous cases.

Key messages:

- Strengthening of surveillance, vector control activities and entomological monitoring is crucial to prevent and control future outbreaks in non-endemic areas with stable presence of Aedes mosquitoes.
- To minimize the risk of introduction and spread of dengue virus in non-endemic areas, it is essential to raise awareness among travellers and general population about preventive and control measures.

Abstract citation ID: ckae144.139
Impact of organisational injustice on health and wellbeing of female police: A meta-ethnography

Mahnoz Illias

M Illias[1], K Riach[2], E Demou[1]
[1]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
[2]Adam Smith Business School, University of Glasgow, Glasgow, UK
Contact: m.illias.1@research.gla.ac.uk

Background: Female police officers face more bias, discriminatory treatment, and insufficient support compared to male officers, resulting in poorer health outcomes. This meta-ethnographic review investigates beyond individual responsibilities to explore the dimensions of policing, and their effects on the health and well-being of female police officers.

Methods: The study reviewed qualitative and mixed-method studies (2000-2022) on the health and well-being of female police officers. Ten databases were searched using keywords related to health, wellbeing, women, police, and qualitative study. Twenty-one papers were synthesised, analysed, and interpreted using a seven-phase inductive and interpretative meta-ethnographic approach.

Results: The data analysis unveiled a distinct outcome, indicating a strong correlation and significant impact of organisational injustice on the health and well-being of women in law enforcement. Our research findings imply that organisational injustice, including procedural, relational, distributive, and gendered injustice, notably affects the health and well-being of female officers, with mental health being frequently cited, followed by effects on social, workplace, and physical health. Furthermore, the consequences of these four types of organisational injustice, alongside related cultural, systemic, and structural risk factors, reach beyond the immediate health and well-being of individual female officers. They also hinder various aspects of their professional lives, such as career advancement and maintaining a healthy work-life balance, potentially exacerbating long-term health and well-being issues.

Conclusions: This review emphasizes addressing organisational injustice and related cultural, systemic, and structural determinants in policing for healthier work environments for female officers. Policy makers must scrutinize gender-neutral policies affecting women, enabling transformative action for safer, supportive, and healthier workplaces.

Key messages:

- Organisational injustice in various forms, significantly impact health and wellbeing of female police officers, necessitating policy reforms.
- Addressing organisational injustice embedded in seemingly gender-neutral policies and practices, is vital for ensuring equitable treatment and health promotion of female police officers.

3.D. Round table: Improving equity in health: Understanding and responding to health literacy as a social determinant

Abstract citation ID: ckae144.140

Organised by: EUPHA-HL, -HP, -GH, -DH, -ETH, IUHPE Working Group on Health Literacy, WHO Action Network on Measuring Population and Organizational Health Literacy, TU Munich (Germany)
Chair persons: Don Nutbeam (Australia), Orkan Okan (EUPHA-HL)
Contact: orkan.okan@tum.de

Evidence of a social gradient in health literacy has been found in all reported national population surveys in Europe. This workshop will examine the explanations for this social gradient and explore ways to optimise the contribution that health literacy makes in mediating the causes and effects of established social determinants of health. This will include consideration of practical approaches to improving health literacy in socially disadvantaged populations as a contribution to reducing health inequities within and across European countries. The workshop will explore the concept of critical health literacy and the potential to improve public awareness of and capacity to act on the wider social determinants of health. It will also draw upon existing evidence from interventions that demonstrate the feasibility of improving health literacy among higher-risk and diverse populations. This will include consideration of approaches to improving frontline professional skills and support; approaches to organizational and systems health literacy, working directly with people to develop critical skills in accessing, understanding and applying health information; and ensuring that in public health policy, priority is proportionate to need - reaching and engaging the population groups disproportionately affected by low health literacy. Recognising that research remains underdeveloped and the effects of interventions on health inequity are largely untested, the workshop will also consider where the most important research gaps exist and where future health literacy research should be prioritised. The workshop chair will provide introductory and summary remarks to the workshop. The co-chair will manage the panel discussion and audience participation in the workshop. The individual panel members will make 3-minute introductions to key issues from different perspectives examining the mediating and moderating role of health literacy in addressing the social determinants of health. The panel is made up of individuals from academic and policy roles and at different career stages who can offer complementary perspectives on these issues. Following the presentations, the co-chair will present some follow-up questions to the panel before engaging directly with the workshop participants for an open discussion scheduled to last for 30 minutes of the workshop.

Key messages:

- Improving health literacy is not a panacea for entrenched inequities in health but can help moderate the impact on health of other social determinants and provide an important practical response.
- Public health policy and practice intended to improve health literacy should prioritise reaching and engaging the population groups disproportionately affected by low health literacy.

3.E. Scientific session: Environmental Health Tracking Systems: a tool for planetary health

Abstract citation ID: ckae144.141

Organised by: EUPHA-HIA, -ENV, -PHMR, International Network on Public Health and Environment Tracking
Chair persons: Piedad Martin-Olmedo (EUPHA-HIA), Peter Van Den Hazel (EUPHA-ENV)
Contact: piedad.martin.easp@juntadeandalucia.es

Planetary health offers a good framework for better understanding the interconnection between human health and environmental changes, promoting effective cross-sector actions and partnerships, and ensuring policy coherence. Effective implementation of this conceptual framework requires monitoring and reporting on indicators relevant to planetary health that capture the scope, spatial and temporal scales of changes in natural systems that affect human health and well-being. An approach in that sense are the environmental public health tracking systems (EPHT), which imply the ongoing collection, integration, analysis, and interpretation of data at the same spatiotemporal scale about environmental hazards, and related human exposure and health effects, maintaining appropriate data protection measures. It aims to provide public-health decision makers with timely, accurate and systematic data for quantifying health impacts related to environmental factors. EPHT system are proposed as an essential tool for designing and monitoring policies and actions that prevent and reduce environmental health burdens (EHB) efficiently and cost-effectively, and as an alerting system against present and future climatic and health crisis. Pursuing such goals requires the use of health information systems that enable the monitoring and assessing of environmental health in multiple dimensions, considering specificities across different geographical and cultural settings. EPHT system requires defining a rationale on how to select the dimensions and indicators to be included. Common challenges for defining those indicators are related to the availability of data recording, data standardization, and the linkage, integration and sharing of databases. In parallel, it is also important to define a decision aiding tools in which evidence and data are understandable and inform about the extent to which specific policy goals are attained, tailoring such tools to the specific settings. Present session attends to answers to those challenges by sharing experiences from different contexts and countries

Key messages:

- EPHT systems represent an effective tool for progressing in achieving planetary health goals and as a surveillance alerting system for future health crisis.
- Adjusting EH data quality recording and analysis in EPHT systems is essential for improving resources assignment, and the effectiveness of healthy policies in reducing EHB.

Abstract citation ID: ckae144.142
The INPHET- a global approach to Environmental Public Health Tracking

Fuyuen Yip

F Yip[1], P Lauriola[2], A Zeka[3], H Crabbe[3], G Leonardi[3]
[1]US Centre for Disease Control and Prevention, Atlanta, USA
[2]International Society Doctors for the Environment, Arezzo, Italy
[3]UK Health Security Agency, London, UK
Contact: fay1@cdc.gov

Environment and health monitoring and information systems are fundamental infrastructure for evidence provision for policy making. The International Network for Public Health and Environment Tracking (INPHET) was formed by a community of environmental public health practitioners to address common interests and activities that advance environmental public health surveillance (EPHS) and data systems, and their uses to inform public health actions. Its main goal is to address the vast inequalities across countries and communities in their ability to monitor, assess, inform and mitigate environmental and health issues. INPHET supports the relevant role of environmental epidemiology as the pillar science providing evidence for decision making and interventions aiming at reducing and preventing environmental related diseases and contributes to an overall vision for public health. As a “Community of Practice”, INPHET focuses on sharing experiences and expertise; addressing common challenges for implementing and enhancing the science of EPHS/tracking; improving understanding of the link between the environment and health; and providing the appropriate evidence that informs public policy. The network, initiated in conference meetings in 2012-13 and formally launched in Modena, Italy in 2014, has carried out several activities which aim at sharing expertise and learning from different models of environmental and health data integration and surveillance systems that directly inform policy. These include Twinning cooperation with Euro-Asian and Balkan countries and sharing of expertise with African Public Health Agencies. Some experiences are presented in this workshop and highlight the EPHS/EPHT model adopted by several national public health agencies. It promotes that such integration and uses of environmental and health data is key for EPHS, including their accessibility and usability for communities of public health researchers, practitioners and policy makers.

Abstract citation ID: ckae144.143
Environmental Public Health Tracking in England- support for Health Impact Assessments

Ariana Zeka

A Zeka[1], H Crabbe[1], G Leonardi[1]
[1]UK Health Security Agency, London, UK
Contact: Ariana.Zeka@ukhsa.gov.uk

Environmental epidemiology is a key function for the public health service with regards to investigating the public health effects of environmental hazards, monitoring the public health efforts to control the environmental risks, and providing the evidence that informs decisions making and preparedness. At the United Kingdom Health Security Agency (UKHSA), the Environmental Public Health Tracking (EPHT) Programme, initiated in 2010, has developed a number of data streams to help link environment and health data, to support Health Impact Assessment (HIA). The main aims of the EPHT programme in England are to:

1. Identify populations at risk from exposure to significant environmental and chemical hazards
2. Investigate relationships between hazard and disease
3. Inform public health policy making
4. Optimise intervention and prevention strategies
5. Generate hypotheses for further research.

Such EPHT functions are based on three key components: a) by building a national EPHT program that integrates surveillance of environmental hazards, exposures and related health outcomes, to allow data linkage and assessment of environmental and health information; b) strengthening the epidemiology science, by conducting research and training of the workforce and c) developing strategies for response to immediate risks, incidents and preparing for future risks. Examples to support HIA include a) developing an air pollution exposure surveillance work programme, that has designed a pilot population vulnerability indicator; b) developing indicators for climate change impacts for public health, c) reporting regularly on the health impacts of public fluoridation water supply schemes (as mandated by Government) and d) exploring risk factors associated with elevated blood lead concentration in children, through laboratory reporting to surveillance systems. The talk will highlight some examples of practice and outline how the EPHT programme in England has supported HIA practices.

Abstract citation ID: ckae144.144
EHT and environmental justice at EPA Victoria: Aspirations and regulatory realities

Timothy Chaston

T Chaston[1], S Mavoa[2], M Dennekamp[3], N Hadgraft[4]
[1]Environment Protection Authority Victoria, Victoria, Australia
[2]The University of Sydney, Murdoch Childrens, Sydney, Australia
[3]Research Institute, Monash University, Victoria, Australia

Contact: Timothy.chaston@epa.vic.gov.au

EPA Victoria (Australia) is a statutory authority that regulates polluting activities and advises other Victorian government departments on relevant policy settings. In 2016, a public health function was installed at EPA Vic to provide emergency health messaging during pollution events, review research evidence of environmental-health relationships and assess industry-contracted health risk assessments of polluting entities. An Environmental Health Tracking Network (EHTN) is under development to support these activities. The EHTN is an agile data and analytical infrastructure for translating expertise across an expanding multidisciplinary network of public health researchers, EPA operational staff and public sector policy makers. Its current interactive dashboards calculate health impacts and associated costs of air pollution scenarios, model land-use influences on land and water contamination and identify coincidences of sociodemographic-, urban environment- and pollution exposure-disadvantage in a high spatial resolution environmental justice (EJ) framework. Regulatory leverage of EHTN intelligence, however, requires legislated EJ thresholds and/or legally tractable costing of industry-externalised human health impacts. Thus, to establish triggers for more stringent conditions on polluting activities and promote equity of interventions and regulations, novel regionally and EJ specific health risk functions are required. Considering these ambitions and challenges, the EHTN at EPA Vic is focussed on 1) identifying and characterising vulnerable populations at high spatial resolution, 2) estimating associated exposure-health effect size modifications using primary epidemiological methods and 3) applying these to health impact and cost assessments of pollution and waste. We seek defensible grounds on which to impose more stringent standards for polluters and redress entrenched social, health and economic disadvantage.

Speakers/Panelists:
Hanna Tolonen
THL, Helsinki, Finland

3.F. Round table: Legal action & capacity building: essential for climate action to protect and promote public health

Abstract citation ID: ckae144.145

Organised by: Aletta Jacobs School of Public Health (Netherlands), ASPHER, EUPHA-ENV, -GH, -HIA, -LAW, Faculty of Public Health (UK), Global Consortium for Climate and Health Education
Chair persons: Laurent Chambaud (France), Mary Codd (Ireland)
Contact: d.w.patterson@rug.nl

The climate crisis is the single biggest threat to global health, peace and security, a crisis multiplier, and a significant driver of health inequalities within and between countries. In many areas of public health policy, legal action and litigation have delivered significant and long-lasting impacts. Court action is a strong domain of legal policy and practice to address climate change and related air pollution in many countries, and increasingly in international courts and tribunals. Examples include the 2021 landmark UK Coroners Report on the asthma-related death of Ella Kissi-Debrah, the 2023 UN General Assembly Request for an Advisory Opinion from the International Court of Justice on states' obligations to address climate change, and the 2024 European Court of Human Rights decision in Klimanseniorinnen v. Switzerland. Climate litigation also creates opportunities for public scrutiny and debate by raising awareness of inaction or harm caused by governments or private sector polluters, generating wider community mobilisation for action. Since 2021, the EUPHA Law and Public Health Section, Faculty of Public Health (UK), Aletta Jacobs School of Public Health, Global Network for Academic Public Health, ASPHER and other partners have collaborated to build ethicolegal competence and capacity of public health professionals for climate action. Initiatives have also included research, advocacy, and resource development, and exploring opportunities for legal action and litigation, including at the International Conference on Strategic Litigation and Public Health (Liverpool, 2023). The roundtable will present key findings from an evaluation of the course on climate change organised by the ASPHER and the Global Consortium on Health and Climate Education (GCHCE), and learnings and feedback from the publication 'From analysis to action: climate change litigation. A guide for public health professionals', which was launched at the 16th European Public Health Conference. The expert panel will also reflect on whether the nature of current educational materials, means and methods in curriculum and training initiatives are effective, appropriate, adequate, and sufficient. Should climate change be part of One Health and Planetary Health programmes rather than a distinct entity? What is the role of, and what are the opportunities for, public health professionals to be engaged in climate litigation? What are the gaps and opportunities through strategic networking with environmental and legal experts, and affected communities? The roundtable will be interactive and invite input and insights from the participants to explore opportunities to further advance the agenda.

Key messages:

- Public health professionals have a key and increasing role in climate law and litigation: interdisciplinary collaboration is essential.
- Public health professionals have multiple avenues for capacity building on opportunities to address climate and environmental impacts on public health through law.

3.G. Scientific session: Making WHO European Region the Healthiest Online Environment for children: Restrict harmful marketing

Abstract citation ID: ckae144.146

Organised by: WHO/Europe, EUPHA, Joint Action Prevent Non-Communicable Diseases and Cancer
Chair persons: Kremlin Wickramasinghe (Denmark), Amandine Garde (EUPHA-LAW)
Contact: wickramasinghek@who.int

Children spend a significant amount of their time daily on digital devices using online services. While this can bring many advantages and benefits, it also entails dangers if not the online environment is not effectively regulated. Exposure to marketing of harmful products and services, particularly towards children, remains a pervasive challenge, despite the extensive evidence base documenting its negative impacts. This session will give an overview of integrating behavioural sciences with public health which suggested promising avenues for addressing the complexities of harmful digital marketing to children. Additionally, current tools developed by WHO Regional Office for Europe and Joint Actions, which Member States can use to address novel challenges like brand marketing will be presented. The tools help to map, monitor and regulate the digital marketing exposure of unhealthy foods and brands to children in their country. One focus will be on the need to objective monitoring of marketing exposure to inform policies and ensure that they are fit for purpose.

This is particularly challenging, as traditional monitoring tools struggle to keep up with automated, targeted and personalized advertisements. Due to the complexity to successfully restrict marketing exposure to children, strong collaborations are needed. Collaborative efforts of the Joint Action PreventNCD and the WHO Europe will be presented. Specific goals set by the Joint Action, as well as the importance of a sustainable approach will be highlighted. A discussion on the way forward will focus on how tangible impact can be created in the WHO European Region.

Key messages:

- Need for effective tools to address novel challenges and successfully monitor and regulate harmful marketing to children.
- Need for integration of behavioural science and strong collaborations to create real impact.

Abstract citation ID: ckae144.147
Innovative tools from WHO Europe to protect children from digital marketing of unhealthy products

Olga Zhiteneva

O Zhiteneva[1], K Hetz[1]
[1]Special Initiative on NCDs and Innovation, WHO/Europe, Copenhagen, Denmark
Contact: zhitenevao@who.int

Children in the WHO European Region are extensively exposed to marketing of unhealthy products, including tobacco, alcohol, HFSS foods, and gambling, which negatively influences their dietary choices, behaviors, and perceptions of a norm, threatening their health rights. Recognizing the urgency to protect children's developmental potential and rights, WHO has actively addressed this issue both within Europe and globally. In 2010, WHO issued recommendations for Member States on marketing foods and beverages to children. Building on these efforts, the CLICK framework for monitoring digital marketing to children was introduced in 2018. In 2023, WHO released guidelines urging countries to adopt comprehensive, mandatory policies to protect children from HFSS food marketing. Despite political commitments and policies, children and adolescents continue to be exposed to unhealthy product marketing, increasing their risk of NCDs as online activity rises. At the same time, while efforts have focused on restricting specific products, rapid changes in digital marketing strategies necessitate broader measures. Emerging trends include promoting brand loyalty among young children through brand characters and logos. Tools and support are urgently needed to monitor and implement WHO recommendations in online settings, including brand marketing. Despite WHO recommendations, few countries have implemented mandatory policies. Reliable monitoring mechanisms are essential. To address this gap, the WHO Regional Office for Europe developed the KidAd platform to monitor children's exposure to digital advertising.

Contact: mariajoaobg@dgs.min-saude.pt

Control and counter the effects of advertisements and online marketing is one of the policy actions that will be explored within the JA Prevent NCD that has the overall aim to "reduce the burden of cancer and other NCDs and common risk factors, both at a personal and societal level, and support member states by taking a holistic approach for the prevention of cancer and other NCDs, through coordinated action". The work that will be building on the JA Best-ReMaP sustainability framework recommendations to improve the effective implementation of policies to reduce harmful marketing of unhealthy food, would at the same time comprehensively address also tobacco and alcohol maketing. Thirteen different countries are involved in the work package on regulation and taxation that has the overall objective to "improve compliance, coherence, wider implementation and enforcement of fiscal and regulative measures targeting major NCD-risks factors." This includes a broad range of tasks from mapping existing policies and frameworks, accumulating knowledge on health taxes and fiscal policies, promoting the use of joint nutrient profile models, assessing the impact of labelling on products to create healthier behaviors, supporting the implementation of policies to reduce the impact of harmful marketing, strengthening regulations towards hazardous substances and developing monitoring indicators for policies for prevention of NCD. An overview of the concrete collaborative actions to support the implementation of the marketing regulation will be given: (1) on JA work with the MSs and especially presidency countries, to allow for the discussions on the development of the EU regulation for reduction of the harmful marketing; (2) on the EU stakeholders positions regarding marketing regulation; (3) on the collaborative actions in scaling up the KidAd app. (5) the development of an algorithm to detect alcohol, tobacco and nicotine-containing products will be jointly developed and piloted.

Leveraging Behavioural Insights to Create Healthier Online Environment for Children

Iveta Nagyova

I Nagyova[1,2]
[1]Department of Social and Behavioral Medicine, PJ Safarik University, Kosice, Slovakia
[2]EUPHA
Contact: ivanagy@gmail.com

Issue/Problem: The proliferation of digital marketing poses a significant threat to children's health and well-being, necessitating innovative solutions grounded in cross-disciplinary systems approach.
Description of the problem: Children's exposure to harmful digital marketing is pervasive, influencing their preferences, behaviours, and health outcomes. Traditional regulatory approaches often fall short in addressing the dynamic nature of online advertising, exacerbating the challenge. Without effective interventions, children remain vulnerable to the detrimental effects of marketing for unhealthy products and services, undermining public health efforts.
Results: Integrating behavioural sciences with public health suggests promising avenues for addressing the complexities of harmful digital marketing to children. The WHO KidAd app is a ground-breaking tool designed for objective monitoring of digital marketing. Coupled with evidence-based behavioural strategies such as nudges, choice architecture, and social norms, policymakers can influence decision-making in favour of healthier choices, thereby reducing the impact of harmful marketing. By understanding the decision-making processes and behavioural patterns involved, policymakers can design targeted interventions to mitigate exposure and protect children.
Lessons Learned: The application of behavioural sciences in public health policy-making yields valuable lessons. Firstly, personalized and contextually relevant interventions resonate more effectively with target audiences, enhancing their efficacy. Secondly, leveraging behavioural insights allows for the design of interventions that complement existing regulatory frameworks, filling gaps in enforcement

and compliance. Thirdly, interdisciplinary collaboration between public health experts, policymakers, and behavioural scientists is essential for developing evidence-based strategies tailored to the digital landscape's evolving challenges. [Grant: APVV-22-0587]

3.H. Scientific session: Advancing Health and Care System Transformation with the THCS Partnership

Abstract citation ID: ckae144.150

Organised by: European Partnership on Transforming Health and Care Systems, EUPHA-HSR, -HTA
Chair persons: Ilmo Keskimäki (Finland), Chiara de Waure (EUPHA-HTA)
Contact: ilmo.keskimaki@thl.fi

Health and care systems across Europe are facing similar challenges. These include demographic and epidemiological changes, such as growing ageing population and increasing incidence and prevalence of chronic diseases, in addition to diminishing of budgets. These challenges can be met by innovative, evidence-based solutions, the research and development of which can be supported by several ways. The European Partnership on Transforming Health and Care Systems (THCS) is a co-fund action within the Horizon Europe Programme which supports coordinated national and regional research and innovation programs, alongside capacity building, networking, dissemination, and other activities crucial for health and care systems' transformation. The core of THCS's activities lies in funding research and innovation projects through transnational calls, engaging numerous research and innovation funding organisations. In addition to the funding activities, THCS develops several means for supporting the transformation towards sustainable, efficient, resilient, inclusive, innovative, and people-centred health and care systems accessible to all. This workshop aims at discussing on the trends and needs for research, development and innovation and capacity building in the European health and care systems, on leveraging research outcomes for evidence-based strategies and translating research into practice, on transferring and implementing innovative health and care practices, on fostering ecosystems, and on facilitating knowledge exchange and sharing. In the workshop the different means of the THCS partnership to support the transformation of health and care systems are presented and their further development discussed. The workshop consists of five presentations followed by a general discussion.

Key messages:

- Participants will learn about the different means of the THCS partnership to support the transformation of health and care systems.
- Participants can contribute to the further development of the THCS activities by sharing their reflections, opinions, and viewpoints.

Abstract citation ID: ckae144.151
Reviewing and assessing emerging trends and needs for research, development and innovation (RDI) and capacity building in a short, medium and long-term perspective

Ruth Baron

R Baron[1], J Hansen[1]
[1]NIVEL, Utrecht, Netherlands
Contact: r.baron@nivel.nl

An important aim of the Partnership is to identify current and future health services and systems priorities and to identify capacity building and training needs to support RDI activities in health and care systems in the Partnership countries and the EU as a whole. This is being done by means of periodical reviews, among others building on scientific research literature, strategic and policy documents and consultations of stakeholders. At the conference workshop, results of the mapping are presented, with a special focus on priority areas that can contribute to health systems transformation towards sustainable and people-centred health and care systems accessible to all. The session will allow participants provide reflections on and refinements to potential common priorities across national RDI agendas. This will provide direction for future research calls, based on an inventory of priorities that are considered by both policy audiences, research and wider stakeholder communities that should be addressed at EU and national levels.

Abstract citation ID: ckae144.152
Enhancing policy impact: Bridging evidence to action

Cécile Fragny

C Fragny[2], V Delattre[1], M Samoila[2], A Stefan[2], L Da-Cruz[1], I Cucu[2], S Lazar[2], A Rus[2], M Ungureanu[2]
[1]Research and Innovation Department, Direction Générale de l'offre de Soins, Paris, France
[2]Faculty of Political, Administrative and Communication Sciences, Babeș-Bolyai University, Cluj-Napoca, Romania
Contact: cecile.fragny@sante.gouv.fr

The aim of the THCS partnership, regarding bridging evidence to policy, is to develop evidence-based cooperation strategies that enable policymakers in partner countries to base their decisions on validated and reliable knowledge. This approach aims to drive meaningful transformation in our health and care systems collectively. Facilitating knowledge exchange and mutual learning among policymakers is key to achieving this goal. THCS seeks to foster the sharing of experiences, best practices, and lessons learned, and ultimately design tailored tools to ensure policymakers are aware of existing resources and opportunities for effective policy development. During the workshop, the presentation, discussions, and activities will focus on two main issues: identifying who should be considered a policymaker and determining the necessary tools to develop evidence-based strategies. Participants are encouraged to explore how evidence-based strategies can be translated into policy actions and integrated into practice at various levels of the health system, from local to national and European levels.

Abstract citation ID: ckae144.153
Facilitating the transfer and implementation of practices across health and care systems

Juha Koivisto

J Koivisto[1], H Muurinen[1]
[1]Knowledge Management and Co-Creation, THL, Helsinki, Finland
Contact: juha.koivisto@thl.fi

The THCS partnership has developed the initial draft of a framework designed to facilitate the transfer and implementation of solutions across health and care systems. During the workshop, we will present this framework along with the preliminary results of its real-world testing in transfer and implementation activities. The goal of this presentation is to gather feedback on the framework and generate ideas for its further development. Choosing to transfer existing solutions rather than developing new ones can offer several advantages in terms of efficiency, reliability, and cost-effectiveness. Adopting existing solutions can save time and reduce development costs significantly. The THCS framework aims to support, promote, and accelerate the transfer and implementation of solutions across health and care systems. The THCS framework is primarily targeted at individuals involved in planning, coordinating, and executing development activities within health and care organizations. This framework includes: 1) Paradigmatic commitments that underpin its understanding of development activities, transferability, and implementation; 2) Principles for conducting the activities of transferring and adapting solutions developed elsewhere; 3) Guidelines for describing original solutions; and 4) Key development tasks that outline the necessary steps for transferring, adapting, and implementing solutions developed elsewhere.

Abstract citation ID: ckae144.154
Strengthening ecosystems

Juha Teperi

G Geyer[1], *J Teperi*[2]
[1]FFG Austrian Research Promotion Agency, Vienna, Austria
[2]Tampere Institute for Advanced Study, Tampere University, Tampere, Finland
Contact: juha.teperi@tuni.fi

The mission of THCS activities with respect to strengthening ecosystems is based on the understanding that the actual transformation of health and care systems is dependent on the ability of numerous actors to align their goals and actions so that they are complementary. At the same time, it is also true that the transformation takes place at national, regional and local levels, making activities and support at these levels essential for the success of THCS. Therefore, the focus lies on connecting and supporting the broad community and other stakeholders in developing ecosystem-wide approaches and creating awareness and urgency among ecosystem layers and components, thus serving as a platform for transformation. One strand of activities for strengthening ecosystems aims at identifying, analysing, describing and disseminating key learnings from successful transformative ecosystems (TE's). TE's are broad constellations of interacting organisations and people who are committed, and through aligned actions, able to reach joint, explicitly defined goals in long-term. Making not only the most successful TE's but also the dynamics explaining their achievements visible, value is being added through three main routes. Firstly, the experiences are distributed widely on European arenas and platforms as well as through national, regional and local channels to inspire ecosystem building processes in earlier stages of maturity. Secondly, collaboration between identified forerunner ecosystems is supported to enable mutual peer-learning. Thirdly, the examples are used to give guidance and inspiration to consortia that are applying for or receiving THCS project funding. As strategic partners of the ecosystem strengthening activities, other work packages of the THCS programme as well as the THCS National Mirror Groups are of great importance.

Abstract citation ID: ckae144.155
Enabling effective knowledge sharing through a Knowledge Hub

Andrea Pavlickova

A Pavlickova[1], *D Henderson*[1]
[1]Digital Health and Care Directorate, Scottish Government, Edinburgh, UK
Contact: Andrea.Pavlickova@nhs.scot

The objective of the THCS Knowledge Hub is to facilitate and implement effective knowledge sharing and capacity-building activities for the transformation of health and social care systems in Europe, tailored to the users' needs and local context in order to prepare the ground for the transformation of health and social care systems. The Hub acts as personalised and interactive "matchmaking" platform which will allow the potential users to (a) access, provide and search for personalised and tailored resources generated in the THCS community but also beyond, reflecting the local maturity and conditions enabling the transformation of health and social care systems; (b) facilitate a support for the potential adaptation and transferability of these resources across the European health and social care settings through the functional use of THCS Innovation Transferability Framework; (c) enable the policy dialogue and capacity-building support for policy-makers in order to enhance their skills, knowledge and experience in health and social care transformation; (d) access and engage with THCS community of experts and ecosystems in order to maximise the access and use of the exiting knowledge and expertise for the transformation of health and social care systems; (e) signpost to existing evidence and resources related to health and social care transformation to enable effective knowledge sharing (educational webinars, peer review activities, study visits, training workshops), exchange of good practices and experience in transforming health and social care systems.

3.I. Scientific session: Increasing EU preparedness and improving European Vaccination Beyond COVID-19: the EUVABECO approach

Abstract citation ID: ckae144.156

Organised by: University of Crete (Greece), Riga Stradiņš University (Latvia), Sciensano (Belgium), EUPHA-IDC, -GH, EC HaDEA
Chair persons: Elena Petelos (EUPHA-HTA, EUPHA-GH), Georgios Margetidis (Luxembourg)
Contact: elena.petelos@med.uoc.gr

This workshop provides a platform for delegates to enhance their understanding of the interdisciplinary approach developed in the European Vaccination Beyond COVID-19 (EUVABECO) project, funded under the European Commission's EU4Health programme. The project is to build and validate implementation plans for EU Member States (MS) to equip them with operational and technical tools to enhance vaccination practices both in routine vaccination and in case of future outbreaks. Validation will be based on innovative practices that emerged in the context of the COVID-19 pandemic. Ultimately, EUVABECO will provide MS with robust implementation plans for common tools to support said innovative vaccination practices, thus, enhancing preparedness and increasing resilience against future health threats in Europe and globally. Guided by two chairs, the workshop is structured around five brief interactive presentations to deliver the conceptualisation, methodologies, and early results and vision for vaccination beyond COVID-19. It is designed to highlight how project activities strengthen resilience and increase preparedness against communicable diseases across the EU and beyond its borders, whilst brokering dialogue on related public health priorities. The presentations will focus on:

1. Preparing for future public health crises by fostering a conducive environment.
2. Enhancing preparedness by developing robust implementation plans.
3. An interdisciplinary approach: Exploring the five dimensions (medical/clinical, social, industrial, modelling and forecasting, and digital) of the tools deployed by EUVABECO.
4. The vital role of stakeholders and of the National Immunization Technical Advisory Groups (NITAGs).
5. Future actions and a call for ongoing support and collaboration in a structured manner.

The session will also give the opportunity to formally present EUVABECO's multistakeholder approach and to formally launch the EU Vaccination Stakeholder Forum, where early access will be granted to EU MS for the various resources generate. This will allow the audience to give input about the needs of the broader public health community involved in vaccination across the EU, for the Stakeholder Forum to effectively promote and support:

- The scaling up of existing implementation plans within MS;
- The development of new implementation plans for additional tools;
- Integration between public health and primary care;
- Inform the targeted interaction with EU and MS bodies involved in related policies and decision-making.

The presentations will be augmented by real-time polling to maximize participant engagement. This approach will maximize interaction whilst eliciting critical insights into stakeholders' knowledge, attitudes, and practices concerning EUVABECO's tools and strategies. This type of engagement will ensure effective knowledge transfer and a comprehensive understanding of the project's objectives and implementation strategies.

Key messages:

- Enhancing vaccination preparedness requires an evidence-based and harmonized set of tools to be deployed across EU MS. EUVABECO will deliver validated implementation plans to achieve this.
- An interdisciplinary approach and multistakeholder engagement are critical for evidence-informed decision-making and harmonization to successfully deploy vaccination initiatives across the EU.

Contact: lionis@uoc.gr

Vaccination is considered one of the most cost-effective public health interventions. Zoonotic diseases, which are transmitted from animals to humans, represent an escalating global health concern. Environmental degradation, wildlife trade, and intensified farming practices have disrupted natural ecosystems. This has not only heightened the risk of pathogens crossing species barriers but exacerbated the migrant crisis and deepened global inequalities, as vulnerable populations disproportionally bear the environmental and health burdens. Despite decades of awareness about these risks, the COVID-19 pandemic highlighted our lack of preparedness. At the same time, vaccination hesitancy has been revealed as an important factor in implementing universal vaccination coverage at the population level. Urgency drove innovation. Within months, new multidisciplinary and interdisciplinary approaches were implemented that enhanced our capacity to understand, treat, and protect against the virus. This led to deploying novel technologies, curbing the crisis, and even opening the door to emerging health technologies across a wide spectrum of innovation, from new medicinal products, including vaccines, to evidence synthesis tools, including for modelling and forecasting. Shifting from emergency measures to long-term management of COVID-19, there lies a critical opportunity to strengthen resilience and to increase preparedness against future health threats. The EUVABECO project seeks to harness this momentum by initiating pilot projects that test innovative vaccination tools in evidence-based selected reference practices. These pilots are planned to use suitable theoretical frameworks and consensus meetings to design and develop comprehensive implementation plans that will be shared with EU MS, thereby enhancing Europe's preparedness and response capabilities against communicable diseases.

Abstract citation ID: ckae144.158
Enhancing preparedness by developing robust implementation

François Kaag

F Kaag[1], JF Koeck[1]
[1]Syadem, Bordeaux, France
Contact: fkaag@mesvaccins.net

In EUVABECO, a goal is defined as a public health objective that motivates a vaccination practice. A vaccination practice encompasses specific methods or approaches used in vaccination efforts, while a tool refers to a tangible resource or software developed to support the implementation of these practices. EUVABECO is undertaking a series of structured activities from January 2024 until mid-2026. These include mapping innovative practices, deriving requirements for tools and validation plans, developing implementation plans, and facilitating their adoption by European MS. The project will also evaluate, validate, and verify these plans to ensure their efficacy and sustainability. EUVABECO's methodology is informed by the Systems Development Lifecycle (SDLC) framework, utilizing the V-model to ensure a strong linkage between the development and testing phases, thereby guaranteeing a cohesive workflow. Each implementation plan developed will feature comprehensive policy recommendations and a workplan that covers the necessary organizational, technical, legal, and ethical aspects required for the tool's deployment. Additionally, these plans will include tailored strategies to enhance the tool's functionality during outbreaks, criteria for verifying implementation effectiveness, and financial considerations critical for supporting adoption. The implementation plans will undergo a rigorous validation process to assess their suitability, transferability, and sustainability across MS. The ultimate goal is to disseminate validated plans whilst ensuring a parallel multistakeholder engagement approach to ensure MS are actively involved in key project phases, thus, facilitating rapid uptake of said plans across EU MS and a transformation of the vaccination ecosystem across Europe.

Abstract citation ID: ckae144.159
An interdisciplinary approach: Exploring the five dimensions of the tools deployed by EUVABECO

Matthieu Billuart

M Billuart[1], J Van Loenhout[1], L Nasiadka[1]
[1]Sciensano, Brussels, Belgium
Contact: Matthieu.Billuart@sciensano.be

To effectively address the complexities of vaccination across the EU, EUVABECO's 14 partners are implementing a comprehensive, interdisciplinary approach. Twelve pilot projects will be implemented from September 2024 to August 2025 in six MS (BE, DE, EL, LV, LU, PL, PT). These pilots will test innovative tools across five domains-medical, social, industrial, modelling and forecasting, and digital-to optimize vaccination outcomes:
Medical/Clinical Tool: A decision support system that aids patients and healthcare professionals by providing current, evidence-based information tailored to individuals, thereby facilitating informed vaccination decisions.
Social Tool: Data linkage on an individual level, to enhance the targeting and monitoring of vaccine campaigns, and ensuring equitable access to vaccines, especially for vulnerable populations.
Industrial Tool: An electronic vaccine leaflet that boosts the flexibility and responsiveness of vaccine distribution by offering dynamic, real-time information in local languages to both healthcare providers and patients - regardless of the source and point of use of the vaccine.
Modelling and Forecasting Tool: A disease simulator that models infection dynamics and evaluates the impact of public health interventions, crucial for strategic planning and resource allocation.
Digital Tool: A citizen-held digital vaccination card that enables individuals to maintain a comprehensive, accessible record of their own vaccination histories, enhancing continuity of care across borders.

Abstract citation ID: ckae144.160
The vital role of stakeholders and National Immunization Technical Advisory Groups (NITAGs)

Dace Zavadska

D Zavadska[1], *K Ozolina*[1]
[1]Department of Paediatrics, Institute of PH, Riga Stradins University, Riga, Latvia
Contact: Dace.Zavadska@rsu.lv

To successfully implement comprehensive, multidisciplinary and interdisciplinary approaches, collaborative, cross-sectoral policy and strategies are essential. This is critical not only for addressing shared challenges but also for developing effective intervention strategies. One of the main hurdles in any collective action initiative is the ability to galvanize diverse stakeholders, each with their unique set of interests and capacity. EUVABECO is dedicated to conducting pilots, and developing implementation plans that are not only effective but also adaptable and sustainable across various healthcare settings in Europe. The healthcare environments across the pilot countries exhibit considerable variability, including differences in epidemiological trends, immunization information systems, vaccine nomenclature, and the dynamics of collaboration with National Immunization Technical Advisory Groups (NITAGs). Throughout implementation, the cooperation between these diverse stakeholders and NITAGs will be crucial, notably to share local vaccination policies for integration into the Clinical Decision Support (CDS) system. EUVABECO's goal is to craft implementation plans that are flexible enough to be tailored to local needs, ensuring that interventions are both practical and effective in each unique context. This presentation will explore the vital role that stakeholders and NITAGs play in this process, highlighting the importance of their involvement for the success of EUVABECO's initiatives.

Abstract citation ID: ckae144.161
Future actions and a call for ongoing support

Sibilia Quilici

S Quilici[1], *A Czwarno*[1]
[1]Vaccines Europe, EFPIA, Brussels, Belgium
Contact: sibilia.quilici@vaccineseurope.eu

The EUVABECO project is currently piloting a suite of innovative tools, including decision support systems, targeted screening tools, electronic vaccine leaflets, disease simulators, and cross-border vaccination cards. These tools have shown great promise in transforming vaccination practices within individual healthcare settings, contributing to building vaccine confidence and increasing protection against vaccine-preventable infections across the life course. As EUVABECO progresses to the crucial phase of implementing these pilots, active collaboration and sustained support from the multiple actors of the vaccine ecosystem in the implementing countries are essential. To ensure these tools are effectively adapted across different MS, they must be customised to meet local needs and the specific requirements of diverse healthcare environments. This involves integrating feedback from initial deployments. More than just a technical implementation, this phase is about fostering and maintaining robust partnerships with key stakeholders such as healthcare providers, policymakers, and National Immunization Technical Advisory Groups (NITAGs). The success of the EUVABECO project depends on continuous engagement and the sharing of knowledge and resources among all partners involved. This presentation seeks to reinforce the call for ongoing commitment and collaboration from existing stakeholders and to encourage new partners to join this transformative effort. This will foster a more harmonized approach to vaccination policies. Together, we aim to build a more resilient public health infrastructure, enhancing the preparedness and responsiveness to current and future vaccination challenges, ultimately improving resilience to health threats across the European Union.

3.K. Oral presentations: Digital health literacy

Abstract citation ID: ckae144.162
Health literacy in the evolving era of personalised medicine and digital health

Flavia Beccia

F Beccia[1], *FA Causio*[1], *M Porcelli*[1], *L Proto*[1], *C Van El*[2], *GE Calabrò*[1], *R Pastorino*[1], *S Boccia*[1]
[1]Department of Life Science and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Department of Human Genetics, Amsterdam UMC, Amsterdam, Netherlands
Contact: flavia.beccia01@icatt.it

Health literacy is pivotal for advancing public health, empowering individuals to grasp health information and make informed decisions. However, health literacy levels are often influenced by social and economic factors, with lower levels correlating with reduced disease-specific knowledge and underutilization of preventive health services. As healthcare technology rapidly evolves, particularly with the advent of personalised medicine (PM) and novel genetic testing methods, there's an increasing demand for heightened health literacy to effectively navigate these transformative innovations and optimize health outcomes. The European ExACT project aims to assess the understanding of PM and related technologies across the EU. In this context, through a survey conducted in several European countries, including Italy, France, Spain, Poland, the Netherlands, Romania, Hungary, and Germany, demographic data and attitudes towards PM, genetic testing, health portals, and big data were gathered. Logistic regression analysis identified factors influencing knowledge and attitudes. Among 6581 respondents, the results highlight a broad awareness of genetic testing (81%) and health portals (54%) yet a lesser familiarity with PM (48%) and big data (37%). Education level, age, and gender influenced awareness, with Hungary showing significant awareness across all topics (OR 2.09 95%CI 1.46-2.98), Spain excelling in big data (OR 1.88 95%CI 1.55-2.27), and Poland leading in genetic testing knowledge (OR 2.68 95%CI 1.82-3.96). Differences between countries may indicate successful policies and factors that can be replicated. Overall, the study emphasizes the importance of enhancing health literacy and sheds light on the predicting role of sociodemographic factors. It underscores the significance of bolstering health literacy to effectively navigate the advancements in PM and digital health, improving health outcomes in light of these evolving healthcare landscapes.

Key messages:

- In Europe, awareness of personalised medicine, health portals and big data is lacking. Educational initiatives are crucial for effective navigation of innovations, considering regional differences.
- Social and economic factors affect health literacy levels, impacting disease-specific knowledge and healthcare utilization.

Abstract citation ID: ckae144.163
Marketing Harm to Children: Children's exposure to unhealthy commodity marketing using body cameras

Louise Signal

L Signal[1], *T Worters*[1], *C McKerchar*[1]
[1]Health Promotion & Policy Research Unit, University of Otago, Wellington, New Zealand
Contact: louise.signal@otago.ac.nz

Background: Sophisticated, persuasive and extensive product marketing is a key driver of unhealthy commodity (UHC) consumption. This study aims to identify the nature and extent of children's exposure to UHC marketing.

Methods: The study is a secondary analysis of Kids'Cam, a cross-sectional study in which 168 New Zealand 12-year-old children wore body cameras that automatically captured images of their environment every 7 seconds over four days. Images were analysed for exposure to UHC, Healthy and 'Other' marketing.

Results: Children were exposed to UHC marketing on average 76.2 times/day, nearly 2.5 times their daily exposure to 'Healthy' marketing. Exposure included: unhealthy food marketing (68.4/day), alcohol (5.7/day), gambling (2.1/day) and tobacco marketing (0.1/day). These exposure rates align with the level of statutory regulation each UHC faces in NZ. Food outlets were the most common setting for UHC marketing exposures, while product packaging was the most common medium. Coca-Cola (6.3/day) was the most common UHC exposure, followed by Cadbury, Tip Top, Bluebird and Powerade. Over half of children's unhealthy food (54.9%) and alcohol (51.9%) marketing exposures were attributed to multinational corporations. In contrast, statutory bodies are responsible for almost all (97.4%) of children's gambling marketing exposure.

Conclusions: Children currently grow up in an environment in which they are constantly persuaded to consume products that directly harm their health - an environment in which the profits of corporations are favoured over public health. Statutory regulation of UHC marketing is urgently needed to protect children from harm.

Key messages:

- Children were exposed to unhealthy commodity marketing on average 76.2 times/day, nearly 2.5 times their daily exposure to 'healthy' marketing.
- Statutory regulation of unhealthy commodity marketing is urgently needed to protect children from harm.

Abstract citation ID: ckae144.164
Associations between bedtime media use and sleep outcomes in an adult population-based cohort

Stephanie Schrempft

S Schrempft[1], *H Baysson*[1,2], *A Chessa*[1], *E Lorthe*[1,3], *M-E Zaballa*[1], *S Stringhini*[1,4,5], *I Guessous*[2,6], *M Nehme*[1]
[1]Unit of Population Epidemiology, Geneva University Hospitals, Geneva, Switzerland
[2]Department of Health and Community Medicine, University of Geneva, Geneva, Switzerland
[3]Inserm, Université Paris Cité, Paris, France
[4]Unisanté, University of Lausanne, Lausanne, Switzerland
[5]School of Population and Public Health, University of British Columbia, Vancouver, Canada
[6]Division of Primary Care Medicine, Geneva University Hospitals, Geneva, Switzerland
Contact: stephanie.schrempft@hug.ch

Background: We aimed to extend existing research on associations between bedtime media use and sleep in adults by taking relevant covariates into account and testing hypothesised mediating and moderating pathways.

Methods: Frequency of bedtime media use and sleep outcomes were examined by questionnaire in 4188 adults (59% women, aged 19-94 years) from the Specchio cohort in Geneva, Switzerland. We tested: 1) associations between bedtime media use and sleep (bedtimes, sleep latency, sleep duration, sleep quality, insomnia symptoms, and daytime sleepiness), adjusting for prior sleep, mental health, and health behaviours (physical activity, binge drinking, smoking, total leisure screen time), 2) whether bedtime media use mediates associations between individual susceptibility factors (age, chronotype, and mental health) and sleep, and 3) whether individual susceptibility factors moderate associations between bedtime media use and sleep.

Results: Often using a screen in the 30 minutes before going to sleep at night was associated with a late bedtime (≥midnight; OR [95% CI]=1.90 [1.44, 2.51], $p < 0.001$), short sleep duration (<7 hours; 1.21 [1.01, 1.46], $p < 0.05$), and excessive daytime sleepiness (Epworth score >9; 1.47 [1.25, 1.74], $p < 0.001$) after adjustment for all covariates. Bedtime media use partly mediated the association between younger age and an evening chronotype and these sleep outcomes. Mental health moderated the association between bedtime media use and sleep quality/insomnia, such that the former was associated with poorer sleep quality/insomnia among individuals with better mental health, but not among those with poorer mental health.

Conclusions: Frequent bedtime media use was associated with various sleep outcomes, independently of relevant covariates. Limiting the use of screens at bedtime is important to promote sleep among adults. Individuals with poorer mental health likely require additional support to improve their sleep quality.

Key messages:

- Frequent bedtime media use is associated with a late bedtime, short sleep duration, and more daytime sleepiness in adults, and these associations hold after adjustment for relevant covariates.
- Frequent bedtime media use mediates the association between individual susceptibility factors and sleep outcomes. Mental health moderates the association between bedtime media use and sleep quality.

Abstract citation ID: ckae144.165
The higher education's role in the multisectoral evolution of the diabetes mobile unit programme

Danah Smith

D Smith[1]
[1]School of Nursing and Midwifery, RCSI, Medical University of Bahrain, Adliya, Bahrain
Contact: dsmith@rcsi.com

Background: The global prevalence of obesity and diabetes is increasing. Overweight and obesity during early childhood increase the risk of developing type 2 diabetes. The diabetes mobile unit (DMU) programme is a collaborative initiative between the Bahrain Diabetes Society, the Royal College of Surgeons in Ireland (RCSI) Medical University of Bahrain, the Ministry of Education, and other stakeholders.

Objectives: To develop a sustainable educational programme to empower nursing and medical students to educate schoolchildren on healthy lifestyle choices and potentially reduce the risk of obesity and type 2 diabetes.

Results: The DMU programme is incorporated into the undergraduate nursing and medical curricula. It fosters experiential learning in public health education and promotion, encourages trainee-trainer mentorship, and cultivates essential graduate skills, thus enhancing their career prospects. Since 2012, the programme inducted 300 staff and students and educated 7,000 children. In 2023, the programme was re-launched in alignment with RCSI's three strategic pillars: learning and teaching, research, and community engagement. The programme expanded its stakeholders' network and incorporated strategies to promote interprofessional learning among staff, students, and alumni. The outcome of these endeavours included publishing an interactive storybook, creating innovative educational tools, and ongoing research.

Conclusions: This novel programme highlights the role of higher education in promoting multisectoral collaboration for public health awareness initiatives. The key to the programme's success is synchronizing education, research and community engagement in higher education curricula and various contexts.

Key messages:

- Multisectoral collaboration is essential in developing evidence-based and culturally congruent programmes.
- Linking education, research, and community is vital to achieving sustainable development goals.

Abstract citation ID: ckae144.166
Data literacy in healthcare: A systematic collection and evaluation of OERs on data acquisition

Christian Kempny

C Kempny[1]*, D Wahidie*[1]*, I Dereli*[1]*, Y Yilmaz-Aslan*[1]*, P Brzoska*[1]
[1]Witten/Herdecke University, Faculty of Health, School of Medicine, Health Services Research, Witten/Herdecke, Germany
Contact: christian.kempny@uni-wh.de

Background: Data literacy is crucial in healthcare, as it allows healthcare professionals to recognize, collect, and use data for research efficiently. Teachers can use open educational resources (OERs) to increase data literacy among healthcare staff, covering the entire research process. This study focuses on examining existing OERs with a focus on data acquisition to identify the limitations of existing OERs and to develop new OERs for data collection based on these limitations.

Methods: The platforms 'Twillo.de', 'Orca.nrw', 'Merlot.org', 'OER Commons', 'Serlo', 'VIMEO', 'Dailymotion', 'SlideShare' and 'YouTube' were systematically searched for OERs focusing on quantitative and qualitative data acquisition. Only OERs published under a Creative Commons license were considered. A team of researchers then analyzed existing OERs with respect to production and content quality and sorted them into four competence levels of a learning objective matrix developed by Schüller (2020).

Results: Out of 4,383 search results, we identified 111 suitable OERs for qualitative data acquisition. Only 9 of these were related to health. For quantitative data acquisition, out of 4,415 search results, 145 suitable OERs were identified, 36 of which were health-related.

Conclusions: This study highlights the scarcity of suitable OERs for healthcare professionals to improve their health data literacy. This is for various reasons. Only a few OERs are specifically designed for healthcare professionals and, therefore, do not correspond to the lifeworld of learners in the explanatory examples. Additionally, the existing OERs are not sufficiently detailed in essential areas for learners and are customized to the competence level of the target group of healthcare professionals. Therefore, existing OERs must be adapted for healthcare professionals' data literacy training.

Key messages:

- The search for OERs on qualitative and quantitative data acquisition yields many results, but less than three percent of the results are suitable for training healthcare personnel.
- Few Open Educational Resources (OERs) for healthcare professionals provide sufficient detail and alignment with their competency levels, which necessitates adaptations for data literacy training.

3.L. Round table: Outcomes from a public debate on the future health priorities of the European Union

Abstract citation ID: ckae144.167

Organised by: European Observatory on Health Systems and Policies
Chair persons: Matthias Wismar (European Observatory), Josep Figueras (European Observatory)
Contact: wismarm@obs.who.int

Objective and background: In the run up to the European elections, the European Observatory on Health Systems and Policies facilitated a public debate on the future health priorities of the European Union. The purpose of the debate was to provide insights to the European Commission on the views of stakeholders and the public health community with regards to the future of the European Health Union (EHU). The EHU was established as a comprehensive health systems and public health response to the COVID-19 pandemic, featuring enhanced budgets, expanded mandates for existing bodies, and the introduction of new entities like the Health Emergency Response Authority (HERA) alongside new strategies.

Methods: The methodology for this comprehensive debate included workshops and plenary sessions at various conferences like the 2023 EUPHA conference in Dublin, an interactive webinar series, and a detailed stakeholder survey featuring both closed and open-ended questions. Data was collected and analyzed using diverse qualitative and quantitative tools, including AI-driven analysis of survey responses.

Preliminary outcomes: Preliminary analysis shows that participants actively engaged in the debate, and mostly expressed support for the EHU's achievements to date. There was a consensus on the significant value added by the EHU, with many advocating for stronger EU action on a range of discussion topics. Stakeholders and the public health community could also relate to the discussion framework designed to guide the public debate, which included nine topics: enhancing health security; addressing the determinants of health through Health in All Policies and Health for All Policies; supporting health system transformation; enhancing the labour market for health and care workers; achieving universal health coverage; implementing digital solutions and AI; improving the performance and resilience of health systems; addressing long-term challenges, such as population ageing or climate change; and strengthening the EU's global voice and leadership. The importance placed on these topics varied among different groups. Young participants prioritized climate-related actions, the public health community emphasized addressing the determinants of health, and policymakers concentrated on issues related to health system resilience, universal coverage, and transformation. Digital solutions and AI were recognized as crucial, but they were typically considered integral and transversal to broader issues rather than standalone priorities. The debate also surfaced priorities not initially included in the discussion framework, such as health promotion, prevention, and equity within health systems, which were repeatedly highlighted.

Key messages:

- The debate on the EU's future health priorities demonstrates that stakeholders and the public health community acknowledge the value of the EHU and would like to see further action to build on it.
- Stakeholders and the public health community have formulated concrete action to take the EHU further.

3.M. Skills building seminar: Culture, Arts and Mental Health

Abstract citation ID: ckae144.168

Organised by: EUPHA-PMH, -ENV
Chair persons: Marija Jevtic (EUPHA-ENV), Jutta Lindert (EUPHA-PMH)
Contact: marija.jevtic@uns.ac.rs

Improving mental health is a challenge, not only for the health sector, so research into innovative ways to improve mental health in the community is necessary. The WHO Regional Office for Europe together with its expert group on the cultural contexts of health and well-being promote a culturally grounded approach to enrich policies related to health and well-being. The cultural contexts of health and well-being argues that incorporating cultural issues into policy-making is critical to the development of adaptive, equitable and sustainable health care systems, and to making general improvements in many areas of population health and well-being. Population health and well-being are influenced by actions external to health care systems, also. By health-in-all-policies approach it is given an understanding of how policies in non-health domains can foster or constrain a culture and art for health. Social prescribing and art-for -health activities are important tool for improvenment mental health. This skils building seminar will discuss some good practice and examples, and also cooperation with experts from cultural sector in the mental health field.

Key messages:

- The innovative concept of cooperation between Culture and Health institutions brought positive experiences and impressions to all participants who used 'culture on prescription'.
- The integration of arts into healthcare and community settings offers a holistic approach to promoting health and fostering well-being.

Abstract citation ID: ckae144.169
Culture for Health – Example from Serbia

Marija Jevtic

M Jevtic[1], A Miljkovic[1], G Vujkov[2], T Palkovljevic Bugarski[2]

Using the possibility of social prescribing at the community level integrates several sectors, primarily the health sector and the culture sector. The goal of this project was to strengthen intersectoral cooperation (culture and health) and consider the possibility of providing conditions in the local community for continuous prescribing of the culture 'on prescription'. Institute for Public Health of Vojvodina invited Matica Srpska Gallery to participate together with the Novi Sad Healthcare Center in a unique project that connects culture and health. The 'Culture on prescription - culture for health' consisted of two phases: curatorial guidance and group workshops. Curatorial guidance means the selection of individual works of art whose narration is planned and methodologically adapted to different groups of participants and which evokes different feelings related to quality of life and health. The second part of the program consisted of workshops in the Museum, enriched with works of art and a pleasant atmosphere.The workshops are based on group analytical methods and participants had the opportunity to reflect their observations, experiences and feelings on individual works of art, and they often reflected with personal life experiences that were not only aesthetic, but also pleasant and therapeutic. Participants came in two sessions, with two different curatorial guides, carefully thematically prepared, and which were later the source for substantive reflection. The positive outcomes of these innovative workshops was confirmed through written and oral facts, through which the participants emphasized that the stay in the museum space was therapeutic in itself. The possibility of the so-called 'depot' or prolonged effect of the unique prescription was observed, emphasizing that the participation in the workshops left an impression on the participants and that they will stay with a positive feeling and pleasantness after receiving a 'dose' of culture for health.

Arts and Mental health

Jutta Lindert

J Lindert[1]
[1]University of Emden/Leer, Emden, Germany
Contact: jutta.lindert@hs-emden-leer.de

Art includes performing arts, visual arts, literature, culture, and online/digital products. Its interventions are multimodal, combining a variety of activities, such as evoking emotions, emotional and cognitive stimulation, and imagination. Depending on the type of art, they may also involve social interaction, physical activity and communication. There is a large body of research suggesting that art engagement can enhance different dimensions of mental well-being (eudaimonic well-being, life satisfaction, evaluative well - and positive emotions). Some or all of these benefits have been found in individuals who participate in art activities. Based on these findings, art on prescription has been used in some European countries, including the United Kingdom, and Scandinavian countries. Art on prescription is mostly delivered in partnership with art organizations. The aim of this talk is give an overview on art on prescription in different countries in Europe and enhance understanding of the mechanism for whom art on prescription is a promising intervention in the field of mental health. Building on the mapping and review of reviews challenges of art interventions will be discussed such as study design or evaluating effectiveness and identifying population groups for whom art interventions work best.

Abstract citation ID: ckae144.171
Mental Health Arts Festival as a tool for mental health promotion

Karolina Zakarauskaite

K Zakarauskaite[1], *M Jakubauskiene*[2]
[1]The Mental Health Arts Festival, Vilnius, Lithuania
[2]Vilnius University, Vilnius, Lithuania
Contact: karolina.zakarauskaite@gmail.com

Background of the problem: 1 in 4 people experience mental health problems each year, and that number is only growing. Stigma and discrimination of mental health are widespread and affect the quality of life at the individual and societal level. The WHO identifies mental health arts festivals as an effective way to reduce stigma and improve mental health.

Description of the problem: We are not comfortable talking about mental health difficulties and the care we need. Consequently, individuals often withhold personal experiences to shield themselves from potential bias and harsh judgement.

Methodology: The Mental Health Arts Festival (MHAF) Bonds https://www.rysiaifest.lt/, https://www.facebook.com/Rysiaifest) seeks to contribute to the human rights based mental health knowledge creation across the partner organisations, involved communities and audiences, as well as contribute to local creation of artworks on the topic of mental health in open, accessible, safe space where every voice matters. The biannual MHAF brings together recognised artists, arts institutions, scientists, policy makers and communities of people with mental health issues (over 80 events, attracting about 4,500 spectators) for group exhibition, films, contemporary dance and live performances, literary readings, open microphones, followed by discussions and workshops. Qualitative study methodology is applied to assess the potential impacts of the MHAF.

Lessons:

- Visual identity that seeks to challenge existing stigmatising views.
- The festival has become the production or premier place of new artworks on the topics of mental health, spanning addiction, war-related trauma, transgenerational trauma, neurodiversity.

Key messages:

- Mental health arts festivals promote mental health literacy and reduce negative attitudes towards health-seeking behaviour.
- Art festivals should be an integral part of national programs to address stigma and promote mental health and well-being.

3.N. Round table: Health inequalities over life-course between people with & without childhood social care experience

Abstract citation ID: ckae144.172

Organised by: University of Glasgow (UK), EUPHA-CAPH
Chair persons: Mirjam Allik (UK), Sonia Saxena (EUPHA-CAPH)
Contact: mirjam.allik@glasgow.ac.uk

The burden of ill health is not carried equally, children and young people with experiences of childhood social care (CSC), e.g. kinship, foster, residential or 'out-of-home' care, are affected by multiple cumulative disadvantages and experience high inequalities in health compared to the rest of the population. CSC, and the adversities often associated with it, are linked to health problems that persist into adulthood and adversely affect education, employment, and the future European society.

Public and policy interest in improving outcomes for CSC recipients has increased markedly, as has research on the association between CSC and life outcomes. But current research is siloed, with limited comparative perspective and has not led to a strong evidence base to inform policy and practice. Wider international networks to connect research, practice and policy are needed to change this. The objective of the workshop is to bring together evidence on health inequalities between people with and without CSC experience across Europe. The panel will set the scene for the discussion by raising questions that stem from their work for the audience to respond. We will ask the audience to engage with these questions based on their experience (e.g. academic, clinical or other professional). The real-time reactions will be collected via Mentimeter during presentations, moderated and fed back to the audience and panel for discussion. This will allow us to collect diverse responses across countries and from different professional perspectives, providing learning and insights for both the panel and audience. The added value of a EUPHA workshop is the high-profile European level attention on this population. A spotlight on CSC experiences bringing together evidence from topic experts and health practitioners committed to improving childhood health inequalities across Europe and will foster a strong foundation for future collaborations and comparative research. The format is interactive and will include an introductory video of lived experiences of CSC to put a human face on this topic. We will then hear 4x5 minute expert presentations from social epidemiologists, health and social care professionals (20m) followed by a moderated discussion with the audience (35m). The presentations cover research across Europe, consider how inequalities accumulate across the life course to place children in care settings and identify where gaps in services fail children. MA sets the scene by asking what the international evidence is telling us about the health of people with CSC experiences. VS explores the accumulation of disadvantage across the life-course and intergenerational experiences of CSC. HF uses the Swedish example to ask why welfare services are not meeting the health needs of children. Finally, SS will consider solutions: what additions support is required for health practitioners dealing with children in care settings and what can/cannot be achieved from within the doctor's office?

Key messages:

- Participants will gain new insights on the health of children with social care experience from each other by sharing evidence and discussing key questions from diverse perspectives across Europe.
- The workshop provides a foundation for participants to build future international networks and comparative research that will lead to a strong evidence base to inform policy and practice.

Abstract citation ID: ckae144.173
Lived experiences: What made or would have made a difference to me when growing up?

Mirjam Allik

M Allik[1]
[1]SPHSU, University of Glasgow, Glasgow, UK
Contact: mirjam.allik@glasgow.ac.uk

We sometimes forget the people behind the numbers and those affected by our research. The video on lived experiences aims to put a human face on childhood social care ahead of the panel and audience discussion. Rather than asking care experienced people specifically about their health, which people may find intrusive or even irrelevant for their experience, we will seek to understand what did or would have made a difference to their lives. Dr. Allik, who has led and facilitated a number of knowledge exchange and engagement activities related to childhood social care, will take the responsibility of organising the collection different video recordings on lived experienced of childhood social care. We will work in collaboration with already existing organisations that advocate for (care experienced) children's rights to produce the video. Dr. Allik will also be supported by the knowledge exchange team at the UofG, including choosing the appropriate methods of seeking recordings, compiling, and curating the video.

Abstract citation ID: ckae144.174
What does international evidence tell us about the health of people with childhood social care (CSC) experiences?

Mirjam Allik

M Allik[1], *D Bradford*[1]
[1]SPHSU, University of Glasgow, Glasgow, UK
Contact: mirjam.allik@glasgow.ac.uk

International research into the health of people with childhood social care (CSC) experiences has found evidence of worse mental health and emotional-behavioural wellbeing, higher rates of substance use, neurodevelopmental conditions, and avoidable mortality. Lower vaccination rates and worse dental health among those in care has also been reported in few countries. However, research results have been more mixed with regard to some physical health conditions, with higher prevalence of asthma and respiratory ill health among foster children reported in the US but no obvious differences found in the UK. Are there countries where these inequalities are less pronounced, and can we draw such conclusions based on available evidence? When making international comparisons or aiming to give policy advice, we also need to consider the quality of our evidence. Has this been based on small sample sizes or without comparison to other children and adjusting for relevant (socioeconomic) confounders? Most of our current knowledge is also cross-sectional and we do not know if some health conditions precede entry to care and may even be risk-factors for entering social care. Recent longitudinal and cross-sectoral data linkage programmes in many nations (Australia, UK, Canada) have a potential to change this and provide a foundation for evidence-based recommendations for policy and practice.

Abstract citation ID: ckae144.175
What long-term health outcomes can we anticipate for children who have been in social care?

Viviane Straatmann

V Straatmann[1]
[1]Department of Public Health Sciences, Stockholm University, Stockholm, UK
Contact: viviane.schultz.straatmann@su.se

The concept of cumulative disadvantage suggests that setbacks in one area of life not only lead to further challenges within that domain but also increase vulnerability to adversities across different domains, as highlighted in life course studies. In the context of children with a history of childhood social care (CSC) experience, research consistently shows poorer long-term health outcomes compared to peers without such experiences. This disparity persists into middle age and can affect subsequent generations, underscoring the enduring impact of early-life adversity. Dr Viviane S. Straatmann, a social epidemiologist based in Sweden and enriched by her experience in studying the health and social life of vulnerable children in diverse international settings, will offer insights from life-course and intergenerational epidemiological studies. She will explore the intricate web of disadvantages preceding children's entry into social care, shedding light on the complex interplay between early-life adversity, cumulative disadvantage, and long-term health outcomes. Participants will engage in reflective dialogue on pertinent questions, such as how cumulative disadvantage informs interventions for children with CSC backgrounds, the potential mechanisms underlying the contribution of early-life adversities to long-term health disparities, and the ways intergenerational studies can inform strategies for breaking the cycle of disadvantage.

Abstract citation ID: ckae144.176
What challenges exist within the child welfare system in meeting the health needs of children in care?

Hilma Forsman

H Forsman[1]
[1]Department of Social Work, Stockholm University, Stockholm, UK
Contact: hilma.forsman@socarb.su.se

From society's perspective, the goal of societal care is to protect disadvantaged children and provide them with improved opportunities. In the realm of social care, the child welfare system takes the place of parental responsibilities to safeguard children's well-being and developmental needs, including their health. However, while holding child welfare agencies responsible, national legislation often lacks specific methods for fulfilling this mandate. Over the years, evidence has shown that limited health care access and unmet health needs often endure in care. In Sweden, efforts to address the issue include mandatory health assessments upon entry into care and collaborative agreements between social services and health care sectors. However, recent studies reveal that only one-third of children undergo these assessment, and collaborative agreements remain lacking in many local authorities. This suggests that additional legal requirements do not offer a straightforward solution. Dr Forsman, with a background in social work, will discuss the child welfare system's responsibilities and the traditional reliance on social workers and foster carers to address health needs and coordinate care. What are the underlying barriers to successful advocacy and comprehensive health care coordination within the child welfare system? How can the system better respond to the health needs of children in care?

Abstract citation ID: ckae144.177
How can health practitioners support children and young people in social care?

Sonia Saxena

S Saxena[1,2]
[1]EUPHA-CAPH
[2]School of Public Health, Imperial College London, London, UK
Contact: s.saxena@imperial.ac.uk

Health practitioners are responsible for safeguarding, delivering preventive and responsive care for children and young people in social care settings. However, drivers and determinants that place children in care settings lie outside of the doctor's office. In fact, primary care health practitioners often deal with children and young people who face or are at risk of severe neglect, abuse or vulnerability outside the care system. Recent findings from the UK's Millennium cohort study have repeatedly demonstrated that social disadvantage in the early years accounts for more than 2/3 of health inequalities in adolescence. Professor Saxena is a practising GP with 25 years of experience of inner-city primary care and global expert on primary care of children. She will present dilemmas posed in clinical settings for health practitioners and professionals working in a broad range of areas including public health, education settings and social care. What responsibility do health professionals have when they encounter children living in social care settings? What should they be especially alert to? How can they make a difference to reduce health inequality faced by young people growing up in the care system.

3.O. Scientific session: Migrant labour exploitation and health: How can research foster protection of migrant workers?

Abstract citation ID: ckae144.178

Organised by: Bielefeld School of Public Health (Germany), Lancet Migration European Regional Hub
Chair persons: Nora Gottlieb (Germany), Sally Hargreaves (UK)
Contact: nora.gottlieb@uni-bielefeld.de

Migrant workers sustain essential industries such as the food supply chain, construction, and domestic and care work. They tend to perform onerous and risk-laden tasks at low pay without employment or health protections, and often under exploitative terms (e.g., debt bonding, piecework). Current evidence on associations between migration, employment terms and conditions, and health indicates profound inequities in work-related health outcomes for migrant workers. Although the COVID-19 pandemic highlighted these disparities and their potential social and public health implications, migrant workers continue to be overlooked by public health scholars and policymakers. Supranational regulations (such as EU directives) and national policies rarely consider migrants in their role as workers, and little research is dedicated to questions at the intersection of migration, employment, and health. The invisibility of migrant workers is also a matter of disciplinary and sectoral silos, with different aspects of migrant labour regulated separately by Ministries of Immigration, Labour, Agriculture, Health, and others. These silos create incompatible, context-contingent definitions, terminologies, and administrative categorizations, leading to inconsistent data collection and data gaps which, in turn, translate into policy blind spots. Data that are comparable across contexts and that refer to migration, employment/work and health are generally scarce. For some sectors and contexts, virtually no data exist; e.g., for migrant workers in agriculture, construction, and domestic work, and for migrant workers in low- and middle-income countries. There is barely any evidence about interventions to improve the structures that dictate migrant workers' employment conditions or obligations of employers. Given the limited participatory research with migrant workers, we have a very poor understanding of their views and viable intervention options, and migrant workers' voices thus also remain absent from policymaking. This workshop aims to contribute to greater visibility of - and ultimately action on - migrant labour exploitation in research and policy. To this end, it will map current challenges and shortcomings in generating evidence on the links between migration, work/employment, and health; and it will suggest ways to improve research and interventions to address migrant workers' health, based on the speakers' experience in developing intervention-focused evidence in different contexts. The workshop will conclude with an open discussion to identify further relevant questions and elaborate steps towards better research and greater protections for mobile worker populations.

Key messages:

- Harm from exploitative working conditions among migrant workers is substantial, yet data collection methods and intervention designs are limited.
- For public health research to effectively help protect the health and rights of migrant workers, it is essential to share methods and insights across disciplines to drive research for action.

Abstract citation ID: ckae144.179
Understanding labour exploitation as a social determinant of health in migrant populations – insights from the Danish population-based registers

Karen Lau

K Lau[1]
[1]St. George's, University of London, London, UK
Contact: m2210868@sgul.ac.uk

Despite recent global events such as the COVID-19 pandemic and the Qatar world cup drawing attention to the significant loss of human lives of labour migrants in precarious working conditions, evidence on the comparative mortality of migrant workers remains sparse and inconsistent. Studying the comparative mortality of migrant workers with local workers is challenging for several reasons. Data on migrants' employment conditions and health outcomes are often incomplete, and when available captured in separate databases. In addition, there is a need to disentangle the healthy migrant effect from the healthy worker effect, which presents challenges in the selection of reference populations and temporality when studying mortality of migrants. In view of such challenges, Denmark provides an ideal context to study labour migration and mortality. The Danish population-based registers offer linked longitudinal data on migrants' employment history and mortality outcomes. Denmark's migrant integration policy also has a history of weaving immigration and labour policies, and migrants in

Denmark continue to be prone to labour exploitation in high-risk industries such as construction and agriculture. This presentation shall use Denmark as a case study to compare the mortality outcomes of migrant workers with Danish workers to better understand labour exploitation as a social determinant of health.

How do communities define “work precarity” and “labour exploitation”? Lessons for research from participatory research in high economic hardship communities in Chicago, Illinois/USA

Linda Forst

L Forst[1], obo Greater Lawndale Healthy Work Council[2]
[1]Occupational and Environmental Health Sciences, University of Illinois, Chicago, USA
[2]Chicago, USA
Contact: lforst@uic.edu

Labour migration has both social and economic drivers that channel workers into jobs that are less desirable to citizens of the receiving countries. Immigrant workers find jobs through contacts from their home countries, including temporary staffing companies. These workers tend to co-locate in segregated communities and coalesce in jobs that entail hard work, low wages, and limited social benefits. As such, labour migration adds a dimension to the structural and social determinants of health (SDOH) that can broaden our understanding of health inequities, and that can point us toward policies and practices to enhance the health and wellbeing of migrant workforces. However, to generate evidence, align interventions with workers’ needs and priorities, and move evidence to action, it is crucial to engage communities. This presentation describes a community-university research partnership that co-investigates the relationship between work and health as experienced at the community level in two high-economic-hardship neighbourhoods in Chicago, Illinois/USA. The academic and practice partners co-developed and tested a conceptual model of the interrelations among migration, work and health, conducted an inventory of local employers, and executed a street-level survey of 497 workers in these two communities. The research findings helped enhance existing models of the structural/social determinants of health and of work precarity, thus informing methodological approaches to measure work precarity, labour exploitation, and their health effects. The community-based participatory research further led to several action-research projects that are ongoing. This presentation will describe the development of the community-university research partnership and its work, the subsequent enhancements made to the worker precarity and SDOH models, and preliminary findings of the partnership’s current action-research projects.

How can we measure labour exploitation and develop interventions to protect migrant workers’ health? Insights from intervention-focused research on cattle ranching in Brazil and child domestic work in Liberia and Nigeria

Cathy Zimmerman

C Zimmerman[1], E Keaveny[2]
[1]Gender Violence Unit, LSHTM, London, UK
[2]NORC, University of Chicago, Chicago, USA
Contact: Cathy.Zimmerman@lshtm.ac.uk

Much of our food and services rely on the work of migrants, which is often carried out under exploitative terms. Exploitative work results in work-related injuries and illnesses and mental ill-health. Yet, the global health community has been negligent in detecting migrant workers in the general population, and in measuring the effects of their work terms on their health. For instance, the International Labour Organization’s global labour force and forced labour surveys capture few health data. Conversely, health surveys, such as the Demographics and Health Survey (DHS), include few questions on exploitative and hazardous work conditions or aspects of migration status. Studies are even more remiss when it comes to developing evidence for work-related health interventions. This presentation will draw on two recent mixed-methods studies - on cattle ranching in the Amazon region of Brazil (Pará State) (n = 1,241), and on child domestic work in Liberia (n = 1,088) and Nigeria (n = 1,088). Findings suggest some necessary improvements to the measurement of migrant labour exploitation and its health effects, and approaches to gathering intervention-focused evidence. Each study highlights the value of re-thinking data collection beyond disciplinary silos and narrow dichotomous measures (e.g., forced/unforced labour), towards generating a more specific understanding of the different dimensions of labour exploitation (e.g., pay conditions, hours, occupational health and safety training and PPE), various types of associated harm, and how they compare across sectors and contexts. Further, each study demonstrates the benefits of intervention-focused research methods that are designed to feed directly into participatory intervention development processes. On this basis, we will suggest shifts in measurement and research designs to foster operationalizable evidence on migrant workers’ working conditions, health, and worker-informed interventions.

3.P. Pitch presentations: Data, assessments, impact

Comparing Italian hospital discharge and mortality data: implications for epidemiological research

Katherine Logan

K Logan[1,2], A Corbetta[1,2], F Ieva[1,2], E Di Angelantonio[1,3]
[1]Health Data Science Centre, Human Technopole, Milan, Italy
[2]Department of Mathematics, Politecnico di Milano, Milan, Italy
[3]Department of Public Health & Primary Care, University of Cambridge, Cambridge, UK
Contact: katherine.logan@polimi.it

Background: In Italy, regional governments maintain data warehouses of linked administrative health data (AHD) linked to demographic information including mortality. Legal reporting pathways for death certificate detail bypass the Region, resulting in significant amounts of missing data on cause and location of death in regional AHD warehouses and limiting epidemiological research on mortality and incidence. In this study, we determine for the first time in Italy the degree of agreement between last hospital diagnosis and primary cause of death, and how that agreement changes over time. Previous studies have found agreement ranging from 40% to 60%.

Methods: The COV-CVD cohort is comprised of 7.3 million adults aged 30+ from the Lombardy region of northwest Italy, representing all Lombardy residents registered with the health system as of 31 December 2019. Concordance was assessed using the first three characters of the reported cause of death (ICD-10 codes) and primary diagnosis at last hospitalization (converted from ICD-9CM).

Results: In the COV-CVD cohort there were 401,085 deaths between 1 January 2020 and 23 June 2023. Cause and location of death is missing for 50% and 54% of these deaths, respectively. 60% of deceased individuals had a hospitalization in the year before their death. Agreement between primary diagnosis at last hospitalization and cause of death was 27% overall and 40.5% for deaths in hospital. Missing location of death was reduced from 54% to 26%.

Conclusions: When using AHD from Italy, primary diagnosis at last hospitalization prior to death is not an appropriate proxy for cause of death, even when the death occurred in hospital. Different coding systems (ICD-10, ICD-9CM) further complicate comparisons and definitions in observational studies.

Key messages:

- In Italy, primary diagnosis at last hospitalization before death is not an appropriate proxy for cause of death.
- Poor linkage of mortality and health data limits epidemiological research.

Abstract citation ID: ckae144.183
Impact of primary course COVID-19 vaccination on hospitalizations in Belgium, a Bayesian approach

Elias Vermeiren

E Vermeiren[1], *T Braeye*[1], *V Stouten*[1], *L Nasiadka*[1], *M Billuart*[1], *I Van Evercooren*[1], *JAF van Loenhout*[1]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
Contact: elias.vermeiren@sciensano.be

Background: The Belgian COVID-19 primary course vaccine rollout was prioritized for individuals aged 18-64 years with underlying health conditions (increased risk of severe COVID-19), over their peers of the same age. This led to a 32-day earlier vaccination of prioritized individuals. In this research, we assessed the impact of vaccine rollout prioritization on hospitalizations for COVID-19 in Belgium between April 1st 2021 and June 30th 2021.

Methods: The sample consisted of the Belgian population aged 18-64 years. Individuals were classified by their priority status according to underlying health conditions and by vaccination status, creating weekly changing cohorts. The hospitalization probability was estimated by cohort using a national COVID-19 hospital surveillance. Two counterfactual scenarios were considered: (1) a no vaccination scenario and (2) a scenario in which the vaccine administration occurred at random in both cohorts (a vaccine rollout without prioritization). We used a Bayesian model to jointly estimate cohort-specific hospitalization probability and scenario outcomes.

Results: Out of the sample of 5,448,534 individuals, 22.65 % was prioritized. By May 1st, vaccination coverage was 18% and 2% within the prioritized and the non-prioritized cohort. In scenario 2, coverage within the prioritized was 6% by May 1st. There were 6968 hospitalizations reported through the hospital survey. Our initial scenario-outcomes indicated a reduction in hospitalizations of 3203 (95%CI[2548;3858]) and 919 (95%CI[406;1433]) by the vaccination prioritization, compared to scenarios 1 and 2, respectively.

Conclusions: This research provides insights in the impact of vaccination in a pandemic context in Belgium. We report a significant reduction in simulated COVID-19 hospitalization by vaccine prioritization compared to at random vaccination and no vaccination at all. Currently, we are investigating the effect of age-dependent vaccination next to at random vaccination.

Key messages:

- The prioritised vaccination campaign in Belgium led to a significant reduction in hospitalizations.
- Prioritisation based on underlying health conditions is an important public health measure.

Contact: sarah.nayani@sciensano.be

Despite numerous efforts worldwide to reduce the harmful effects of alcohol, its impact on health remains significant, contributing significantly to the loss of healthy life years. In Belgium, alcohol use is still a major public health concern, ranking among the highest in alcohol consumption across Europe. This study aims to use available nationally representative data to estimate and evaluate the time trends of alcohol use patterns in Belgium from 2013 to 2018. We used repeated cross-sectional survey data from the Belgian Health Interview Survey (BHIS), which includes self-reported alcohol use and sociodemographic data, to create a time series of annual consumption from 2013 to 2018. This included current and former drinkers, and lifetime abstainers by year, sex, region, and age groups. We applied a Bayesian hierarchical model, using the Integrated Nested Laplace Approximation to create the time series and forecast trends for 2020. In Belgium, the prevalence of current drinking remained at a similar level of 80% from 2013 to 2020, with similar rates observed in the Flemish (FL) and Walloon (WA) regions. However, the Brussels-Capital region (BR) had a slightly lower prevalence of 70%. Trends remained relatively stable across all regions during this period. The national level of former drinkers increased from 5% in 2013 to 8% in 2020, with BR and FL showing similar increases, while WA experienced a decline. Abstainer rates rose from 15% in 2013 to 19% in 2020 nationally, with varying increases in each region. Specifically, abstainer rates in FL increased from 13% to 17% and in WA from 14% to 20%, while BR saw an increase from 19% to 22%. Overall, declining trends were evident, with men exhibiting higher prevalence rates across all categories. Time trends from the BHIS reveal consistent and high use of alcohol in Belgium over 7 years, emphasizing the ongoing public health challenge. Urgent policy interventions are needed to reduce the impact of alcohol on health

Key messages:

- Alcohol use in Belgium is still a pressing public health issue, with high prevalence rates of current drinking in the population. Different patterns of alcohol use can be seen between regions.
- Understanding the role of alcohol on population health as an attributable burden can improve health monitoring.

Abstract citation ID: ckae144.185
Consumption and expenditure of antidepressants and anxiolitycs in 14 European countries

Manuela Martella

M Martella[1], *E Minutiello*[1], *MM Gianino*[1]
[1]Department of Public Health and Pediatrics, University of Turin, Turin, Italy
Contact: manuela.martella@unito.it

Background: Since the burden of depressive and anxiety disorders, assessing the use and spending of drugs commonly prescribed for treating such conditions is a valuable barometer of mental health assistance and healthcare services. The current research aims to evaluate the consumption of antidepressants and anxiolytics and the relative expenditure among 14 European countries (Austria, Czech Republic, Finland, Germany, Hungary, Italy, Latvia, Luxembourg, Norway, Portugal, Slovak Republic, Slovenia, Spain and Sweden).

Methods: A retrospective longitudinal study was assessed based on pooled time series analysis of secondary data over ten years (2012-2021). Defined Daily Doses (DDD) per 1,000 inhabitants and health expenditure per capita (current US$, computed on purchasing power parity) were considered. Linear and quadratic trends were calculated for defining relationships between the variables of interest.

Results: Prevailing patterns of consumption and spending show an increase in antidepressants and a decrease in anxiolytics. Noteworthy is the growth slope of antidepressant consumption in three selected countries, Portugal, Spain, and Sweden, by over two and a half times from 2012 to 2021. In addition, for a few countries, there is a pattern contrary to most countries for anxiolytics (Latvia, Spain) and discordant between consumption and expenditure for antidepressants (Austria, Hungary).

Conclusions: The widespread growth of antidepressant use deserves attention. As a public health issue, the prescription and use of antidepressants should be addressed by targeted policies for integrating multifaceted strategies.

Key messages:

- Monitoring consumption and expenditure of antidepressant and anxiolytic drugs represents a valid tool for assessing the efficacy and availability of mental healthcare services among the population.
- The growth in the consumption of antidepressants represents a relevant public health issue and deserves attention for the evaluation of an integrated approach of assistance.

Abstract citation ID: ckae144.186

Measuring laypeople's notions of intersex in the Netherlands and Flanders

Jenneke van Ditzhuijzen

J van Ditzhuijzen[1,2], *DJ Hessen*[3], *J Motmans*[4]
[1]Interdisciplinary Social Science, Utrecht University, Utrecht, Netherlands
[2]Obstetrics & Gynecology, Amsterdam UMC, Amsterdam, Netherlands
[3]Methods & Statistics, Utrecht University, Utrecht, Netherlands
[4]Center for Sexology & Gender, Ghent University Hospital, Ghent, Belgium
Contact: j.m.vanditzhuijzen@uu.nl

Introduction: In emancipation policy, the 'I' is often added to the LGBTI+-acronym. Yet it is still unknown to what extent this term is known and understood by the general population, and what attitudes toward intersex (people) are. In the current study, we describe the construction and development of the Intersex Knowledge and Attitudes Scale (IKAS), as well as the results from this baseline measurement in the Dutch and Flemish population.

Methods: The IKAS was developed after a carefully documented stepped process of literature scan, expert consultations, and pretesting. A representative sample of 2,003 respondents (1,000 Dutch and 1,003 Flemish) participated in the study. To determine the dimensionality of the scale, we performed EFA and CFA with measurement invariance constraints. We also performed a baseline measurement of knowledge and attitudes towards intersex people in the general population, and determined predictors of attitudes toward intersex people in regression analyses.

Results: Two-thirds of the sample had no (correct) knowledge of the term intersex. Even among the intersex respondents, only one person was aware of the term intersex. The average attitude was moderately positive to neutral. Having a female gender or birth sex, an advanced level of education, lower importance of religion, belonging to a minority group, more tolerant gender beliefs, and preexisting knowledge on the topic all resulted in more positive attitudes.

Conclusions: Both in Flanders and the Netherlands there still is room for improvement in terms of knowledge and attitudes towards intersex people. More knowledge may lead to more understanding, so that intersex people can be more open. Second, it is recommended to challenge beliefs of sex and gender as binary categories, because people who have less issues with people who do not entirely fall in these categories, also have more accepting attitudes toward intersex people.

Key messages:

- It is vital to include intersex in monitoring studies of population attitudes, to be able to genuinely incorporate the 'I' in LGBTI+ in emancipation policies.
- To increase acceptance of intersex people in society, knowledge about intersex in the general population should be expanded, and acceptance of people who do not fit into the binary should be promoted.

A matter of measurement? Segregation and all-cause mortality in Sweden's three metropolitan regions

Agneta Cederstrom

A Cederstrom[1,2], *A Dunlavy*[1,2]
[1]Public Health Sciences, Stockholm University, Stockholm, Sweden
[2]Centre for Health Equity Studies, Stockholm University, Karolinska Institutet, Stockholm, Sweden
Contact: agneta.cederstrom@su.se

Background: Residential segregation can be operationalized and measured in many ways, along distinct dimensions. There are multiple mechanisms through which segregation and health mutually affect each other. Consequently, contextual health effects of segregation may vary depending on how segregation is measured.

Methods: We used longitudinal Swedish register data to compare associations between local measures of residential segregation (migrant density, migrant isolation, and the mutual information index) and all-cause mortality among the adult migrant and native-born populations in Sweden's three largest metropolitan regions between 2004-2016.

Results: Among migrants, modest positive mortality gradients were observed across measures of migrant density and isolation, where a higher level of segregation was associated with higher risks of all-cause mortality (Q5 RR ranged from 1.08-1.20 across cities and measures). However, these effects were largely attenuated by individual-level socioeconomic factors, and reversed when further controlling for neighborhood economic deprivation (Q5 RR ranged from 0.74-0.87). Among the native-born, a positive gradient for mortality was found (Q5 RR ranged from 1.31-1.45), although this was reduced when accounting for neighborhood deprivation (Q5 RR ranged from 1.01 -1.11). For both migrants and the native-born, the mutual information index showed no clear association with mortality, although a mortality advantage is observed for migrants in the most segregated areas after individual and neighborhood level adjustments (Q5 RR ranged from 0.73-0.86).

Conclusions: Our findings show that the manner in which residential segregation is conceptualized and operationalized alters associations with health. However, individual and other contextual level confounders are important determinants which influences the patterns. Much of the negative health effects of residential segregation can be perceived through the lack of economic opportunities.

Key messages:

- Associations between segregation and all-cause mortality depends on how segregation is conceptualized and measured.
- The mortality disadvantage observed in local areas with high migrant density may be attributed to the lack of economic opportunities in the neighborhood.

3.Q. Pitch presentations: Health workforce, patient safety

[4]Medical University Sofia, Sofia, Bulgaria
[5]Theofanis Alexandris LTD, Athens, Greece
[6]Hellenic Pediatric Nursing Association, Athens, Greece
Contact: c.nicolaou@cut.ac.cy

Background: Extended Reality (XR) technology intends to combine or mirror the physical world, including innovative tools that can be applied in education increasing students' engagement, improving comprehension, and leading to better outcomes. Under the umbrella of the PedXR project about an Extended Reality Learning Framework for Pediatric Nursing students in Higher Education (Erasmus +- 2023-1-EL01-KA220-HED-000161808), a survey was conducted aiming to validate a questionnaire to evaluate Students' Learning Needs using XR technology (SLN-PedXR).

Methods: The questionnaire was developed by item generation through a literature review. The SLN-PedXR was validated in terms of content validity through PedXR Consortium (EL, CY, BE, BG) reviews. The psychometric properties of the final instrument were assessed in a sample of 106 nursing students of the Faculty of Nursing, University of Athens, Greece.

Results: The findings demonstrate high internal consistency (Cronbach's alpha = .877). Principal component analysis was conducted to reduce dimensions and establish construct validity and internal consistency of the developed questionnaire. Following pilot-testing and consortium review, the final validated questionnaire consists of 45 items divided into 3 subcategories (current learning needs satisfaction, preferable learning modules, XR development).

Conclusions: The SLN-PedXR is a valid and reliable tool for evaluating students' learning needs using XR technology.

Key messages:

- In the rapidly evolving landscape of technological advancements, educational institutions must integrate innovative learning tools into their curricula.
- The discernment of students' learning needs and the formulation of tailored modules stand as pivotal determinants to optimize educational outcomes particularly within the domain of nursing education.

The Critical Role of Perceived Academic Institutional Support among Students in a Divided Society

Carmit Satran

C Satran[1], *N Idilbi*[1,2], *D Arieli*[1,3], *O Ali-Saleh*[1], *O Halperin*[1]
[1]Nursing, The Max Stern Yezreel Valley College, Emek Yezreel Valley, Israel
[2]Nursing Research Unit, Galilee Medical Center, Nahariya, Israel
[3]Sociology and Anthropology, The Max Stern Yezreel Valley College, Emek Yezreel Valley, Israel
Contact: carmits@yvc.ac.il

Background: To promote health equity, nursing schools must foster student diversity and develop future nurses' abilities to care for patients from different backgrounds. Although academic experiences play an essential role in promoting multiculturalism, in Israel, where the Jewish-Arab divide is deep and central, this could be challenging. This study examined the attitudes of Israeli Jewish and Arab nursing students concerning their interactions across group lines.

Methods: In December 2022, 362 undergraduate students completed a survey on the association between cultural intelligence (CQ), satisfaction with the college's support, and intergroup social interaction.

Results: The findings revealed that (1) Arab students (minority group) demonstrated higher CQ, especially regarding awareness of cultural differences and motivation for intercultural encounters; (2) Arab students perceived the intergroup encounter with Jewish students as closer and warmer than Jewish students; (3) Arab students' satisfaction with the college's support was higher than that of Jewish students; (4) Structural Equation Modeling revealed that ($\chi2/df=1.61$, CFI=.970, TLI=.955, NFI=.927, RMSEA=.041) the support provided by the educational academic setting serves as a primary explanatory factor in the association between CQ and social distance.

Conclusions: Educational institutions should ensure their students feel supported to facilitate closer social interactions. This emphasizes the importance of proactive measures to encourage diversity and cultural competence in nursing education. Such efforts may positively impact the students' mental health and enhance patient care.

Key messages:

- To foster student social interaction in divided societies, academia must ensure a high sense of support.
- Proactive nursing education promoting diversity and cultural competence may benefit student mental health and patient care.

Abstract citation ID: ckae144.190
Balancing public health and public safety: a situational analysis of a substance use pathway

Susie Sykes

T Mills[1], *M Jarrett*[2], *E Chaplin*[1], *J Mallion*[3], *J Wills*[1], *S Sykes*[1]
[1]PHIRST South Bank, London South Bank University, London, UK
[2]University of Birmingham, Birmingham, UK
[3]National Children's Bureau, London, UK
Contact: sykess@lsbu.ac.uk

Background: Public health solutions to substance use harms are of interest across Europe, where the level of health need among detainee populations is broadly consistent. A need for multiagency working is widely recognised, as well as role changes with a view to the police engaging in health generating activity, as part of the wider public health workforce. This qualitative study explores the prospect for a multiagency, public health pathway in an English county district. This involved multiagency working across the community and custody settings.

Methods: 25 semi-structured interviews with senior and frontline staff of diverse agencies involved in pathway development, including public health, police, treatment providers and the NHS. A 'frame-critical' situational analysis sought to understand the strengths, weaknesses, opportunities and threats presented by the pathway. Data were organised into themes.

Results: Three themes highlighted the challenges and opportunities for addressing substance use harms via multiagency collaboration across the community and custody settings. The themes highlighted how 1) agencies' shared commitment to public health was unsettled by subtle differences on the meaning of prevention; 2) community police were more accepting of new health activity than custody police; 3) a trade-off impeded a proactive approach: the need for substance worker capacity to support police in the custody suite (a reactive approach) meant that limited community outreach was possible, despite opportunities for preventative community work involving substance workers and community police.

Conclusions: Public health solutions are challenging to develop in a context of contrasting understandings of 'public health', unclear national policy and resource constraints. The design of multiagency public health pathways must be participatory and inclusive to ensure staff buy-in: in particular, new health activities need to align with police staff's sense of role congruence.

Key messages:

- Multiagency public health collaborations should start by establishing a shared understanding of what 'public health' and 'prevention' mean.
- A long-term perspective on training and motivational alignment (e.g., via feedback) is necessary to implement health-related activity among custody police staff.

Enhancing digital health competencies: insights from european human resources for health

Luis Lapao

MR Maia[1,2,3], *MS Paulo*[3], *LV Lapão*[1,2]
[1]Department of Mechanical and Industrial Engineering, NOVA SST, Caparica, Portugal
[2]Intelligent Systems Associated Laboratory, Guimaraes, Portugal
[3]Comprehensive Health Research Center, NOVA Medical School, Lisbon, Portugal
Contact: luis.lapao@ihmt.unl.pt

Background: Mixed-skills for digital health transformation are critical for human resources for health (HRH). This study aimed to inform the design of new training programmes that address soft, hard and digital health skills.

Methods: Using a mixed-methods design science approach, focus groups were conducted by invitation and with informed consent, online or in-person. A script was prepared with key questions for orientation and facilitation, addressing the topics of current situation, desired situation, desired skills, practical and organisational needs to implement continuous training in healthcare. The collected data were analysed using Nvivo.

Results: Focus groups (14) had 87 participants (Norway, Latvia, Belgium, Italy and Portugal): 26 healthcare professionals (nurses, midwives, nutritionists, pharmacists, assistants and doctors); 27 managers or directors of hospitals and care centres; 34 experts (digital health specialists, researchers, technical officers, members of professional societies and national authorities). Real needs were identified, with 2 direct sub-themes that were best related to each other (Pearson coefficient, $p > 0.40$ - cluster analysis):

1. 'Current situation': Cybersecurity (eg. privacy, law and ethics); Time (work time versus private time, $p = 0.69$); Type (informal versus formal training, $p = 0.32$); Programmes (graduation, continuing education and post-graduation levels).

2. 'Desired situation: Desired skills (eg. digital - basic ICT, data analysis, soft - communication, emotional intelligence, and hard skills - medication administration, catheters, ECG, vital signs, telehealth - digital stethoscope); Learning design and objectives (eg. collective learning, simulations, location - peer-to-peer and hybrid); Emergency care and the link between primary and secondary levels of care were considered important.

Conclusions: These findings of convergence among HRH inform Program design process to support the training programs and course syllabus design.

Key messages:

- The identified needs and priorities inform Program design further to support Digital Health Transformation training programs and course syllabus design.
- Real needs points to Current and Desired situation, where HRH give important insights that need to be considered to engage people to perform training courses.

Abstract citation ID: ckae144.192
Empowering Educators: Italian Nurses' Knowledge, Attitudes, Practices, and Vaccine Hesitancy

Azzurra Massimi

E Renzi[1], *N Panattoni*[1], *V Baccolini*[1], *G Migliara*[2], *E Di Simone*[1], *C Marzuillo*[1], *C De Vito*[1], *P Villari*[1], *A Massimi*[1]
[1]Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Life Sciences, Health and Health Professions, Link Campus University, Rome, Italy
Contact: azzurra.massimi@uniroma1.it

Background: Vaccine hesitancy (VH) among healthcare workers is a prevalent global phenomenon and a public health concern. The study aims were i) identifying knowledge, attitudes, and practices (KAP); ii) estimating the prevalence of VH regarding recommended vaccines for healthcare workers (HWs).

Methods: Multicenter cross-sectional study of an Italian sample of nurses and nursing students. Following a systematic review (PROSPERO ID:CRD42020212252), a validated questionnaire was used (Cronbach's alpha=0.82). Two multivariable logistic regression model were built to identify predictors of (1) VH to the recommended vaccine for HWs; (2) acceptance of the fourth COVID-19 vaccine dose.

Results: 226 participants were enrolled (169 nurses; 57 students). Regarding KAP: only four nurses (1.8%) had adequate knowledge among vaccine recommended for HWs, whereas 30% ($N = 66$) reported never having recommended vaccinations during clinical practice. 106 (46%) nurses/students reported VH for at least one of the vaccines recommended for HWs - high levels of VH were recorded for influenza vaccination ($N = 88$,38.9%) and fourth COVID-19 vaccine dose ($N = 100$,44.3%). At the multivariable analysis, (1) significant associations with highest levels of VH were found for nurses who reported having at least one child (OR:5.42, 95%CI: 1.64-17.89) and who had not received any dose of influenza vaccination in the last 5 years (OR:13.25, 95%CI: 5.29-33.16). Lowest odds of VH was found for nurses employed in Primary Health Care (OR:0.17, 95%CI: 0.03-0.98); (2) routinely recommending vaccinations during practice (OR:0.38, 95% CI: 0.15-0.95) was associated with acceptance of fourth COVID-19 vaccine dose. Conversely, reliance on social media as the primary information source seemed to be a predictor of COVID-19 vaccine refusal (OR:2.05 95% CI: 1.31-3.20).

Conclusions: Preliminary results identified predictors of VH among nurses, offering insights for organizations to effectively tailor public health interventions.

Key messages:

- High levels of vaccine hesitancy among nurses towards recommended vaccines for healthcare workers pose a threat to patient safety.
- Empowering 'educators' through focused public health interventions is essential to address factors contributing to vaccine hesitancy among healthcare workers.

Abstract citation ID: ckae144.193

International and intercultural training on the use of Art Therapy for Dementia Care

Martina Giusti

M Giusti[1], IE Vannini[1], H José[2], L Sousa[2], MH Natzik[3,4], N Persiani[1]
[1]Department of Experimental and Clinic Medicine, University of Florence, Florence, Italy
[2]Escola Superior de Saúde, Universidade Atlântica, Oeira, Portugal
[3]Faculty of Health Sciences, Osmaniye Korkut Ata Üniversitesi, Osmaniye, Türkiye
[4]Faculty of Nursing, Department of Internal Medicine, Gazi University, Ankara, Türkiye
Contact: martina.giusti@unifi.it

In 2023 more than 55 million people had dementia worldwide, with nearly 10 million new cases every year. Currently art therapy has been widely adopted in the assistance of people with dementia because of the positive outcomes in terms of reducing depressive and behavioural symptoms and of improving the patients' overall quality of life. In literature there was a knowledge gap on social and health professionals' training for being able to effectively use art therapy in relation with different origins of people with dementia in a multiethnic world. This research aimed to assess the impact of promoting joint international and intercultural training session for social workers and health professionals' students. The used methodology was a prospective research-intervention study with the conductions of two seasonal schools (Florence - Italy in July and Ankara - Tukey in October 2023) on the use of art therapy in the different stages of dementia disease within the Erasmus+ Project DementiaCare (2021-1-TR01-KA220-HED-000027648). Each seasonal school was attended by 25 students from Italy (5), Portugal (5), Slovenia (5), and Turkey (10) to ensure an international and intercultural approach. Pre- and post- test results showed the increased knowledge of students on the theoretical notions on dementia care and art therapy. Positive opinion on the projects developed by mixed group of students (with representants of the 5 involved universities) manifested the enforcement of their relational competences and skills mutually adapting their way of doing and communication register to the multi-ethnic and multi-cultural group's needs. Evidence showed how mutual knowledge among social and health professionals with different cultures and their joint training allowed these professionals to be able to provide an integrated and effective assistance to every patient with dementia, personalizing assistance according with their different traditions and historical memories.

Key messages:

- Art therapy has been adopted as non-pharmacological approach in dementia care to mitigate progression of symptoms' severity, serving as alternative tool for self-expression for patients.
- Conducting joint international and intercultural training sessions for social and health professionals in art therapy enabled them to develop a respectful, multi-ethical approach to dementia care.

Abstract citation ID: ckae144.194

Primary care nurses' readiness to promote digital health technology use among patients

Lotta Virtanen

L Virtanen[1], E Kainiemi[1], T Vehko[1], T Heponiemi[1], A M Kaihlanen[1]
[1]Department of Public Health and Welfare, THL, Helsinki, Finland
Contact: lotta.virtanen@thl.fi

Background: Digital health technologies (DHTs) aim to optimise resource allocation and improve public health outcomes as care supplements. However, many patients do not access them independently. Nurses, as central contacts for primary care patients, can integrate digital health assessments, patient portals, remote monitoring, and teleconsultations into practice. Insight into their readiness to promote patients' use of DHTs is important for efficient dissemination strategies. We examined nurses' referral of patients to use DHTs and whether digital dedication (enthusiasm, inspiration, and pride for DHTs) and service guidance skills were associated with referral behaviour.

Methods: In spring 2023, the national '2023 survey on information systems for registered nurses' gathered data from 549 nurses in Finnish primary care, comprising registered nurses (62%) and public health nurses (38%). The outcome, frequency of nurses' DHT referrals, was assessed on a scale ranging from never to daily. We used multivariable ordinal logistic regression to examine associations, adjusted for career length, unit, and location.

Results: Among the nurses, 31% never or seldom referred patients to DHTs, while 19% did so monthly, 32% weekly, and 18% daily. Multivariable model showed that with each one-point increase in digital dedication (scale 1-5), the odds of referring patients to DHTs more frequently increased by 43% (OR = 1.43, 95% CI 1.21-1.70). Nurses who rated their service guidance skills as good (OR = 1.76, 1.01-3.05) or excellent (OR = 2.89, 1.28-6.62) had greater odds of referring patients to DHTs more frequently compared to those with less advanced skills.

Conclusions: Referring patients to DHTs is not a common practice for primary care nurses and can undermine care equity. Nurses' motivation and knowledge about DHTs should be fostered, which may enhance patient referrals. Developing guidelines to assess patients' digital capability and needs for effective service coordination is paramount.

Key messages:

- Digitally committed and service-aware primary care nurses may refer patients to use DHTs more often than their peers, but we could not consider if suitable DHTs were available for patients encountered.
- Nurses should be motivated to use digital tools and provided with instructions for proficiently coordinating services in order to address patients' underutilisation of DHTs and promote equitable care.

4.A. Skills building seminar: Waves of community health engagement and governance: innovating through a design-as-policy approach

Abstract citation ID: ckae144.195

Organised by: EUPHA-PHPP, European Observatory on Health Systems and Policies, Portuguese National Health Council (Portugal)
Chair persons: Marleen Bekker (EUPHA-PHPP), Dheepa Rajan (Belgium)
Contact: marleen.bekker@wur.nl

In this workshop we will engage our participants in a practice oriented exercise to experiment with a collaborative design-as-policy approach for a community health action plan. The exercise will be based on the lessons learned in two large evaluation projects: 1) an

8-year evaluation of the Dutch All about Health (AaH) platform of social health initiatives on the local, regional and national level; and 2) a comparative multiple case study, including Portugal, building a framework for sustainable citizen engagement, published in the WHO Handbook ‘Voice, Agency, Empowerment: The Handbook on Social Participation for UHC’. Both projects show striking similarities in findings, and developed guidance for devising collaborative action through (a) the use of community platforms, (b) concrete engagement mechanisms and (c) mediating civil society organizations. These will be brought together in a Guidance Tool that participants will work with in the exercise. The aim of the tool is to support initiatives to bring together both top-down participatory efforts and bottom-up grassroots movements in order to anchor community and minority voices into policy decision-making for a more level playing field for policy influence. The aim of the workshop is to let participants experiment with the Guidance Tool and develop collaborative design-as-policy skills.

The outline of the skills building exercise: 1. Group introductions using Mentimeter and invitation to pick a particular complex health issue from participants’ own work or community setting (5 mins). 2. Three pitches on the projects, the Portugal case and the Guidance Tool (10 mins). 3. Exercise instructions (5 mins). 4. Exercise (35 mins) a. Upon room entrance participants receive a colored badge based on their professional background: public health professional/practitioner, community resident, researcher or policymaker; b. Form small sub groups of 6-8 participants with different backgrounds (2 mins); c. Introduce with key words on paper their respective complex community health issues and sub group jointly selects one issue for which most information and experience is present (6 mins); d. First round in duos within sub group: participants work through the guidance steps to an initial idea for the collaborative action approach consisting of a community platform, engagement mechanisms, and mediating civil society organizations, drawn out on paper (10 mins); e. Second round in duos within the sub group: duos review another duos initial design idea and conduct an intuitive SWOT analysis of feasibility, acceptability, and practicability (8 mins); f. Third round in sub group: compare the three proposals in SWOT perspective, select the most salient one, and improve with strong elements from other proposals (8 mins); g. Summarize in key words the final proposal and enter into Mentimeter. 5. Plenary wrap up using Mentimeter: select the winning proposal, and evaluate the exercise (5 mins).

Key messages:

- Collaborative action is enhanced considerably through (a) the use of community platforms, (b) concrete engagement mechanisms and (c) mediating civil society organizations.
- The Guidance Tool offers concrete steps for designing a reflexive and adaptive structure and process for community collaborative action and self-governance.

4.B. Round table: Closing the loop in the European Health Data Space: relation between primary and secondary data use

Abstract citation ID: ckae144.196

Organised by: EIT Health
Chair persons: Cristina Chiotan (Belgium), Monica Åberg Yngwe (Sweden)
Contact: cristina.chiotan@eithealth.eu

Currently, data collection processes in healthcare institutions across Europe remain exclusively geared towards the needs of primary use. Neither medical professionals’ clinical workflows, nor the data infrastructures and data management processes established within different organisations allow for the kind of highly standardised and structured data collection, processing and segregation from operational systems that secondary use requires. The development of a European Health Data Space offers large possibilities for research and innovation. High quality or primary data and secure pathways are required for the secondary use of data. Closing the loop and making relevant information from secondary use of data available to clinicians and health care professionals is a crucial step to build trust and enable a cultural shift that will enable health innovations and targeted treatments reach all those who could benefit from them without delay. Closing the loop between primary and secondary use of data will accelerate the shift from treatment of illness to prediction and prevention in the way healthcare is delivered - a shift that will need to be accompanied by an overhaul of European health systems’ current funding and reimbursement models. Establishing trustworthy sources of information and guidance for the use of novel health technologies, as well as involving patients and their caregivers early in the development of concrete applications, could help to foster better understanding and build trust in this area. To ensure acceptance, it will be particularly important for these developments to be driven by identified problems and defined needs in healthcare. Efforts should be made to address and include all parts of the population, not just the highly engaged and usually highly educated patients who typically participate in collaborative initiatives. The workshop will provide a holistic understanding of the interconnectedness between primary data and secondary use of health data. High quality of data and secure pathways are required for the secondary use of data. The workshop will explore paths for the evaluation of data-driven innovation and its introduction into clinical pathways that need to be further developed and standardised across the EU and the role that different actors in the health data system must play to meet the needs for secure and high-quality of data for research and policy development. The importance of actors like healthcare professionals, patients and citizens as well as the role of industry, public-private partnerships and relevance of health data innovative solutions will be addressed by each of the panellists and collaboration pathways for closing the loop will be further explored. The discussion will use and build on the findings and solutions identified in the EIT Health Think Tank report ‘Implementing the EHDS across Europe’.

Key messages:

- In order to move to a data sharing environment, a cultural shift is needed to foster an environment of equality and openness to share data.

- Healthcare professionals, patients and citizens are active participants and public-private partnerships could be instrumental to foster novel solutions and trust in this cultural transformation.

4.C. Scientific session: Navigating through complex challenges of responding to outbreaks of multidrug-resistant organisms

Abstract citation ID: ckae144.197

Organised by: RIVM (Netherlands)
Chair persons: Aura Timen (Netherlands)
Contact: tessa.langeveld@rivm.nl

Antimicrobial resistance is one of the top ten global public health threats according to the WHO, contributing to millions of deaths each year. While outbreaks of multidrug-resistant organisms (MDROs) are well studied in hospital and nursing home settings, knowledge gaps exist concerning the complex challenges of outbreaks of MDROs among vulnerable patient populations, such as patients with intellectual disabilities or elderly patients living longer at home with multiple comorbidities. The coordination of such outbreaks requires a multidisciplinary approach as these patients often receive care throughout different healthcare settings, including long-term care and home-based nursing care. We delve into the complexities of coordinating an MDRO outbreak response involving healthcare professionals from various healthcare settings. The challenges inherent to the coordination of multidisciplinary involvement and the use of innovative strategies for outbreak preparedness and surveillance, will be thoroughly examined based on scientific evidence and practice based experiences.

Workshop objectives:

- To exchange experiences on managing cross-institutional outbreaks of MDROs
- To foster deeper understanding of the complexities of multidisciplinary involvement during MDRO outbreaks among vulnerable patient populations

The workshop structure:

- A brief introduction will be provided on the generic challenges in providing long-term care to vulnerable patient populations carrying MDROs. We will subsequently illustrate potential challenges faced during a cross-institutional MDRO outbreak among these patients through a realistic scenario (5 min): A patient with severe intellectual and physical disabilities living in both a long-term care facility as well as with family at home, unexpectedly turns out to be carrying an MDRO after recent hospital admission. As the patient receives nursing care from both from family members and nursing staff in different healthcare settings, a cross-institutional MDRO outbreak has occurred requiring a coordinated response.

- Hereafter, individual presenters will address evidence- and experience-based challenges faced in MDRO outbreak responses within the specific healthcare settings covered in the previously presented scenario. We will navigate through the scenario together with the participants, discussing practical and ethical dilemmas, and explore ways for containing the MDRO outbreak while maintaining effective and compassionate healthcare delivery. In addition, we will discuss the use of public health innovations, such as social network analysis as a basis for the development of a stress test exercise to improve preparedness for MDRO outbreaks, and the role of wastewater surveillance in MDRO outbreaks. Discussions will be facilitated by (online) voting tools to invite participants to exchange experiences (40 min).

We conclude with an exciting quiz to summarize the key messages of this workshop (10 min).

Key messages:

- Healthcare setting, knowledge, proportionality and well-being of vulnerable patients populations are important to acknowledge during cross-institutional MDRO outbreaks.
- Novel stress test exercise and wastewater surveillance are potential methods to improve preparedness and surveillance, respectively, during cross-institutional MDRO outbreak responses.

Home-based nursing care: what do we know about multidrug-resistant organisms in this setting?

Tessa Langeveld

T Langeveld[1,3], M Haverkate[1], F de Haan[1], A Timen[1,2]

Contact: tessa.langeveld@rivm.nl

Background: The burden and complexity of home-based nursing care have intensified due to earlier discharges from hospitals and patients living longer at home with increasing co-morbidities. This growing population of vulnerable patients, combined with the worldwide increase in the prevalence of multidrug-resistant organisms (MDROs), poses a new burden on home-based nursing staff. Home-based nursing care differs significantly from hospitals and nursing homes, challenging implementation of infection prevention and control (IPC) measures. It is therefore important to gain insight into the attitudes, experiences and needs of home-based nursing staff. Also, to better understand the scope of MDRO carriage and transmission in this setting, including its challenges.

Methods: Cross-sectional studies were conducted in the Netherlands including a survey and focusgroup study among home-based nursing staff, supplemented by a report of cases of MDRO clusters.

Results: We have identified several factors adding to the complexity of responding to an MDRO outbreak with involvement of home-based nursing care. First, inapplicable recommendations in guidelines/protocols or from infection preventionists, often aimed at intramural care. Second, nursing staff questioned the proportionality of IPC measures, potentially influenced by behaviour of colleagues and patients. Third, inadequate information transfers about patients carrying MDROs. Fourth, uncertainty about the roles and responsibilities of involved healthcare professionals. Finally, the need for organisational support in providing education and sufficient resources, and clarity about financial aspects.

Conclusions: Insights from these studies have aided in aligning upcoming MDRO guidelines for home-based nursing care in the Netherlands, which factor in the above mentioned complexity. Furthermore, these findings can aid in future strategies to prevent or respond early in MDRO outbreaks with involvement of home-based nursing care.

Long-term care facilities: what do we know about multidrug-resistant organisms in this setting?

Soemeja Hidad-Nuh

S Hidad-Nuh[1,2]*, SC de Greeff*[1]*, A Haenen*[1]*, F de Haan*[1]*,*
GL Leusink[2]*, A Timen*[1,2]
[1]Centre for Infectious Disease Control, RIVM, Bilthoven, Netherlands
[2]Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, Netherlands
Contact: soemeja.hidad@rivm.nl

Background: People with intellectual disabilities (ID) are an often overlooked high-risk group for health-related issues. In the Netherlands, people with ID may reside at home, in small communities, or within long-term care facilities. This diverse living arrangement challenges the healthcare system, with responsibilities spread among multiple formal and informal caregivers. During an outbreak with multidrug-resistant organisms (MDROs), coordinated efforts should be made to prevent further spread throughout all healthcare settings. Therefore, adequate infection prevention and control (IPC) practices, are required to improve or maintain individual health outcomes. To understand the complexity of MDROs in long-term care for people with ID, it is important to gain insight into knowledge, attitudes and perceptions of involved healthcare professionals and, investigate innovative strategies that could play a role in surveillance or monitoring an outbreak within this setting.

Methods: We conduct several studies in long-term care for people with ID, using a wide scale of methodologies including a cross-sectional survey study and innovative quantitative methods, such as wastewater surveillance.

Results: We have identified several challenges in long-term care for people with ID related to IPC and MDROs. First, while IPC and MDRO guidelines exist, they lack specific context and applicability to the long-term care setting. Second, proper use of hand gloves among healthcare professionals demands increased attention as knowledge about this preventive measure seems to be insufficient. Finally, given the challenges in sample collection for MDRO screening, non-invasive strategies are needed to offer insight during outbreaks, serving surveillance or outbreak management purposes.

Conclusions: Insights from these studies could inform future strategies to prevent or respond early in case of an MDRO outbreak within long-term care for people with ID.

Preparedness for and collaboration during regional outbreaks with multidrug-resistant organisms

Berend Beishuizen

B Beishuizen[1,4]*, ML Stein*[1]*, A Tostmann*[2]*, CP Rovers*[3]*, A Timen*[1,4]
[1]Centre for Infectious Disease Control, RIVM, Bilthoven, Netherlands
[2]Department of Medical Microbiology, Radboud University Medical Center, Nijmegen, Netherlands
[3]Department of Internal Medicine, Radboud University Medical Center, Nijmegen, Netherlands
[4]Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, Netherlands
Contact: berend.beishuizen@rivm.nl

Background: Outbreaks with multidrug-resistant organisms (MDROs) are a significant burden on the healthcare system and the wellbeing of affected patients and carriers. Cross-institutional MDRO outbreaks require a concerted multidisciplinary effort for effective outbreak management. This presents challenges regarding cooperation, coordination and communication between stakeholders. In this study, we investigate collaborative structures and coordination roles in Dutch outbreak response networks and how Dutch healthcare professionals engage in preparedness activities relating to MDRO outbreaks. These findings form the basis for the development of a stress test exercise for improving professional and organizational collaboration and coordination during MDRO outbreaks.

Methods: Using a mixed-methods design, an online survey and qualitative interviews are conducted among healthcare professionals in two healthcare regions in the Netherlands. Social network analysis is used to gain insight in collaborative structures and brokerage roles. To investigate preparedness activities, the survey is combined with qualitative interviews to explore respondents' experiences, preferences and needs regarding preparedness activities for MDRO outbreak management.

Results: During the workshop we will show the cross-organizational network structures, the strengths and weakness of the mutual connections and provide insight in positions in networks, roles and responsibilities. Also, we provide insight in how the use of and experience with training and exercise activities, such as stress tests, contribute to preparedness for MDRO outbreaks in vulnerable patient populations.

Conclusions: This study shows how healthcare professionals from different organizations collaborate during MDRO outbreaks, and how they engage with preparedness activities. This provides valuable input for development of a stress test specific to MDRO outbreak management, and other interventions to improve outbreak preparedness.

4.D. Scientific session: From policy to implementation: Learnings around health system reforms and Universal Health Coverage

Abstract citation ID: ckae144.201

Organised by: Trinity College Dublin (Ireland)
Chair persons: Steve Thomas (Ireland), Johan Hansen (EUPHA-HSR)
Contact: farsacil@tcd.ie

In this session, the authors and audience have the opportunity to engage in discussions around health policy integrity and reform implementation. Introducing and implementing health system reform has been a perennial issue for countries around the world over the past number of decades. Recently, the introduction and implementation of Universal Health Coverage (UHC) has been of particular focus, with 193 countries committed to introducing UHC by 2030. At the same time, European countries that previously established national health systems are introducing new reforms in the hope of making their health systems more efficient and equitable. However, there are a number of challenges along the path of policy development and implementation with which all countries must grapple, and how individual countries go about reforming their health systems depends on their social, political, cultural and economic contexts. Learnings from around the world have highlighted that reforms can be challenged or stalled in both the design and implementation phases. This workshop, which conceptualises implementation as the "acid test" of a policy, thus explores, through three case studies, the factors that facilitate or challenge the implementation of reforms. At the same time, we discuss policy integrity, exploring reasons for why policies pivot away from original design and intent. Furthermore, we discuss the implications of health reform on equity, cognisant that the primary objective of this collective reform work is to reduce the financial burden of healthcare on households and improve access. The first presentation will provide the framework for audience discussions, outlining international lessons in relation to UHC reforms and equity. The second presentation will provide a snapshot of the Finnish experience of introducing a "big bang" structural reform. The third presentation highlights lessons from the Portuguese experience of primary healthcare reforms, the opportunity these offer for creating patient-centred care and the integral role that politics and governance play in the reform process. Finally, the Irish case study highlights the experiences of a High Income County attempting to introduce UHC much later than its European counterparts, and negotiations between the public and private sectors. Through this, we hope to hold the tensions and stimulate debate about policy robustness and resilience, and reform implementation. Each presenter will be given a strict deadline of 10 minutes each by the chair and then the audience will be invited to debate the problems identified and strategies proposed to discuss: (i) what are the facilitators and barriers to reform implementation, (ii) what are the factors that encourage policy integrity and change and (iii) whether greater cooperation across Europe regarding health reforms can be more effective in supporting robust health systems.

Key messages:

- For reforms to be facilitated, there must be cohesion and commitment across the political, social, economic and cultural systems, and no fragmentation across health system functions.
- As policy implementation is attempted, there is a tension between remaining true to key values and adapting to new circumstances.

Abstract citation ID: ckae144.202

Implementation as the acid test: International lessons from Universal Health Coverage reforms around the world

Liz Farsaci

L Farsaci[1]

[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland

Contact: farsacil@tcd.ie

Introduction: Health systems around the world are moving towards Universal Health Coverage, which is included in the Sustainable Development Goals. However, the journey towards UHC began decades ago, with countries in Europe introducing national health services following World War II. This was mirrored in Canada and, more recently, countries in Latin America introduced health reforms as part of broader social movements. Since the millennium, reforms have also taken place in Low and Middle Income Countries as well as High Incomes Countries. However, because the introduction of UHC often necessitates far-reaching reforms, countries face significant challenges along the path of policy implementation.

Methods: A realist review explored international experiences of introducing and implementing UHC. Embase, Medline and Web of Science were searched. Descriptive, inductive and deductive realist analysis aided the development of Context, Mechanism, Outcome Configurations, alongside stakeholder engagement.

Findings: How countries go about establishing UHC depends on their social, political, cultural and economic contexts. For reforms to be facilitated, there must be cohesion and commitment across all systems, as well as the functions of financing, governance and service delivery. This includes political support, often underpinned by legislation framing healthcare as a human right, as well as communication between stakeholders and the development of a strong primary care sector. Conversely, fragmentation across these systems and functions pose significant barriers to reform.

Conclusions: Examining international experiences of UHC reforms supports learning around the factors that facilitate or challenge implementation. These learnings empower policy makers and health system leaders by providing roadmaps for reform implementation. Finally, this research provides insights into health inequities that are rebalanced through the implementation of UHC reforms.

Big bang in the middle of a storm: Lessons from implementing health system reform in Finland

Liina-Kaisa Tynkkynen

L Tynkkynen[1]

[1]THL, Helsinki, Finland

Contact: liina-kaisa.tynkkynen@thl.fi

Introduction: Finland is often defined as a Nordic welfare state, characterised by universal access to healthcare and an emphasis on national and local politics in the governance of the system. In 2023, the Finnish health system was reformed by centralising organisation (purchasing and service delivery) to regional entities, as well as funding and overall governance to the state from 200 local organisations. The aims of the reform were to improve accessibility, decrease inequities, promote population health and curb growing costs. In the Finnish health system, as in other fields of society, we "find a huge number of very small changes, and a very small number of huge changes" (Cairney 2016). This makes the Finnish health system reform a rare opportunity to use a large-scale reform as a context for a study on reform implementation.

Methods: This research is based on document analysis and interview data collected from top regional managers. The data was analysed using a political determinants of health framework and thematic analysis.

Findings: The Finnish reforms were introduced by a left-centre government but implemented by a right-wing government with strong opposition to the reforms, which made full implementation challenging. The results highlight the importance of political commitment to implementation, demonstrate that reforms shape power relations at all levels of the health system and highlight how health system reforms are essentially about redistributions of power between different actors. The results also highlight the importance of contextual factors and suggest that large-scale reform should be treated as a system shock for which health systems need to prepare.

Conclusions: Understanding the political determinants of health and political commitment to reform is essential to implementation, as is the importance of resilience and preparedness to unexpected circumstances either due to reform-related factors or to external and contextual factors.

Towards integration of care in Portugal: Expansion of a new management model for the NHS

Ines Fronteira

I Fronteira[1]
[1]National School of Public Health, NOVA - University of Lisbon, Lisbon, Portugal
Contact: ines.fronteira@ensp.unl.pt

Introduction: In 1999, the first Local Health Unit (LHU) was created in the Northern region of Portugal to improve management, share resources and integrate care. The LHU integrated a National Health Service (NHS) hospital and primary healthcare (PHC) services located within the same geographic area and became responsible for public health activities and the provision of care. Over the next few years, 7 LHUs were created, the last one in 2012. In 2024, the government expanded this model to the entire territory, creating 39 LHUs. This research analyses the objectives, characteristics and expected outcomes of the scale-up of LHUs.
Methods: This study utilised a mixed methods approach based on the 6 Ps - Problem, People (policy stakeholders), Process (policy development), Price tag (Resource allocation), Paper (policies, laws, regulations), Programmes (policy implementation); and the political, social and economic setting of the Policy Circle Framework.
Findings: A 2015 assessment revealed that LHUs did not differ from non-LHUs in terms of access, waiting times, clinical excellency, patient safety or patient centeredness. The degree of integration of care in LHUs seemed lower compared with non-LHUs. However, there was no systematic evaluation of the creation of the first LHU. Despite this, the government announced the intention to expand LHUs to the entire national territory, which culminated with the creation of 39 LHUs in 2024 to deliver integrated care, with an emphasis on the proximity and continuity of health services and promotion.
Conclusions: Despite the existing knowledge gap on the impacts of LHUs in health outcomes and management efficiency, LHUs can provide opportunities to advance integrated and patient-centred care and develop strategies for managing scarce resources, including the health workforce. Nevertheless, the integration of hospitals and PHC can threaten the centrality of primary health care both in terms of delivery of care and resource allocation.

Abstract citation ID: ckae144.205
Reform of the Irish health system towards Universal Health Coverage and the role of the private sector

Catherine O'Donoghue

C O'Donoghue[1]
[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
Contact: catherine.o-donoghue@tcd.ie

Introduction: Ireland stands as a compelling case study of a High Income Country setting out on Universal Health Coverage (UHC) reforms. The Irish health system has historically been a two-tier system with a large private sector and a high proportion of the population holding private health insurance (48% in 2023). The reform programme Sláintecare, adopted as a policy direction by all political parties, aims to introduce UHC, strengthen primary care capacity, address inequitable access and decentralise decision-making. The overall aim of this study is to chart the progress of the Sláintecare reforms, from their introduction in May 2017 up to December 2023, and to explore how they have changed throughout implementation.
Methods: A document analysis was undertaken using the READ approach. Department of Health publications, Budget reports, Service Plans, National Development plans, minutes of Health Service Executive committee meetings and transcripts of the Joint Committee of Health sessions in the Irish parliament were uploaded to NVivo and a content analysis was conducted, utilising predetermined themes.
Results: Areas that have made the most significant progress include the expansion of community care and lowering of some out-of-pocket costs. Since implementation began, one approach the government has taken has been to use the private sector to fill capacity gaps in the public system. For example, strategies for reducing waiting lists and using community diagnostics have largely used the private sector. However, through using the private sector, money is taken away from building capacity in the public system, which was the original goal of Sláintecare.
Conclusions: The private sector plays a significant role in providing care in Ireland and leveraging this for the benefit of public patients could play a positive role towards UHC, provided that funding for a purchaser-providers type model for some services from the government could be guaranteed into the future.

4.E. Pitch presentations: Effects of environmental exposure

Greenness and mortality in an industrialized area in Southern Italy: a health impact assessment study

Orazio Valerio Giannico

OV Giannico[1,2,3], A Mincuzzi[1,2], L Bisceglia[3], F Addabbo[1], F Catino[4], S Minerba[5], R Sardone[1,2]
[1]Unit of Statistics and Epidemiology, Local Health Authority of Taranto, Taranto, Italy

[4]Center for One Health Research and Elaboration, Municipality of Taranto, Taranto, Italy
[5]Healthcare Management, Local Health Authority of Taranto, Taranto, Italy
Contact: oraziovaleriogiannico@gmail.com

Background: In Taranto the effects of industrial installations have been studied, but less attention has been placed on the impacts of green-oriented policies. The "3-30-300" rule states that every citizen should have 30% tree-canopy-cover in their neighborhood and not live more than 300m away from the nearest green space. In this Health Impact Assessment (HIA) study, we aimed to quantify the deaths that could be prevented in population aged $\geq$20 years by implementing this policy in Taranto.
Methods: Population weighted exposures (PWE) to green spaces (10m) were estimated using the 2022 greenest season NDVI from Sentinel-2 and the 2021 ESA WorldCover within a 300m (WHO 2016) buffer. We set a tree-cover optimal target of 30% and interim targets from 10% to 25%. For each tree-cover target, we set the counterfactual exposure (CE) as the corresponding PWE to NDVI. Age-specific preventable deaths (PD) were calculated by multiplying the baseline deaths (ISTAT) by the preventable fractions (PF).

Preventable years of life lost (PYLL) were calculated by multiplying the PD by the specific life expectancy. To compute the 95%CI, we ran 100,000 Monte Carlo simulations to propagate the uncertainties of both CE and ERF to the final estimates.

Results: The PWEs to NDVI and tree-cover-proportion were 0.19 and 8.0%, respectively. For the 30% tree-cover target (currently achieved by the 1.5% of population), the CE (NDVI) and PF (%) were 0.33 (0.32-0.33) and 5.4% (4.1%-6.2%). A total of 126 (97-146) PD and 1270 (976-1474) PYLL were estimated. Three-cover, shrubland and grassland were associated to higher NDVI values, while built-up and deprivation-index were associated to lower greenness. NDVI and summer temperature showed an inverse relationship.

Conclusions: This study as a pioneering effort in Southern Italy. Providing more green space could prevent a substantial number of premature deaths in Taranto, potentially up to 5.4% by achieving a 30% tree-cover.

Key messages:

- Providing more green space could prevent a substantial number of premature deaths in Taranto, potentially up to 5.4% by achieving a 30% tree-cover.
- Built-up and deprivation-index were associated to lower greenness. NDVI and summer temperature showed an inverse relationship.

[5]Department of Judo Therapy and Sports Medicine, SBC Tokyo Medical University, Urayasu City, Japan
Contact: matsumotoyou5598@gmail.com

Background: Older adults who experience falls are at a high risk of injury and death and require long-term care. Notably, the risk of falls varies among different neighborhood environments. No prior longitudinal studies have examined the association between falls and neighborhood environment at the community level. Identifying such associations will help prevent people falling by improving their neighborhood environment. Herein, we aimed to identify neighborhood environmental factors associated with falls among older adults in Japan.

Methods: We analyzed the data of 27,346 older adults living in 416 communities who participated in the 2010, 2013, and 2016 Japan Gerontological Evaluation Study surveys. The dependent variable was the occurrence of falls in 2016, and the explanatory variables were the mean scores of each of eight community-level neighborhood environment variables, categorized into tertiles (high, middle, and low groups) in 2013. Our model was adjusted for covariates (e.g., sex, age, and socioeconomic status) using the variables from 2010. A multilevel Poisson regression analysis was performed to obtain the relative risk (RR) and 95% confidence interval (CI) between the neighborhood environment and falls. Missing variable values were supplemented by multiple imputations.

Results: Older adults living in neighborhood environments with more parks or foot paths suitable for exercise or walking had a lower risk of falling after 3 years compared to those living in neighborhood environments with fewer parks or foot paths (RR: 0.89; CI: 0.80-0.99). For the variable 'locations difficult for walking, such as hills or steps', older adults in the middle group had a lower risk of falling than those in the low group (RR: 0.94; CI: 0.88-0.99).

Conclusions: Parks or foot paths are important environmental improvements that may prevent falls. Having hills or steps in the neighborhood could be beneficial when properly integrated into the environment.

Key messages:

- Older adults with access to parks, footpaths, and challenging terrains suitable for exercise and walking, had a lower risk of falling.
- These findings could be applied in urban designs to prevent falls among older adults.

[4]Faculty of Medicine, University of Porto, Porto, Portugal
Contact: susana.m.santos@ispup.up.pt

Background: Previous studies have explored associations of exposure to natural spaces with specific adverse health outcomes over childhood. However, knowledge is lacking on its effects on multimorbidity, defined as the co-occurrence of two or more diseases in the same individual. We aimed to assess the associations between exposure to green and blue spaces, at multiple time points and through trajectories over childhood, with multimorbidity in early adolescence.

Methods: In 2388 children from the Generation XXI birth cohort, we assessed, at birth, 4, 7 and 10 years, the residential greenness through the Normalized Difference Vegetation Index (NDVI), the distance from the child's residence to the closest green and blue space, and the presence of green and blue space ($>$5,000m^2) within 300m distance from the child's residence. We identified, from birth to 10 years, longitudinal trajectories of exposure to green and blue spaces, using latent class mixed models. At 13 years, participants were classified as having 0, 1 or ≥ 2 cardiometabolic, respiratory and/or neurodevelopmental adverse health outcomes. Adjusted multinomial logistic regression models were used.

Results: The prevalence of multimorbidity at 13 years was 43%, with overweight/obesity (35%), allergies and asthma (30%), and dyslipidemia (26%) as the most common adverse health outcomes. We observed that the presence of green spaces $>$ 5,000m^2 within a distance of 300m at birth, 4, 7, and 10 years was associated with lower odds of developing multimorbidity (Odds Ratio (OR) [95% CI] 0.55 [0.32-0.95]; 0.52 [0.32-0.84]; 0.51 [0.32-0.82]; 0.51 [0.32-0.80], respectively). No other significant associations were observed.

Conclusions: Green spaces around the child's residence seem to have a protective effect on the development of multimorbidity at 13 years. These findings reinforce the importance of urban design, and the creation of green spaces close to residential areas to optimize health across childhood and adolescence.

Key messages:

- The prevalence of multimorbidity at 13 years is high and worrying.
- Increasing accessibility to green spaces might decrease the risk of multimorbidity in adolescence.

Abstract citation ID: ckae144.209
Long-Term exposure to NO2 and Stroke Mortality in Portugal: an ecological study from 2001 to 2021

João Morgado

J Morgado[1,2], C Martins[1,3], R Martins[2], B Jardim[2]
[1]Department of Occupational and Environmental Health, NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
[2]Unidade de Saúde Pública, Unidade Local de Saúde da Região de Leiria, EPE, Leiria, Portugal
[3]Comprehensive Health Research Center, NOVA University Lisbon, Lisbon, Portugal
Contact: johnymorgado@gmail.com

Background: Air pollution is an important contributing factor for many pathologies, including stroke. Nitrogen dioxide (NO2), an air pollutant, has been associated in multiple studies with strokes' mortality.
Aim: This study aims, for the first time, to estimate the number of deaths by stroke due to long-term, ambient exposure to nitrogen dioxide in Portugal for the years 2001-2021.
Methods: An ecological study was considered, including data for NO2 outdoor concentration from Portugal. Mortality data by stroke was obtained divided in 5-year groups. It was also obtained life expectancy for each year to calculate the years of life lost (YLL). The hazard ratio (HR) was obtained from literature (1.009, CI 1.003-1.016). The population attributable fraction (PAF) of YLL by stroke due to ambient NO2 long-term exposure was calculated.
Results: The annual average NO2 concentration in Portugal decreased from its peak in 2001 of 29.4 to 12.2 μg/m3 in 2021. The YLL by stroke decreased from an estimated 57452 to 31204 from 2001 to 2021. The PAF of YLL by stroke due to ambient NO2 long-term exposure reached its peak in 2001, when an estimated 5.2% of all the YLL by stroke, corresponding to 3029 YLL, were due to NO2 exposure and a bottom in 2021, when 2.2%, corresponding to 682 YLL, where due NO2 exposure.
Conclusions: The policies and legislation implemented to curb down NO2 seem to have had an effect in Portugal. A reduction in NO2 emissions was achieved, having a significant impact on YLL by stroke in Portugal, suggesting that curbing the NO2 emissions down had a positive effect on mortality by stroke in Portugal. To further enhance our knowledge on the real impacts of NO2, further studies must be conducted to estimate the morbidity associated with NO2 on stroke as well as in other diseases.
Key messages:
- Pollution by nitrogen dioxide decreased significantly from 2001 to 2021.
- Around 20000 years of life were lost just in Portugal due to nitrogen dioxide between 2001 and 2021.

Abstract citation ID: ckae144.210
Burden of disease due to road traffic noise in Flanders, Belgium

Arno Pauwels

A Pauwels[1,2], EM De Clercq[1], C Demoury[1], B Devleesschauwer[2,3]
[1]Chemical and Physical Health Risks, Sciensano, Brussels, Belgium
[2]Epidemiology and Public Health, Sciensano, Brussels, Belgium
[3]Veterinary Public Health and Food Safety, Ghent University, Merelbeke, Belgium
Contact: arno.pauwels@sciensano.be

This study estimates the disease burden of ischemic heart disease (IHD), stroke and diabetes mellitus attributable to road traffic noise in the Flemish Region (Belgium) for the year 2020, expressed in disability-adjusted life years (DALYs). The research proposes an approach to stratify population exposure to noise according to age and sex, which allows to examine internal differences in noise burden related to both varying risk and baseline burden. Stratification of population exposure to noise is achieved by (1) linking modelled noise exposure to age- and sex-stratified population data at small area-level, (2) dividing the prevalence in each exposure class proportionally over the strata, and (3) aggregating the small areas to a Flemish total per stratum. Annual day-evening-night level exposure is translated into the fraction of attributable burden relying on relative risks (RR) from the WHO's Environmental Noise Guidelines and more recent studies. Baseline burden for the three outcomes is sourced from the Belgian National Burden of Disease Study. The lower and upper bound of the RR's 95% confidence interval (CI) are used to calculate the uncertainty range on the burden estimates. The total noise DALYs estimated are 1092 (95% CI: 135, 2061) for IHD, 761 (379, 1017) for stroke, and 671 (486, 918) for diabetes. Noise burden rates rise steeply with age for all outcomes, although the wide CIs on the IHD estimates prevent to ascertain a significant trend. The IHD burden is twice as high in men as in women, while both sexes are almost equal for the other outcomes. The variations between age and sex groups are largely explained by differences in baseline burden, as exposure is fairly constant across strata. This study estimates age- and sex-stratified disease burden attributable to noise traffic in Flanders, Belgium. As differential exposure between the population subgroups is limited, any variation in noise DALYs is mainly related to stratum-specific baseline burden.
Key messages:
- Road traffic noise is responsible for hundreds of healthy life years lost in Flanders, Belgium.
- The noise burden for stroke and diabetes rises sharply with age, and the burden for ischemic heart disease is twice as high in men as in women.

4.F. Scientific session: Progress in assessing climate change risks to health and implementation in UK and Europe

Abstract citation ID: ckae144.211

Organised by: NIHR Health Protection Research Unit in Environmental Change and Health (UK), EUPHA-ENV
Chair persons: Marija Jevtic (EUPHA-ENV), Grace Turner (UK)
Contact: grace.turner@lshtm.ac.uk

Climate change poses one of the greatest threats to health security. Climate change is increasing the frequency and intensity of environmental health threats like flooding and heatwaves and is creating conditions which heighten the risks from infectious diseases. Whilst everyone will be at some risk from adverse health impacts from climate change, the impacts will vary at individual level and the most disadvantaged both here in the UK and around the world will be disproportionately affected. Many of the anticipated adverse health impacts of climate change in the UK are still avoidable through mitigation and adaptation and that there are other benefits to health to be gained, therefore rapid action is critical to avoid the most severe potential scenarios. The Health Protection Research Unit in Environmental Change and Health, funded by the National Institute of Health Research, provides multi-disciplinary research to support decision-making relating to the impacts and responses to environmental changes that affect human health and well-being in the UK and beyond. In this workshop we present the results of recent research on the progress in assessing climate change risk factors on health in the UK and review the evidence on implementation of mitigation and adaptation measures in Europe. The workshop aims to support evidence translation for climate action that prioritises health protection and equity. The workshop will include presentations on reviewing risk assessment methods for quantifying health impacts across Europe as well as analysing the effects of fuel poverty on cold-related mortality. We present results from an analysis of primary care data to identify individual level characteristics associated with increased risk of mortality during heatwaves. Furthermore, we review national food-based dietary guidelines across Europe and South America to determine how environmental sustainability is being integrated to benefit health. The workshop will comprise 4 -5 oral presentations and we will then open the floor to have a wider facilitated discussion about what are the evidence needs for UK and European policy to further address climate risks to health.

Key messages:

- The progress in assessment and understanding of risks from climate change on health is improving.
- The health risks we face from climate change will not be distributed equally across the UK and Europe.

Background: Climate change poses significant risks to health and health systems. The European Union climate adaptation strategy sets out the pathway to become climate resilient by 2050 and supports the development of adaptation strategies across all levels of governance. Whilst many European countries have published climate change risk assessments (CCRA), it is unclear to what extent health outcomes have been quantified or prioritised. There is a need to improve methods for CCRA methods to support decision making on adaptation and better quantify future impacts on health. The aim of this study is to review the methods used in national CCRAs for impacts on health and health systems in the WHO European region.

Methods: National and European level CCRAs were identified from national government websites and European document databases e.g. Climate-ADAPT. The most recently published CCRA from each country was included. Data extracted from CCRAs included climate scenarios used, modelling data, outcomes, types of evidence evaluated, stakeholder involvement, health information, methods for prioritization of adaptation options and urgency scoring. Data extracted from each document was grouped by climate risk or outcome.

Results: Nearly all WHO EURO countries have conducted a formal assessment of climate risks and over half specifically include risks to health. All countries assessed the urgency to adapt to heat and flooding however, less than half consider the health related risks related to disrupted water supply and quality as well as impacts on food supply and security. The key reported health outcomes identified across countries were mortality, infectious disease, chronic diseases and mental health.

Conclusions: There is varying progress in the quantification and prioritization of health risks from climate change across Europe. To support better public health decision-making, CCRAs should integrate sub-national and local information for targeted adaptation action.

Contact: kai.wan@lshtm.ac.uk

Cold temperatures have been widely acknowledged as an important burden of poor health in many parts of the world including the UK. Although the temperature is expected to increase in the future due to climate change, the latest UK Health Effects of Climate Change (HECC) report projected that the number of cold-related deaths in the UK is expected to be more than 2 times of heat in the 2070s even under a high emission climate change scenario (RCP8.5). Therefore, it is still imperative to take intervention to reduce the health impacts of cold. People spent more than 90% of their time indoor and hence being able to stay in warm homes is crucial for reducing the impact of cold. However, some people may not be able to warm their home enough, a problem known as fuel poverty. Multiple factors can contribute to fuel poverty, including low income, poor housing performance, high fuel price as well as competing interest in fuel consumption and other essential living expenses. These challenges have been witnessed markedly during the cost of living crisis since 2021. This research investigates the effect of fuel poverty on cold-related mortality risk in England and Wales using small areal data. The underlying contributing factors of fuel poverty are explored to study the main mechanisms. The findings can support the identification of those who may be mostly affected by fuel poverty, and hence improve policies and interventions on reducing fuel poverty and protecting the public health from low temperatures.

Contact: ross.thompson@lshtm.ac.uk

Background: A key recommended action outlined in Heat-Health Action Plans is to identify individuals at risk and deploy targeted interventions, however this is not routinely undertaken. A major contributing factor is a lack of understanding of individual-level risk factors to support an evidence-based approach to targeted prevention.

Aim: To use electronic health data to identify individual level characteristics associated with increased risk of mortality during heatwaves in England.

Methods: A time-stratified case-crossover analysis was undertaken of individual-level clinical and socio-environmental (SE) risk factors. Conditional logistic regression was used to characterise associations between temperature and the risk of death on hot days, with analysis stratified by potential risk modifying factors.

Results: Heat mortality risk was modified by a large range of chronic conditions, with cardio-respiratory, mental health and cognitive function conditions, diabetes and Parkinson's, all increasing risk. Prescribed medications also increased odds of death during heatwaves. Heat mortality risk was modified by a range of SE determinants of health investigated, with ORs increasing with age; OR differences by sex, ethnicity and living arrangement; an increasing trend in ORs by alcohol intake and body mass index, excluding the obese-3 group. Results suggest the least deprived have the lowest OR and the most deprived have the highest.

Conclusions: This study has important implications for patient medication management during heat events, incorporating heat-risk considerations into other health policies. The results also provide important evidence on the role of disadvantage in driving the inequitable distribution of climate impacts, and the need for better socio-economic data sets linked to health records. The findings highlight the importance of incorporating an assessment of individual SE circumstances when prioritising patients at highest risk during heat events.

Background: The incorporation of environmental sustainability principles into national food-based dietary guidelines (FBDGs) has gained prominence as a strategy to address both human health and environmental concerns. This study aims to identify and explore the processes and considerations to integrate environmental sustainability in food-based dietary guidelines.

Methods: Countries that have integrated environmental sustainability in FBDGs since 2016 were identified from the UN FAO website. Background documents and interviews with key stakeholders involved in the development of FBDGs from case study countries (The Netherlands, Denmark, Chile, France and Belgium (Flanders)) were thematically analysed using the Framework Method. A coding framework explored the rationale for integration, data sources and analysis methods, stakeholder and expert engagement, synergies and trade-offs, translation into public messaging, and key learnings.

Results: Eight background documents and six interviews were analysed. Approaches to integrating environmental sustainability varied, from inclusion in dietary modelling optimisation to changes to consumer messaging. Nearly all countries adjusted guidelines to reduce red and processed meat and emphasise the role of plants in diets. However, issues of cultural significance, affordability, and access limited ambitions to reduce overall meat intake. Novel plant-based alternatives remain contentious due to concerns about their ultra-processed nature and potential nutrient inadequacies as substitution foods. Key barriers to integrating environmental sustainability into FBDGs include consumer acceptance, data quality and availability, stakeholder involvement and conflict, timelines, and resource constraints.

Conclusions: Several countries have successfully integrated environmental sustainability into their dietary guidelines, but there is still variation in the integration and acceptance of FBDGs including environmental sustainability.

[4]Chemicals & Environmental Effects Department, UK Health Security Agency, London, UK
Contact: raquel.duarte@ukhsa.gov.uk

Flooding can increase the mobilization of hazardous chemicals in the environment. This scoping review provides an overview of the evidence on how flood events effect our health through chemical contamination and describes the exposure pathways to guide prevention and response measures. Flooding includes surface water flooding, coastal flooding, river flooding, storm surge, monsoon rainfall and high tide. We found 110 papers that looked at the association between flooding and chemicals in the environment, with most studies looking at heavy metals, polyhydroxyalkanoates (PAHs), and arsenic. There was a lack of information on rural populations and studies on mobilisation of pesticides. Very few studies mapped or modelled human exposures, including for high-risk populations (e.g., children), and this remains an important evidence gap. Studies considering climate change highlighted the likelihood of chemical contamination and health risks to be exacerbated. Our results highlighted new pathways by which flood events mobilise chemicals and pose risks to human health (i.e., urban runoff, industrial sources). Although found extensively in the environment, gaps were identified in the evidence for pesticides, microplastics and heavy metals. Limited studies reported response measures to address the chemical contamination linked to flooding despite the health risks likely to increase due to poor infrastructure and management measures despite the extent of contaminated land and landfill sites. A dual risk management strategy (i.e., the coordinated management of both flood-related and chemical release risks is required to address flooding events, chemical releases, and health impacts.

Contact: alessandra.maio02@icatt.it

The interaction between environmental exposures, lifestyle factors, and genetic predisposition affect individual susceptibility to chronic diseases. Personalised Prevention (PP) has emerged in the recent years as potential approach to integrate traditional public health approaches in prevention. The implementation of PP into national health systems so far has not realized its full potential due to a number of obstacles including scanty evidence from research. Within the project "PROPHET: A Map for Personalised Prevention in the Future of Healthcare", we conducted an extensive mapping of currently active research projects in the field of PP. We carried out a scoping review according to Arksey and O'Malley methodology, followed by consultations with experts in personalised medicine and prevention. We included 45 ongoing research projects on PP, of which 57.8% were funded by Horizon Europe, 35.5% by Horizon 2020, and 6.7% by Eu4Health. Regarding disease types, 40% of the projects were about cancer, 20% on cardiovascular and 20% on neurological and psychiatric diseases, followed by metabolic diseases and other chronic conditions. Overall, the EC allocated approximately €160 million to cancer personalised prevention projects, roughly double of the funding dedicated to cardiovascular, neurological and psychiatric diseases. The emphasis on cancer projects is noteworthy, with Horizon Europe emerging as the main funding programme aligned with the ongoing Cancer Mission. Regardless of the disease, most of the projects addressed primary and secondary personalised prevention research. This is in line with the limited approaches in PP in the setting of primary and secondary personalised prevention (e.g., genetic testing to identify high risk subjects for breast cancer) compared to tertiary prevention (e.g., pharmacogenomics). This comprehensive mapping underlines the EU's continued commitment to promoting PP, which is fundamental to the future of healthcare.

Key messages:

- The EC prioritises significant financial resources towards cancer personalised prevention research projects, highlighting Cancer Mission as a focal initiative in the personalised prevention field.
- European-funded projects focus on primary and secondary personalised prevention strategies. This suggest that we currently miss evidence in these areas.

Cross-national characteristics and differences in type 2 diabetes: Malta versus Luxembourg

Sarah Cuschieri

S Cuschieri[1], A Cuschieri[1], E Grech[2], H Samouda[3], M Ruiz-Castell[3,4]
[1]Faculty of Medicine and Surgery, University of Malta, Msida, Malta
[2]Mater Dei Hospital, Msida, Malta
[3]Department of Precision Health, Luxembourg Institute of Health, Strassen, Luxembourg
[4]Living Conditions Department, Luxembourg Institute of Socio-Economic Research, Esch-sur-Alzette, Luxembourg
Contact: sarah.cuschieri@um.edu.mt

Introduction: Type 2 diabetes mellitus (T2DM) is a significant global health concern, requiring a thorough understanding of its population-level features and impact. This study aims to compare the characteristics of T2DM in Malta and Luxembourg, two European nations with distinctive healthcare systems and societal attributes.

Methods: Data from national health surveys conducted in Malta and Luxembourg, encompassing various factors such as socio-demographics, medical history, biochemical metrics, and anthropometric measurements, were analysed to investigate the features of T2DM. Comparative analyses were conducted utilizing chi-square tests, independent t-tests, and multivariable binary regression.

Results: Malta (8.23%) and Luxembourg (7.82%) shared similar T2DM prevalence, with a predominance of men having T2DM. Malta exhibited a higher prevalence of obesity among the individuals having T2DM. Multivariable analysis showed no significant association between living in Malta or Luxembourg and diabetes. However, being male (OR: 1.49, CI 95%: 1.07–2.08, $p = 0.02$), an occasional smoker (OR: 2.49, CI 95%: 1.54–4.03, $p < 0.01$), increasing age (OR: 1.05, CI 95%: 1.03–1.67), and larger waist circumference (OR: 1.02, CI 95%: 1.01–1.04, $p = 0.01$) were positively associated with diabetes.

Conclusions: Understanding similarities and differences in T2DM between Malta and Luxembourg is crucial for identifying common challenges to formulate effective prevention and management strategies. Despite similar T2DM prevalence rates, notable differences in obesity rates and socioeconomic factors may contribute to disparities in disease burden. The complex interplay of numerous population characteristics underscores the importance of tailored public health interventions. This study accentuates the need for interventions and evidence-based policies to address modifiable risk factors, and advocate for cross-national cooperation to reduce the T2DM epidemic, especially in the context of post-COVID public health planning and resource allocation.

Key messages:

- Malta and Luxembourg share similar T2DM prevalence despite differences in other factors, hypothesised to be attributed to differences in risk factor profiles and health care infrastructure.
- This study underscores the necessity for tailored interventions and cross-national cooperation to address common challenges in T2DM management in the two small countries.

[4]Department of Internal Medicine, Maastricht University Medical Center+, Maastricht, Netherlands
[5]Department of Internal Medicine, Radboud University Medical Center, Nijmegen, Netherlands
Contact: r.meisters@maastrichtuniversity.nl

Background: Type 2 diabetes mellitus (T2DM) is a common chronic disease that disproportionally affects disadvantaged groups. People with a low socioeconomic position (SEP) have an increased risk of developing T2DM. Knowing the potential influence of early life on T2DM risk later in life, this study aims to examine longitudinal associations between childhood SEP and type 2 diabetes, independent of adult SEP.

Methods: Longitudinal data was used from 6,727 participants of The Maastricht Study without T2DM at baseline (participants with prediabetes were included in the study sample). T2DM status was determined by a standardized oral glucose test. Sample mean (SD) age was 58.7 (8.7) years and 55.2% was female. Childhood SEP was determined by the highest level of completed education for father and mother and a measurement for childhood income inadequacy. Adult SEP was determined by the highest completed level of education, equivalent household income and occupational position. Incident T2DM was self-reported yearly. Associations were studied annually over a 12-year period (median (IQR) 8.2 (4.9) years) with Cox regression analyses.

Results: A total of 247 participants (3.7%) without T2DM at baseline reported incident T2DM. Incident T2DM was more common in people with low childhood SEP versus high childhood SEP (4.5% vs. 2.7%, $p = 0.008$) and for people with low adult SEP versus high adult SEP (5.2% vs. 2.1%, $p < 0.001$). The impact of parental education on incident T2DM is mitigated by adult SEP. Childhood income inadequacy did predict T2DM independently of adult SEP, with a HR of 1.22 (1.01, 1.45).

Conclusions: Socioeconomic inequalities in childhood and adulthood are both predictive for incident T2DM. Experiencing income inadequacy in childhood increases the risk of developing T2DM in later life, independent of adulthood SEP. More attention is needed for deprivation in childhood and its impact on T2DM.

Key messages:

- People who have experienced income inadequacy as a child have a higher risk of developing T2DM in later life, independent of their adult SEP.
- More attention and research is needed for the impact of childhood poverty on developing T2DM in later life.

[6]Department of Internal Medicine and Oncology, Semmelweis University, Budapest, Hungary

Contact: major.david@semmelweis.hu

Background: The trajectories of anthropometric and body composition measures (important predictors of diabetes) are rarely explored before diabetes diagnosis. Our study aimed to compare trajectories of fat mass (FM), fat-free mass (FFM), body mass index (BMI), and waist circumference (WC) preceding type 2 diabetes mellitus (T2DM) to aging trajectories of individuals without diabetes during follow-up.

Methods: We used data from the Whitehall II study, a prospective cohort of British civil servants. 5-yearly BMI and WC were available for up to 20 years, while 5-yearly FM and FFM measures were available for up to 10 years. Linear mixed models with a backward timescale (from diabetes diagnosis or end of follow-up) were performed stratified by sex and adjusted for age, occupational grade, ethnicity, and lifestyle factors.

Results: A total of 1674/990 (anthropometric/body composition analysis) women (233/81 incident diabetes) and 3917/2710 men (479/217 incident diabetes) 49.81 [0.08]/60.91 [0.9] (mean [SE]) years of age at baseline were included. All outcomes were higher in cases compared to controls. Women's FM, BMI, and WC followed a quadratic increase in both groups with a faster increase among incident diabetes cases (dBMI 0.04 [0.01] kg/m2/year, dFM 0.19 [0.09] kg/year, dWC 0.2 cm/year [0.05]). FFM decreased linearly with similar slopes in cases and controls. Men's FM, BMI, and WC also showed a quadratic increase with faster increase in incident cases compared to controls (dBMI 0.03 [0.01] kg/m2/year, dFM 0.23 [0.04] kg/year, dWC 0.08 [0.02] cm/year). FFM followed a quadratic decrease in both groups with a slower rate (0.06 [0.03] kg/year) in incident cases.

Conclusions: Incident diabetes cases have higher anthropometric and body composition measures 10-20 years before diabetes diagnosis compared to controls. Furthermore, incident cases showed faster increases in these measures except for FFM that decreased during follow-up with similar or lower speeds in cases than controls.

Key messages:

- Traditional anthropometric measures do not capture the underlying changes in body composition.
- The inclusion of body composition in risk calculators may result in more precise diabetes prediction.

Abstract citation ID: ckae144.221

Diabetes, chronic respiratory and cardiovascular diseases in Germany and Europe (EHIS-3 Survey)

Giselle Sarganas

G Sarganas[1,2], R Kuhnert[1], J Baumert[1], R Thamm[1], H Steppuhn[1], J Waldhauer[1], H Neuhauser[1,2], C Heidemann[1]

[1]Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany

[2]German Center of Cardiovascular Research, Berlin, Germany

Contact: sarganas-margolisg@rki.de

Background: We examined the prevalence of major NCD groups (diabetes, chronic respiratory diseases (CRD) and cardiovascular diseases (CVD)) as well as self-rated health (SRH) and health-related limitation in everyday activities among those with one of these NCD in Germany and Europe (average of 28 European countries (EU-28)).

Methods: Data was derived from the European Health Interview Survey (EHIS-3, 2019/20). Health indicators were: self-reported diabetes, CRD and CVD in the past 12 months; SRH (very good/good vs. fair, bad, very bad) and health-related limitations in usual everyday activities for at least 6 months (severe/moderate vs. no limitation). Educational level was operationalized via ISCED-11. Analyses are age-standardized to the European Standard Population 2013.

Results: Prevalence of major NCD in Germany were statistically significantly higher than in the EU-28: diabetes 8.1% vs. 7.1%, CRD 11.2% vs. 7.9% and CVD 6.6% vs. 5.4%. Highest prevalence was observed in the lowest educational group and lowest prevalence in the highest educational group for all of these NCD in Germany as well as in the EU-28. The proportion of a very good/good SRH among people having one of these NCD was higher in Germany compared to the EU-28: for people with diabetes 35.8% vs. 31.0%, with CRD 45.6% vs. 42.9% and with CVD 25.3% vs.19.1%. The proportion of health-related limitations among those having at least one of these NCD varied according to educational level in Germany as well as in the EU-28 with a higher prevalence among people with low educational level compared to high.

Conclusions: Even though prevalence of these NCD were higher in Germany, a higher proportion of very good/good SRH for people with one of these NCD was observed compared to the EU-28. Many factors such as severity of disease, disease management and care could explain this difference. Social inequalities were present not only in the prevalence of NCD but also in health-related limitations in Germany and Europe.

Key messages:

- Prevalence of self-reported major NCD were higher in Germany while self-rated health among people having NCD was better than in Europe.
- Health equity interventions in Germany and Europe are necessary.

Impact of retirement on physical activity in older adults: a longitudinal analysis from SHARE

Giacomo Pietro Vigezzi

GP Vigezzi[1]*, P Bertuccio*[1]*, G Mosconi*[1]*, E Maggioni*[1]*, M Vandoni*[1]*,*
S Stenholm[2]*, A Odone*[1,3]
[1]Department of Public Health, Università degli Studi di Pavia, Pavia, Italy
[2]Department of Public Health, University of Turku and Turku University Hospital, Turku, Finland
[3]Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: gvigezzi@hotmail.com

Background: With ageing populations experiencing longer post-retirement years, understanding the influence of major life transitions on health behaviours such as physical activity (PA) is crucial. This study assesses how retirement affects PA levels by analysing longitudinal data from the Survey of Health, Ageing and Retirement in Europe (SHARE).

Methods: This analysis utilised longitudinal data from 2004 to 2020, categorising PA according to WHO guidelines adapted to individual-level data from successive waves of SHARE. The study examined the relative risks (RR) of being physically active, using generalised estimating equation models to compare periods before and after retirement.

Results: The cohort consisted of 8,998 individuals aged 50 and older who were employed at baseline and retired during the study period. Initially, 83.6% of participants were categorised as physically active. A noticeable decline in PA was observed post-retirement, with RR decreasing from 1.08 (95%CI 1.07-1.10) more than 10 years before retirement to 0.90 (95%CI 0.88-0.93) more than 10 years after retirement, compared to the year of retirement. Previously inactive individuals often increased their PA levels, peaking 3 to 4 years post-retirement (RR increased from 0.79, 95%CI 0.70-0.88, to 1.49, 95%CI 1.36-1.63), suggesting a temporary boost in moderate-intensity PA during the so-called "honeymoon phase".

Conclusions: Retirement can serve as a window of opportunity for enhancing leisure-time PA, particularly among those previously inactive. Sustained increases in PA are less common, highlighting the need for targeted interventions to support continued engagement in PA among retirees. The variations in PA trends suggest that interventions should be tailored to individual characteristics such as age at retirement, previous job type, and educational background to maximise public health impact. This study underscores the challenges of ensuring long-term health benefits through PA.

Key messages:

- Retirement significantly alters physical activity patterns, highlighting an opportunity for targeted health interventions.
- Longitudinal data reveals critical periods post-retirement that could benefit from public health strategies to maintain or increase physical activity among older adults.

[3]Unit for Epidemiology and Tumor Registries, IRCCS Istituti Fisioterapici Ospedalieri, Rome, Italy
Contact: gvnn.adamo@gmail.com

Issue/problem: Individuals with chronic illnesses are at a higher risk of infections and their complications. Vaccinations are crucial in reducing this risk and their integration in chronic care pathways can enhance vaccine uptake, but it requires a collaborative approach and increased awareness in care personnel, caregivers and patients.

Description of the problem: The Local Health Authority of Rome 2 (ASL Roma 2, with approx. 1.3 million residents) initiated an active promotion plan for recommended vaccinations in chronic patients in January 2023, and a Clinical Vaccinology Workbook was produced to guide healthcare workers in promoting vaccinations across various care settings. The plan aims to establish collaborative agreements with hospitals and territorial structures that manage these patients, integrating vaccination plans with clinical and healthcare pathways for a more holistic approach to chronic disease management, a model that could benefit similar populations globally.

Results: Data was extracted from administrative databases regarding vaccinations performed in 2022 and 2023 on fragile subjects, i.e., those with a marked 'risk condition', aged $\geq$18 years. The results showed that vaccine uptake was more than doubled (6675 vs. 2041; +227%). Notably, vaccinations rose among those with oncological-hematological diseases (+212%), asplenia (+185%), chronic kidney failure or on dialysis (+190%) and those with an HIV infection (+160%). Increases were also significant in other immunocompromised conditions (+194%).

Lessons: The practice underlines the importance of targeted vaccination programs within chronic care management. Collaborative healthcare frameworks can significantly improve vaccination rates, reducing the burden of infectious diseases in high-risk populations. These results underscore the potential applicability of such a model in other regions and countries, highlighting the universal relevance of integrated healthcare solutions.

Key messages:

- Collaborative, integrated frameworks between clinical and vaccination services can represent a model for increasing vaccine uptake in chronic disease patients.
- Strategic partnerships and education in healthcare settings can improve vaccination rates and contribute to more holistic chronic disease management.

Abstract citation ID: ckae144.224

Digital services as alternative for in-person visits among clients with long-term illnesses

Emma Kainiemi

E Kainiemi[1]*, L Virtanen*[1]*, A-M Aalto*[1]*, T Heponiemi*[1]
[1]THL, Helsinki, Finland
Contact: emma.kainiemi@thl.fi

Background: For individuals managing long-term illnesses and often requiring complex care across health and social care sectors, the transition to digital platforms holds considerable potential to facilitate management of one's health. This study examined factors among people with long-term illnesses associated with their perception that digital services had replaced in-person visits in health and social care.

Methods: A total of 11,012 Finnish residents with long-term illnesses necessitating regular care (56% female, mean age 56.9, SE .23) responded to a nationwide population survey between September 2022 and March 2023. The Inverse Probability Weighting method was used to correct for bias. Complex samples binary logistic regression was used to examine whether factors related to self-rated health, distress, digital skills and perceived benefits of digital services were associated with the replacement of in-person visits by digital services. The model was adjusted for age, gender, education, and urbanicity.

Results: Approximately one third (35.8%) of the respondents indicated that the use of digital services had replaced in-person visits within the past 12 months. Respondents in poor or moderate health (OR 1.17, 95% CI 1.02-1.34) had greater odds of reporting the replacement compared to those in good health. Those with proficient digital skills (OR 1.84, 1.57-2.14) and those perceiving more benefits in digital services (OR 1.56, 1.47-1.74) had greater odds of reporting of the replacement compared to their counterparts.

Conclusions: Transition to digital services could facilitate access to care for individuals with long-term illnesses perceiving their health poorer. Promoting digital skills and perceptions of benefits of digital services can significantly increase the use of digital services as substitutes of in-person visits and contribute to more efficient allocation of health and social care resources.

Key messages:

- Especially those reporting poorer health seem to use digital services as replacements of in-person visits, offering the potential to optimize resource utilization in health and social services.
- Promotion of digital skills and perceptions of the benefits of digital services could increase the use of digital services as replacements for traditional visits with health and social professionals.

[4]Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: chiara.barbati01@universitadipavia.it

Out-of-hospital cardiac arrest (OHCA) is the most time-critical and time-dependent medical emergency and is associated with low survival rates and poor neurological outcomes at the global level. This study aims at evaluating post-OHCA intra-hospital mortality risk according to patient's characteristics and emergency health service management (EMS), including level of care of first-admission hospital. We conducted a retrospective cohort study based on data from the Lombardia Cardiac Arrest Registry (Lombardia CARe), the most complete nationwide out-of-hospital cardiac arrest (OHCA) registry in Italy. Out of 12,581 patients registered from 2015 to 2022, we considered 1,382 OHCA patients admitted alive to hospital and survived more than 24 hours. We estimated risk ratios (RRs) and corresponding 95% confidence intervals (CI) of post-OHCA intra-hospital mortality through log-binomial regression models adjusted by patients' and EMS characteristics. The study population consisted mainly of males (66.6%), most aged 60-69 years (24.7%) and 70-79 years (23.7%). Presenting rhythm was non-shockable in 49.9% of patients, EMS intervention time was less than 10 minutes for 30.3% of patients, and cardiopulmonary resuscitation (CPR) was performed for less than 15 minutes in 29.9%. Moreover, 61.6% of subjects ($n = 852$) died during hospital admission. Post-OHCA intra-hospital mortality risk is 27% higher for non-shockable presenting rhythm (RR 1.27, 95% CI 1.19-1.35 vs. shockable rhythm) and 39% higher for longer CPR time (RR 1.39, 95% CI 1.28-1.52 for 45 minutes or more vs. <15 minutes, p-value for trend <0.01). Patients who accessed a secondary vs. tertiary care hospital were more frequently older, with a non-shockable presenting rhythm and longer EMS intervention time. Our findings showed that patients' outcomes are associated with intrinsic OHCA characteristics and Health System's resources are utilised as efficiently as possible.

Key messages:

- Intra-hospital mortality risk was 27% higher among OHCA patients with non-shockable presenting rhythm, net of the hospital level of care.
- Early defibrillation of shockable rhythms is associated with improved survival, so ensure timely access to defibrillators and implement education and training programs to the first CPR is pivotal.

Background: Although the greatest delays in cancer diagnosis in Latin America occur in the provider interval, little is known about related factors. This study, part of EquityCancer-LA, aims to analyse the factors influencing access to cancer diagnosis from key stakeholders' perspective in healthcare networks of Chile, Colombia, and Ecuador.

Methods: A qualitative, descriptive-interpretative study was conducted in two networks per country in 2023, using semi-structured individual interviews ($n = 114$) with a criterion sample of primary care (PC) ($n = 40$) and secondary/tertiary hospitals ($n = 44$) health/administrative professionals, managers, and policy makers ($n = 30$). Thematic analysis was performed, segmented by country.

Results: The analysis revealed interacting factors that cause cumulative delays, with differences between countries. In all, participants identified networks structural characteristics (deficits in diagnostic resources; geographical accessibility), organizational factors (long waiting times, especially after referral), and limited knowledge of PC doctors, which all lead to delayed referral. In Chile and Colombia, barriers related to care rationing/prioritization policies hampered access to tests, and in Chile, increased delays for non-prioritized conditions. Barriers related to the health system organization also emerged: in Chile, problems related to private services subcontracting and the voucher system for using them; in Colombia, the management of care by insurers (authorizations; fragmented and short-term contracting of providers); and in Ecuador, health system underfunding. The barriers mostly affected the elderly, those with low socioeconomic status, limited social support networks, and rural areas residents.

Conclusions: The results reveal significant barriers in access to timely cancer diagnosis, which can and should be addressed with specific cancer diagnosis policies and general measures that strengthen public healthcare systems and networks.

Key messages:

- Key health system factors influencing provider delays in cancer diagnosis are identified.
- Evidence is provided for the design of policies to improve timely cancer diagnosis in studied countries.

Integrated care in the Baltic states over a 5-year period: progress, challenges and future directions

Nathan Shuftan

G Scarpetti[1,2], *N Shuftan*[1,2], *K Polin*[1,2], *V Struckmann*[1]
[1]TU Berlin, Berlin, Germany
[2]European Observatory on Health Systems and Policies, Brussels, Belgium
Contact: nathan.shuftan@tu-berlin.de

Person-centered, multidisciplinary care is key to addressing evolving complex health needs. In Estonia, Latvia, and Lithuania, this pursuit of integrated care has gained momentum as an innovative approach to allocate resources more efficiently and improve patient outcomes. This study investigates the progress of integrating care in the Baltic countries from 2019 to 2024. It details key learnings, particularly for small European countries with limited resources. The Health Systems and Policy Monitor Network of the European Observatory on Health Systems and Policies undertook a cross-country study to better understand the progress in care integration in the Baltics. The Network's Baltic country experts completed a 21-item questionnaire on the adoption of integrated care reforms. Responses were analyzed to capture reform characteristics and commonalities, countries' political environments and their conduciveness to the uptake of integrated care. Country-specific experiences with the implementation of integrated care were further explored via case studies of pilot programs over the five years. The pace of implementing integrating care reforms varied in each country. Existing regulatory barriers, workforce challenges and payment schemes have impeded integration efforts across health and social care. Despite these obstacles, the political commitment to new and innovative service delivery and collaboration for chronic care management underscores an important prerequisite toward achieving more integrated and person-centered healthcare. The three case studies illustrate the hurdles that come with shifting care settings and expanding roles for some workers. Findings stress the role for integrated care to address organisational challenges in the Baltics. This study highlights innovative approaches and long-running efforts to provide multidisciplinary care for complex-needs patients and the implications of their results for broader health system adoption.

Key messages:

- Small countries like the Baltics face structural challenges in integrating care to improve outcomes and efficiency.
- Investment and innovative care approaches are key to further advancements.

Abstract citation ID: ckae144.228
Inter-regional Hospital Patients' mobility: Is co-operation better than competition?

Giovanni Guarducci

G Guarducci[1], *F Moirano*[2], *N Nante*[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Fucina Sanità, Cuneo, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: giovanni.guarducc@student.unisi.it

Background: According to Italian law, citizens are free to choose their preferred place of care across the national territory. This study aims to analyze the associations between patients' mobility between Tuscany (Italy) and other Italian regions and the complexity of Diagnosis Related Groups (DRGs) provided for these hospitalizations.

Methods: A retrospective study was conducted using 2019 Hospital Discharge Cards data of Tuscany provided by the Italian Ministry of Health. The surgical DRGs of each Major Diagnostic Categories (MDCs) were considered according to high specialty (HS) and non-high specialty (N-HS). For each MDCs, patients' attractions, and escapes to bordering and non-bordering regions with Tuscany were associated with HS and N-HS surgical discharge DRGs by using the Odds Ratio. The analysis was performed using STATA software, and the significance level was set at 95%.

Results: For Digestive Diseases, patients from non-border regions were more likely to be attracted to Tuscan hospitals for HS DRGs (OR: 1.37 95%CI: 1.08-1.74; $p < 0,05$), while for Musculoskeletal Diseases those from non-border regions were less likely to be attracted for HS DRGs (OR: 0.51 95%CI: 0.47-0.56; $p < 0,05$). For Nervous Diseases (OR: 3.08 95%CI: 2.18-4.37; $p < 0,05$), for Ear, Nose, Mouth And Throat Diseases (OR: 2.41 95%CI: 1.52-5.03; $p < 0,05$) and for Hepatobiliary And Pancreas Diseases (OR: 4.55 95%CI: 2.71-7.68; $p < 0,05$), Tuscan patients were more likely to escape to non-border regions for HS DRGs, while for Musculoskeletal Diseases (OR: 0.76 95%CI: 0.68-0.84; $p < 0,05$) they were less likely to be admitted to non-border regions for HS DRGs.

Conclusions: The results suggest the necessity of establishing mobility agreements between regions, particularly for high-specialty DRGs. In fact, the provision of mobility care economically benefits the receiving (creditor) region, which provides the medical service, but is not advantageous to the patient's region of residence (debtor).

Key messages:

- Monitoring mobility flows is critical to improve identify possible lack of supply of resources.
- There is a need to develop interregional mobility agreements to ensure better cooperation between different regional health systems.

[3]Comprehensive Health Research Centre, NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
[4]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: anamagalhaesdafonseca@gmail.com

Background: Severe mental health disorders directly affect quality of life but may also indirectly relate to physical diseases and their prognosis. We test this hypothesis for the specific case of acute myocardial infarction (AMI), postulating a longer in-patient stay and an excess in-hospital mortality among patients suffering psychiatric comorbidities (PC).

Methods: A retrospective observational study was conducted using secondary data from public Portuguese hospitals, for all patients with a primary diagnosis of AMI (12,213 patients aged 18-80, for the years 2017-18). We used linear and logistic regression to model length of stay (LoS) and in-hospital mortality, respectively. Having at least one psychiatric comorbidity was the explanatory variable, and models were adjusted for age, sex, and the Charlson Comorbidity Index.

Results: The prevalence of PC was 12.95%. The in-hospital mortality rate was significantly higher in the group with PC (4.43%, OR = 1.372, 95%CI=1.041-1.784), than in the group without PC (3,38%). Stays were significantly longer among those with PC (mean=7.69 days), compared to those without PC (mean=6.87 days; adjusted β-coefficient=0.098, 95%CI=0.056-0.141).

Conclusions: Patients with AMI and comorbid mental disorders have poorer hospitalization outcomes than those without PC. This emphasizes the importance of promoting effective management strategies for comorbid psychiatric disorder, for instance, by improving the integration of mental health care in general hospitals, and empowering healthcare professionals to recognize and manage patients with PC.

Key messages:

- Psychiatric comorbidity is related to longer inpatient stays and higher mortality risk among patients with AMI.
- Efforts to integrate mental health care in general hospitals should be maintained.

Results from the Swiss Cohort of Healthcare Professionals: Intention to stay and well-being

Isabelle Peytremann

I Peytremann-Bridevaux[1], *J Jubin*[1,2], *C Le Saux*[1], *L Roth*[1], *E Zuercher*[1], *A Oulevey Bachmann*[1,2], *I Gilles*[3]

[1]Department of Epidemiology and Health Systems, Center for Primary Care and Public Health, Unisanté, Lausanne, Switzerland

[2]La Source School of Nursing, HES-SO University of Applied Sciences and, Lausanne, Switzerland

[3]Lausanne University Hospital, Lausanne, Switzerland

Contact: isabelle.peytremann-bridevaux@unisante.ch

Background: In the context of personnel shortages and high turnover rates in the healthcare sector, the Swiss COhort of Healthcare Professionals and Informal CAregivers (SCOHPICA) seeks to understand which factors act as determinants of professionals' intent to stay in their profession and well-being, and to monitor their trajectories.

Methods: This cross-sectional study used baseline data from a prospective open cohort including any type of healthcare professionals practicing in Switzerland. They were invited to complete an online questionnaire measuring their intent to stay in their profession and well-being, several determinants of these, sociodemographic and socioprofessional characteristics, and they were able provide open comments. Standard statistical and thematic analyses were performed where appropriate.

Results: 5927 participants completed the 2022 (n = 1707) or 2023 (n = 4220) questionnaire, and 1811 left open comments. Preliminary results revealed that the main determinants of intention to stay and well-being were work-life balance, opportunities for development, and meaning of work. Moreover, nine sub-themes were identified in open comments, grouped under three main themes: 1) working hours and private life; 2) working conditions, relating to administrative work, salary, health and staffing issues, participants with a low intent to stay being overrepresented in the last two; 3) career paths, exploring employer changes or training recongnition.

Conclusions: Finding a balance between constraints inherent to the healthcare professions and professionals' social life as well as reintroducing sense at work are key aspects that policymakers should take into account to brake turnover, retain healthcare professionals and make health professions attractive again.

Key messages:

- Work-life balance, opportunities for development, and meaning of work appeared to be reasons to stay in healthcare professions.
- People thinking of leaving commented on staffing and their own health.

Agricultural activities reduce the risk of requiring long-term care among older Japanese

Hideto Takase

H Takase[1], *M Arita*[2], *N Miyai*[3], *M Kashiba*[3], *M Yamasaki*[4], *K Shiwaku*[5]

[4]Faculty of Human Sciences, Shimane University, Shimane, Japan

[5]Faculty of Medicine, Shimane University, Shimane, Japan

Contact: htakase@wakayama-med.ac.jp

Introduction: Controlling the risks that lead to requiring long-term care for the older adults is a crucial medical and socio-economic issue. This study investigated the impact of agricultural activities (AAs) on the risk of requiring long-term care.

Methods: A 5-year follow-up was conducted on 1,009 healthy individuals aged 65-80 years (mean age 72 years; 44% men) living in a rural area (Wakayama, Japan). Requiring long-term care was assessed as requiring support or nursing care (RSNC) according to the Japanese criteria. Health status including frailty and metabolic syndrome were also assessed using Japanese criteria. Work status and lifestyle habits were assessed using self-administered questionnaires. The main outcome was the probability of RSNC. COX proportional hazards regressions were performed, stratified by occupation (agricultural worker or other) or frequency of AAs (none, less than or >150 days/year), adjusted for sex, age, frailty, metabolic syndrome and household as possible confounding factors.

Results: Approximately 35% of the participants were in agriculture, forestry, and fisheries as occupation, and 78% engaged in AAs. A total of 85 participants RSNC and 39 deaths were observed during the follow-up. The cumulative survival probability did not differ according to occupation or frequency of AAs, whereas the probability of RSNC was significantly lower in participants engaged in AAs (hazard ratio 0.37 [95% CI 0.22, 0.62]; <150 days/year, 0.29 [95% CI 0.17, 0.50]; >150 days/year). Participants engaged in AAs were significantly more likely to engage in low- and vigorous-intensity physical activity, and to participate in industry and community organizations and relating events.

Conclusions: These findings suggest that AAs may promote a physically and socially active lifestyle, independent of frailty or metabolic syndrome, and reduce the risk of RSNC.

Key messages:

- Prevention of long-term care is important in the older population.
- A lifestyle associated with agricultural activities may contribute to healthy aging.

Lipids and glycemia profiles in adults: the Italian Health Examination Survey 2023 - CUORE Project

Benedetta Marcozzi

B Marcozzi[1], *C Lo Noce*[1], *A Di Lonardo*[1], *S Vannucchi*[1], *M Morello*[2], *S Bernardini*[2], *D Galeone*[3], *P Bellisario*[3], *L Palmieri*[1], *C Donfrancesco*[1]
[1]ISS, Rome, Italy
[2]Tor Vergata University Hospital, Rome, Italy
[3]Italian Ministry of Health, Rome, Italy
Contact: benedetta.marcozzi@iss.it

Background: WHO recommends monitoring glycemic and lipid profiles in the population to control and prevent NCDs. The target for glycemic/diabetes is to halt the rise within 2025 (2010 as baseline). The Italian Ministry of Health (MoH) has strengthened prevention/health promotion and supported their periodic assessment through national health examination surveys (HESs), financed by MoH-CCM and conducted within the CUORE Project.
Methods: In 2023 a new HES started including the assessment of fasting serum glycemia, total and HDL cholesterolemia and triglyceridemia. Up to now, data from random samples of residents in 7 Regions (of 20 regions) distributed in North, Centre and South of Italy and aged 35-74 years are available (687 men, 704 women). Glycemia and lipids profiles were assayed by a central lab. Elevated glycemia/diabetes (DM): glycemia $\geq$ 126 mg/dl and/or on medication. Elevated total cholesterol/hypercholesterolemia (HChol): total cholesterol $\geq$ 240 mg/dl and/or on medication.
Results: Glycemia mean level was 97 mg/dl (95%CI: 95-99) in men and 90 mg/dl (89-91) in women; DM resulted 10% (5-14) and 8% (4-12) respectively. Among those with DM, about 2 in 10 men and 1 in 10 women were unaware; about 2 and 3 of 10 were aware but not on medication, respectively. Total cholesterol mean level was 192 mg/dl (189-195) in men and 200 (197-202) in women; HChol resulted 24% (18-31) and 29% (22-36) respectively. Mean level of HDL cholesterol was 48 mg/dl (48-49) in men and 59 mg/dl (58-60) in women; mean level of triglycerides was 121 mg/dl (115-126) and 95 mg/dl (92-98) respectively. Among those with HChol, about 1 in 10 men and 2 in 10 women were unaware; about 2 of 10 were aware but not on medication.
Conclusions: Compared to 2008, these preliminary data showed a significant decrease of glycemia, total cholesterol and triglycerides means values both in men and women, as well as of DM and HChol prevalence, but improvements on their awareness and control are still necessary.
Key messages:
- In the Italian adult general population significant improvements in lipids and glycemia profiles occurred compared to 15 years ago.
- The implementation of periodic health examination surveys is important for estimating indicators based on objective measurements and for estimating awareness and control of risk conditions.

Abstract citation ID: ckae144.233
Association between a new healthcare access index and life expectancy in Japan: A nationwide study

Akihisa Nakamura

A Nakamura[1], *K Takezawa*[1,2], *E Satoh*[1,2], *K Kotani*[1]
[1]Division of Community and Family Medicine, Jichi Medical University, Shimotsuke-City, Japan
[2]Division of Advanced Transdisciplinary Science, Utsunomiya University, Utsunomiya-City, Japan
Contact: m06066an@jichi.ac.jp

Background: Access to medical institutions is crucial to healthcare systems. Japan has universal health coverage and unrestricted access to medical institutions; patients can visit any medical institution without requiring referral letters. We developed the Japan- Spatial Accessibility Scale for Medical Institutions (J-AMI) to provide integrated spatial accessibility to multiple sized healthcare institutions. We also examined the association between the J-AMI and life expectancy.
Methods: This study included 220,621 administrative census mesh blocks defined by address; 89,248 clinics and 8,181 hospitals across 47 provinces in Japan, with a total population of approximately 126 million. The road distance between the centre of each block and the nearest clinic was calculated and scored every 1 km. Hospitals were classified as secondary and tertiary hospitals based on the availability of emergency and critical care centres. Secondary and tertiary hospitals were scored every 2 and 4 km, respectively. The scores for clinics and secondary and tertiary hospitals (1-8 points each) were aggregated and scored using a mesh. The population-weighted municipal J-AMI (PWM-J-AMI) scores were calculated for each municipality. Correlations between the PWM-J-AMI scores and life expectancy by municipality were examined. Geographic information was analysed using ArcGIS Pro.
Results: Median life expectancies for male and female individuals were 81.4 years (interquartile range [IQR]: 80.9-81.9 years) and 87.5 years (IQR: 87.2-88.0 years), respectively. The median PWM-J-AMI score was 9.5 (IQR: 5.4-14.5). The PWM-J-AMI scores were negatively correlated with male and female individual's life expectancy by municipality ($r=-0.29$, $p < 0.01$ and $r = 0.18$, $p < 0.01$, respectively).
Conclusions: The results suggest that the better a region's access to medical care, the longer its life expectancy. Efficient medical institution allocation and telemedicine promotion may be essential to improving access.
Key messages:
- We developed the Japan- Spatial Accessibility Scale for Medical Institutions (J-AMI) to provide integrated spatial accessibility to multiple sized healthcare institutions, using ArcGIS Pro.
- The PWM-J-AMI scores were negatively correlated with male and female individual's life expectancy by municipality, which suggest that the better a region's access, the longer its life expectancy.

Food additive monosodium glutamate and risk of cardiovascular diseases - NutriNet-Santé cohort

Anaïs Hasenböhler

A Hasenböhler[1], *G Javaux*[1], *M Payen de la Garanderie*[1], *F Szabo de Edelenyi*[1], *C Agaësse*[1], *A De Sa*[1], *M Deschasaux-Tanguy*[1], *L Fezeu*[1], *B Srour*[1], *M Touvier*[1]
[1]EREN, Université Sorbonne Paris Nord, INSERM, INRAE, CNAM, CRESS, Bobigny, France
Contact: anais.hasenbohler@eren.smbh.univ-paris13.fr

Background: One may add monosodium glutamate (MSG) to food for its flavour-enhancing properties. However, its implication in long-term cardiovascular health is uncertain due to a lack of precise epidemiological evidence. This study aimed to investigate the associations between food additive glutamate exposures and cardiovascular disease (CVD) risk, including cerebrovascular disease (CVA) and coronary heart disease (CHD) risks in a large prospective cohort of French adults.

Methods: Participants (n = 108,932, 79.3% women, mean age=42.4 years, SD = 14.5) were 15 years old and above from the French NutriNet-Santé prospective cohort (2009-2023). We assessed dietary intakes using repeated 24h-dietary records and exposure to food additive glutamate using food composition databases and laboratory assays. We characterised associations between cumulative time-dependent continuous exposures to total glutamate, natural glutamic acid, MSG and risk of CVD, CVA, and CHD using multivariable proportional hazards Cox models adjusted for known risk factors for standardised increments of glutamate intake.

Results: During follow-up (median 7.92 years), 2397, 1113, and 1284 participants were diagnosed with CVD, CVA, and CHD respectively. Higher intakes of naturally occurring glutamic acid (HR per 3000 mg/d increment=1.08, 95% CI [1.01-1.16], p-value=0.03), food additive MSG (HR per 200 mg/d increment=1.05, 95% CI [1.01-1.09], p-value=0.03), and total glutamate (HR per 3000 mg/d increment=1.09, 95% CI [1.01-1.17], p-value=0.02) were associated with higher risks of CHD (p-value for non-linearity>0.6).

Conclusions: This large prospective cohort study revealed positive associations between exposure to the widely used glutamate food additives, especially MSG (E621) and CVD, CVA, and CHD risks.

Key messages:

- This large prospective cohort study revealed positive associations between exposure to the widely used glutamate food additives, especially MSG (E621) and CVD, CVA, and CHD risks.
- If confirmed, our findings regarding MSG could lead to a re-evaluation of the safety of these food additives by European and international public health agencies to improve consumer protection.

Abstract citation ID: ckae144.235
Overdiagnosis of lung cancer in Chinese populations

Dongchen Xie

[4]Department of Thoracic Surgery, Fudan University Shanghai Cancer Center, Shanghai, China
Contact: 22211020195@m.fudan.edu.cn

Background: Low-dose computed tomography (LDCT) has been widely-used in employee health examinations in China since 2011. This study was designed based on the Cancer Surveillance data to quantify the overdiagnosis of lung cancer due to the introduction of LDCT in Chinese populations.

Methods: This registry-based cohort study included 46,978 incident cases and 34,475 deaths of lung cancer from Pudong New Area of Shanghai, China, during 2002-2020. We calculated the age-standardized rates (ASR) and average annual changes (AAC) of mortality and overall, stage-specific and histological type-specific incidence by sex to evaluate the potential overdiagnosis of lung cancer. We further estimated the numbers and proportions of lung cancer cases attributable to overdiagnosis by sex and period based on the comparison between the shape of the age-specific curves with that prior to the introduction of LDCT in the populations.

Results: The ASR of incidence of lung cancer increased rapidly since 2011 in both men (AAC: 1.90%; 95%CI: 0.87, 2.92) and women (AAC: 4.40%; 95%CI: 3.19, 5.62), whereas the ASR of mortality declined persistently, with AAC of -0.12% (-0.64, 0.39) in men and -0.19% (-0.47, 0.09) in women. The upward trends in incidence were mainly observed in women, for early-stage cancer and for lung adenocarcinoma. Overall, the overdiagnosis rate of lung cancer grew from 22% in 2011-2015 to 50% in 2016-2020 in women. Further analysis demonstrated elevated numbers (proportions) of lung adenocarcinoma cases attributable to overdiagnosis, which increased from 182 (8%) in 2011-2015 to 827(22%) in 2016-2020 in men, and from 1,842 (85%) to 4,171 (89%) in women.

Conclusions: This registry-based cohort study observed considerable and increasing overdiagnosis of lung adenocarcinoma in Chinese men and women. Guideline is urgently needed to maximize the benefits of LDCT screening and reduce the potential overdiagnosis of lung cancer in the populations.

Key messages:

- The secular trends in incidence and mortality of lung cancer in Chinese populations demonstrated the overdiagnosis since 2011, when the LDCT was used as a part of staff health examination in China.
- Overdiagnosis of lung cancer in Chinese populations increased incrementally over time and was mainly observed among women.

Introduction: Evidence is accumulating that not all children with cancer have benefitted equally from diagnostic and therapeutic improvements and that socioeconomic conditions are also associated with prognosis - even in high-income countries where equal access to healthcare is presumed. We investigated the association between area-based socioeconomic background and childhood cancer survival in Germany with the ultimate aim to identify groups of children that may benefit from supportive interventions.

Methods: We identified all children with a first cancer diagnosis before the age of 15 years in 1997-2016 from the German Childhood Cancer Registry (N = 35,443). Based on individual residential address information (at diagnosis) we applied the German Index of Socioeconomic Deprivation as measure of area-based socioeconomic background. Using Cox proportional hazards models, we assessed the association between absolute area-based socioeconomic deprivation (AASD) and ten-year overall survival (OS) to estimate hazard ratios (HR) and corresponding 95% confidence intervals (CI).

Results: The Cox analysis (adjusted for diagnostic year, birth year and place of residence) revealed a null association for AASD and OS from all cancers combined (HR = 1.00, 95% CI 0.97; 1.03). Among children diagnosed with acute myeloid leukemia and germ cell tumors, a higher AASD (implying more severe levels of deprivation) was associated with worse survival, particularly pronounced in boys (HR = 1.18, 95% CI 1.01; 1.37; HR = 1.67, 95% CI 1.13; 2.45, respectively). The opposite was observed for childhood CNS tumours, yielding worse survival by decreasing AASD (HR = 0.93, 95% CI 0.88; 0.98) for both malignant and non-malignant CNS tumours.

Conclusions: Contrary to reports from other European countries, we found little evidence for pronounced social inequalities in childhood cancer survival in Germany based on a composite score, with inconsistent patterns across cancer types and age at diagnosis.

Key messages:

- We found little evidence for pronounced social inequalities in childhood cancer survival in Germany on the area-based level.
- Our findings indicated inconsistent patterns of social inequalities across cancer types and age at diagnosis.and age at diagnosis.

Abstract citation ID: ckae144.237
Polycystic ovary syndrome and labor market attachment in Swedish women

Vivien Boldis

V Boldis[1,2]*, J Helgertz*[2,3]*, I Grünberger*[1]*, A Cederström*[1]
[1]Stockholm University, Stockholm, Sweden
[2]Lund University, Lund, Sweden
[3]University of Minnesota, Minnesota, USA
Contact: beata.vivien.boldis@su.se

Background: Polycystic ovary syndrome (PCOS) is a common endocrine disorder in women of fertile age and is associated with several burdensome comorbidities. We use Swedish longitudinal register data to identify and compare clusters of employment trajectories among working age women, in order to investigate how PCOS affects labor market attachment.

Data and Methods: A cohort of 157,356 women born in 1975-1977 were followed annually between the ages of 30 and 39. Labor market states were constructed by combining detailed data on various types of earned income. PCOS was identified through national inpatient and outpatient registers. Sociodemographic covariates (civil status, region of origin, highest attained education, number of children) were measured at the age of 29 years. Sequence analysis was used to identify clusters of typical labor market trajectories. Multinomial logistic regression was employed to assess the associations between being diagnosed with PCOS and belonging to the identified clusters.

Results: Women with PCOS spent less time in employment and were more dependent on sickness benefits during the follow-up time than those without PCOS. Five clusters of trajectories were identified: stable employment, education into employment, labor market exclusion, continuous unstable position, long-term sickness. Compared to being in stable employment cluster, women diagnosed with PCOS were 97% more likely to experience long-term sickness (RRR (relative risk ratio): 1.97 [CI: 1.90-2.05]), and had 11% higher risk of belonging to education into employment (RRR: 1.11 [CI: 1.07-1.15]) and a 4% higher risk (RRR: 1.04 [CI: 1.00-1.09]) of experiencing labor market exclusion. The magnitude of the association increased for education into employment and labor market exclusion after adjusting for covariates.

Conclusions: PCOS can lead to disadvantaged labor market outcomes and better strategies are needed in order to prevent economic exclusion among women diagnosed with the condition.

Key messages:

- PCOS leads to disadvantaged labor market outcomes.
- Women with PCOS may experience economic exclusion.

Abstract citation ID: ckae144.238
Dementia risk factors and cognitive function in a nationwide population-based sample aged 65+

Beate Gaertner

B Gaertner[1,2]*, J Fuchs*[1]*, R Kuhnert*[1]*, H Neuhauser*[1,2]
[1]Department of Epidemiology and Health Monitor, Robert Koch Institute, Berlin, Germany
[2]German Centre for Cardiovascular Research, Berlin, Germany
Contact: gaertnerb@rki.de

Background: Cognitive function is fundamental to healthy aging and independent living. As there is no cure for dementia, prevention of risk factors (e. g. physical inactivity, obesity, hypertension, diabetes, social isolation, depression) is crucial. The aim of our study was to analyze selected dementia risk factors and their association with cognitive function in people aged 65 years and older.

Methods: Cross-sectional data from the nationally representative examination Study on Health of Older People in Germany (Gesundheit 65+) conducted between 2022-2023 by the Robert Koch Institute ($n = 1.493$; 48% women; mean age 78.8 years). Cognitive function was assessed by the Letter Digit Substitution Test (LDST), a measure of general speed of information processing, and of the Consortium to Establish a Registry for Alzheimer's Disease (CERAD) 10-word list delayed recall (WLR), a measure of memory. Weighted associations between age, sex, education, dementia risk scores and z-standardized test scores were examined using linear regression analysis.

Results: Higher age, male sex and lower level of education were significantly associated with lower z-scores in both tests (all $p < 0.001$). In separate models, all adjusted for age, sex and education, social isolation was associated with lower performance on both LDST (ß=-0.22; 95% confidence interval -0.42, -0.01) and CERAD WLR (ß=-0.21; -0.41, -0.01); depressive symptoms were associated with lower LDST z-scores (ß=-0.40; -0.67, -0.13), and physical inactivity with lower CERAD WLR z-scores (ß=-0.12; -0.24, -0.01). Obesity, hypertension, and diabetes were not significantly associated with any test.

Conclusions: Our findings from this nationwide general population study of old and very old adults show a clustering of reduced cognitive function with social isolation, symptoms of mental health impairments, and physical inactivity in old age which call for coordinated intersectoral health promotion and prevention activities.

Key messages:

- The clustering of reduced cognition with dementia risk factors calls for intersectoral health actions.
- Limitations in cognition should only be defined by age-, sex-, and education-specific norms.

Abstract citation ID: ckae144.239
Malnutrition in Guinea-Bissau: a country wide representative cross-sectional study

Carina Silva

C Silva[1,2]*, A Abecasis*[2]
[1]ULS Gaia/Espinho, Public Health Unit, Vila Nova de Gaia, Portugal
[2]Global Health and Tropical Medicine, IHMT, Universidade NOVA de Lisboa, Lisbon, Portugal
Contact: csilva.dc@gmail.com

Background: According to the WHO, malnutrition refers to deficiency, excess, or imbalance in a person's intake of energy and/or nutrients. Children under five are especially vulnerable to malnutrition. The problem is widespread, but it is particularly prevalent in West African countries, where a prevalence of 30% stunting, 6.7% wasting and 2.4% overweight was described in 2022. In this study, we aimed to evaluate malnutrition in Guinea-Bissau (GB), a low-income country in West Africa.

Methods: We conducted a cross-sectional study between May and June 2023 on a representative sample of 1608 children aged 6 to 59 months, who had access to health care in all 11 regions of GB. Nutritional status was assessed by evaluating weight for height/length, weight for age, height/length for age, and hemoglobin concentration was determined using a portable hemoglobin analyzer. Furthermore, semi-structured questionnaires were applied to children's parents, including questions on sociodemographic and

behavioral factors, such as ethnicity, parental literacy, health care, and dietary patterns.
Results: 802 boys and 806 girls were included in the study, with a mean age of 26 months. Malnutrition rates were comparable to those described in other West African countries. We found wasting rates of 8,3%, stunting rates of 24,3%, low weight rates of 17,4%, and overweight rates of 2,4% among children under five. Importantly, 55.9% of the children had anemia: 23.6% had mild anemia, 31.1% had moderate anemia, and 1.2% had severe anemia. Statistical analyses are underway to investigate factors associated with malnutrition.
Conclusions: An important challenge in global health is combating malnutrition in all its forms. The identified prevalence of malnutrition in GB is high and emphasizes the importance of developing strategies and policies with local authorities so that the Sustainable Development Goals and Global Goals of Nutrition can be achieved and health outcomes improved.
Key messages:

- Collaboration essential: researchers, policymakers, healthcare, and local authorities must unite for targeted malnutrition interventions.
- Sustainable development in GB hinges on addressing malnutrition among its children through concerted efforts.

4.K. Scientific session: The realm of the information ecosystem and its public health impact

Abstract citation ID: ckae144.240

Organised by: EUPHA-HL, -GH, -WGGE, WHO Collaborating Centre for Health Literacy, Technical University of Munich (Germany), University of West Attica (Greece), Harvard University (UK)
Chair persons: Orkan Okan (EUPHA-HL), Elena Petelos (EUPHA-HTA, EUPHA-GH)
Contact: orkan.okan@tum.de

Workshop background: As a field of science, study, practice, and policy, infodemic management has emerged during the Covid-19 pandemic but has since been emancipated and can be translated to any topic where information ecosystems play a vital role. In particular relevant to public health, infodemic managers have grown in the ranks of institutes of public health, academic institutions, UN agencies and civil society organizations, tackling outbreaks and public health issues as wide as mpox, Marburg, teen mental health, chronic diseases, seasonal influenza, Ebola and routine immunization. Aiming at improving public health strategies, they are responsible for exploring and investigating personal and organizational (health) information ecosystem, generating evidence, identifying patterns of communication and information flow, tackling the onset and distribution of circulating mis- and disinformation, better understanding information voids, and respond to citizen needs concerning information demands around emergencies.
In this workshop, we will focus on several common challenges associated with implementing whole-of-society interventions and strategies for resilience to health misinformation. Solving these challenges, which often are too big just for the health system to solve, will sometimes require creativity, out-of-the-box thinking as well as cross-disciplinary perspectives and new partnerships. Infodemics are also a global challenge that can easily cross borders, which is why country-to-country discussions of experiences by participants is encouraged-while no previous infodemic management experience is required.
Workshop objectives: The workshop will be organized as a research symposium with five speakers from infodemic management, health information, and health literacy. They will provide a solid introduction to infodemic management from different perspectives and angles.
(i) The first presentation will introduce a study on health information seeking and health literacy in midwife-led care and the modern information environment.
(ii) The second presentation will discuss how fact-checking organizations can partner within public health for a healthier internet.
(iii) The third presentation will focus on unravelling misinformation by investigating the associations between health literacy and resilience.
(iv) The fourth presentation will present a novel web-platform for credible health information and tackling misinformation.
(v) The fifth presentation focuses on the impact of misinformation on social media in the context of natural disasters.
The format of this workshop will be 5x8-minute presentations, including Q&A with the audiences, followed by a 20-minute panel discussion, reflecting the relevance of the results to public health research, practice and policy.
Key messages:

- Infodemic management seeks to quickly understand the public's information and health needs improve future public health responses, especially during emergencies.
- Whole-of-society approaches are needed to address and mitigate harms caused by infodemics by developing closer partnerships and understanding between health systems and the public.

Contact: elisabeth@sent.com

Background: This review reports on how midwives are affected by the modern digital information environment, including health misinformation, and how their knowledge or competencies assist them in navigating this for themselves and their clients, especially those who are more vulnerable and experience inequities in healthcare.
Methods: Leveraging a PRISMA-based systematic review, the project identifies the facilitators and barriers that the modern digital information environment poses to midwives and the care they provide to their clients. The search strategy of the peer-reviewed literature examines articles related to midwives and misinformation, social media, information environment, digital health, health information, migrant women and other related keywords that surface in searches. The timeframe from which published articles will be identified for possible inclusion are from Jan 1, 2020 to March 31, 2024.
Results: Both midwives and the clients they care for experience challenges in navigating the digital information environment and

addressing health-related misinformation on reproductive health and pregnancy-related topics.

Conclusions: Midwives should receive strengthened training on digital literacy to improve the care they provide to clients and help their clients navigate a confusing and rapidly evolving information environment. Through digital and in-person interactions with their clients, midwives can improve their clients' digital information, and health literacies.

Background: Health concerns, narratives and misinformation are growing in digital spaces, which makes them also a vulnerability to being hijacked by disinformation. A workshop was held at GlobalFact11, the global factchecking summit, to take a pulse among the participants on their exposure and work with health misinformation, provide a public health perspective on the role of factchecking, and equip participants with building a business case for developing health-related factchecking programmes.

Methods: A pre-summit survey of IFCN members and summit participants was conducted to better tune the design of the discussion in the workshop. The workshop included interactive polling and a discussion of case-based scenarios and real-world examples.

Results: A business case for investing into health-claim fact-checking can consider needs of public health organizations from a variety of perspectives. (1) The global health security agenda, and the politicization of health and hijacking in disinformation influence campaigns; (2) Contributing data for public health infodemic insights reports in formats that provide value to fact-checking in public health context; (3) Developing community resilience programmes by combining fact-checking with community-based interventions; (4) Building partnerships with public health organizations (for fact-checking, capacity building, community media and information literacy, research).

Conclusions: Many fact-checking organizations got involved in public health during the COVID-19 pandemic. However, they want to access more public health expertise, tools, and partnership modalities that would enable them a more sustainable effort in covering health topics, especially beyond infectious disease.

Abstract citation ID: ckae144.243

Unravelling misinformation: investigating the associations between health literacy and resilience

Rafaela Rosário

R Rosário[1,2,3], *MJ Silva*[1], *A Duarte*[1,2,3], *J Martins*[1,2,3], *S Martins*[2,4], *C Augusto*[1,2,3]

[3]Nursing Research Centre, University of Minho, Minho, Portugal
[4]ProChild CoLAB Against Child Poverty and Social Exclusion, Guimarães, Portugal
Contact: rrosario@ese.uminho.pt

Background: Resilience, the capacity to adapt to adversity, encompasses navigating challenges in health information. Despite the profound impact of health misinformation on behavior and trust in healthcare systems, effective tools to enhance resilience against misinformation remain scarce. Health literacy (HL) is pivotal for adeptly navigating information landscapes. While HL principles facilitate critical evaluation of health information, their link to resilience against misinformation has received inadequate attention. This study delves into the associations between HL and resilience to misinformation.

Methods: Within the BeE-school project, a randomized controlled trial in primary schools serving vulnerable populations, we developed a questionnaire to assess parental resilience to misinformation. Two dimensions were examined: self-regulation regarding misinformation and stress resistance to misinformation, stratified into low and high resilience categories. Parental HL was evaluated using the HLS-Q12 tool. General HL and three specific domains-health promotion, disease prevention, and healthcare management-were assessed. HL scores ranged from 0 to 100. Binary regression analyses examined the association between HL and resilience to misinformation.

Results: Parents with higher HL levels demonstrated significantly greater resilience to misinformation, with odds ratios ranging from 1.039 to 1.049 across different HL dimensions. These associations persisted after adjusting for potential confounders, including parental education and respondent sex.

Conclusions: This study highlights the potential role of health literacy in enhancing individuals' resilience to misinformation. By promoting HL, individuals can develop critical thinking abilities necessary for navigating complex information landscapes effectively. Empowering communities to critically assess health information fosters resilience to misinformation and informed decision-making, thereby advancing public health.

[3]Public Health Austria, Vienna, Austria
[4]Ärztliches Zentrum für Qualität in der Medizin, Berlin, Germany
Contact: sebastian.schmidt-kaehler@bertelsmann-stiftung.de

Background: Access to accurate health information is crucial. Despite the abundance of information online, sorting through it can be overwhelming, especially with the spread of misinformation. This poses a threat to public health and challenges health literacy. Efforts to combat misinformation are struggling due to the rapid growth of available information. We need complementary strategies, such as promoting trustworthy information sources. An initiative by Bertelsmann Stiftung, aims to counter misinformation by promoting health information from credible sources.

Methods: In 2021, the U.S. National Academy of Medicine outlined principles for identifying credible health information sources, endorsed globally by the WHO and embraced by the social media industry. However, these principles lack operationalization, leaving indicators for credibility undefined. To address this gap, Bertelsmann Stiftung, in collaboration with German experts, conducted workshops in 2023 to draft evaluation criteria. Their ongoing work, alongside initiatives by the Careum Foundation and Gesundheit Österreich GmbH will be presented.

Results: The criteria focus on structure (e.g., the expertise of providers) and process (e.g., methods for identifying relevant evidence) rather than outcome (i.e., the quality of each piece of information), and are based on the domains science-basis, transparency and legitimacy.

Mandatory and complementary criteria allow a two-step approach to identify health information providers of good quality (meeting all mandatory criteria) and excellent quality (meeting all criteria).

Conclusions: These criteria build the basis of the establishment of an international certification system and represent a crucial measure to combat misinformation and promote population health literacy. Various international partners and social platforms have already reached a strong consensus on the relevance of the project goals and expressed their willingness to deepen their efforts in this regard.

The impact of misinformation on social media in the context of natural disasters

Sonya Hilberts

S Hilberts[1]*, SMAA Evers*[1,2]*, M Govers*[1]*, E Petelos*[1,3]
[1]Department of Health Services Research, Maastricht University, Maastricht, Netherlands
[2]Centre of Economic Evaluation & Machine Learning, Trimbos Institute, Utrecht, Netherlands
[3]Faculty of Medicine, University of Crete, Heraklion, Greece
Contact: leadvantage@live.com.au

Background: Rapid dissemination of information during natural disasters plays a crucial role in managing public responses and ensuring safety. Social media can be a tool to disseminate lifesaving information but is also a ground for the propagation of misinformation. This study examines the impact of misinformation spread through social media in the context of natural disasters and explores related dynamics, effects, and countermeasures.

Methods: Cochrane and PRISMA recommendations were used for protocol development and sound reporting. Key terms related to misinformation, social media and natural disasters were used, with the search conducted in PubMed, and without time limitation for adequate capture. Only research papers in English were eligible for inclusion. Journal and article quality were considered. No restriction was imposed on country or age of target populations.

Results: Findings reveal significant influence of misinformation on public behaviour during disasters, often leading to panic and hindering effective disaster management. Specific characteristics of misinformation were identified, incl. its origins and spread mechanisms; proximity -both spatial and social- was found to be a critical factor in terms of spread and reach. Emerging evidence highlights the importance of trusted sources to effectively counter misinformation, yet response time remains a critical challenge. Technical detection of misinformation can help combat it but requires further enhancements for real-time application in diverse disaster scenarios.

Conclusions: Misinformation on social media poses complex challenges to disaster management, affecting both individual and societal resilience. Proactive communication strategies are critical, as is the development of advanced verification tools, and public education strategies to combat misinformation. Future research should focus on refining strategies to enhance disaster preparedness and response, ensuring a resilient and well-informed public.

4.L. Skills building seminar: Skills building seminar: Enhancing your elevator pitch: persuading a policymaker in seconds

Abstract citation ID: ckae144.246

Organised by: EUPHAnxt, EUPHA
Chair persons: Monica Brinzac (EUPHAnxt), Jinane Ghattas (EUPHAnxt)
Contact: monica.brinzac@publichealth.ro

Numerous public health researchers aim to influence evidence-based policymaking with their scientific discoveries. However, bridging the gap between research and policy remains a significant challenge. While researchers excel in data analysis and publishing, effectively communicating with policymakers requires additional skills. One crucial skill is the ability to succinctly present research findings, such as in an elevator pitch. In this seminar, top-scoring abstract presenters will have the opportunity to convey their work in just 60 seconds to a panel of policymakers and politicians. Through a hands-on approach, both presenters and attendees will learn, as each pitch receives immediate feedback from the panel. Are they interested? Do they remember the key message? And if all goes well, do you get an invitation to come back and present more of your work? Since several years the European Public Health Association (EUPHA) has been organising skills-building seminars on the elevator pitch. Building forward on those previous five successful and well-attended workshops, the current workshop will follow up on this series and take forward where the previous editions ended. Lessons learned at the previous elevator pitch workshops:

- Have a clear ask (keep it simple) and show enthusiasm.
- Appeal to the policymaker's own interests and priorities.
- Spell out how action will be beneficial for the policymaker.
- Be aware of upcoming elections.
- Build a relationship with the assistants of politicians.
- Consider the 'policy window'.
- Make the comparison with the policy plan.
- Propose an action the politician should undertake.
- Identify the relevant stakeholders and groups affected by the problem.

For this sixth edition we take the elevator pitch to the next level. Whereas previous editions allowed pitches up to 2 minutes, the current seminar will set the timer at 60 seconds. The previous editions showed that keeping the pitch very short was more successful. The session will be wrapped up by a key note with reflections on the pitches exercise and linking this to what the literature says about influencing healthy policy making.

Key messages:

- The elevator pitch is a useful skill to have for public health researchers to facilitate the outcomes of their research feed into health policies.
- There are numerous tools available to effectively communicate public health messages to policymakers and promote evidence-informed policy making.

Speakers/Panelists:
Charlotte Marchandise
EUPHA

4.M. Pitch presentations: Insights into mental health

Abstract citation ID: ckae144.247

Childhood socioeconomic status and depression in adulthood: systematic review

Stamatia Damianakou

S Damianakou[1], D Lamnisos[1], A Heraclides[1]
[1]Public Health, European University Cyprus, Nicosia, Cyprus
Contact: sd231107@students.euc.ac.cy

Background: Low socioeconomic status (SES) is generally associated with poorer mental health, particularly depression. We carried out a systematic review to address the question of whether childhood SES is associated with depression in adulthood and the potential pathways which may explain this association.

Methods: We followed a systematic search strategy in PubMed and Scopus with specific inclusion and exclusion criteria. After removing duplicates, studies were screened for eligibility and quality was assessed independently by two assessors using the Newcastle-Ottawa scale.

Results: After the selection process, 20 observational studies (7 cohort and 13 cross-sectional) that examine the association between SES during childhood and depression in adulthood were included in the systematic review. The most common measures of childhood SES were parental education, occupation or family income, estimated subjectively and/or objectively. In 17 of the studies an inverse relationship between childhood SES and depression was shown. In 17 studies, models were employed to demonstrate the possible pathways which explain the relationship between childhood SES and depressive symptoms. The most important mediators were adult SES, psychosocial factors, childhood trauma and physical health.

Conclusions: Our findings reveal the long-term association between childhood socioeconomic conditions and depression later in life. Suboptimal childhood SES seems to be an important risk factor for depression in adulthood. Improving childhood socioeconomic conditions can potentially have lasting effects well beyond childhood.

Key messages:

- Protecting children against the effects of socioeconomic adversity could reduce depression in adult life.
- Policy makers should direct resources towards alleviating childhood disadvantage for promoting health in adulthood.

Abstract citation ID: ckae144.248

The impacts of UK coronavirus virus job retention (furlough) scheme on mental health

Lateef Akanni

L Akanni[1,2], C Deeming[2], N Adjei[1], S Wickham[1], D Taylor-Robinson[1]
[1]Public Health, Policy and Systems, University of Liverpool, Liverpool, UK
[2]Department of Social Policy, University of Strathclyde, Glasgow, UK
Contact: akanniolat@yahoo.com

Background: In March 2020, the UK government introduced the pandemic-induced job retention scheme, known as furlough. The scheme provided grants to employers, to retain their workforce by subsidizing up to 80% of wages. While the scheme was aimed at preventing unemployment during lockdowns, it also came with wage loss, with implications for mental health for affected workers, although evidence is limited. Therefore, we aimed to explore the impact of the furlough scheme on mental health in the UK

Methods: We explored longitudinal data from the UK's Understanding Society Survey between 2019 and 2021, including nine COVID waves. We matched a sample of furloughed and non-furloughed workers using various covariates. Mental health was measured using General Health Questionnaire (GHQ-12, scored 0-36). We estimated difference-in-differences models to explore the heterogeneous causal effects on mental health of workers participation and exit from the furlough scheme. We further considered the effects of being furloughed contrasted with becoming unemployed during the pandemic

Results: The estimated average treatment effect (-0.53 [95% CI: -0.91 - -0.16]) suggests that being furloughed had significant positive impact on mental health, while exiting from furlough due to changes requiring workers to work minimum hours increased the incidence of poor mental health 0.41 [95% CI: -0.11 - 0.92]. However, compared to becoming unemployed, being furloughed improved mental health by around -0.42 [95% CI: -0.75 - -0.09] GHQ points.

Conclusions: Policies that mitigate the economic impact of the pandemic also had psychological effects on the population. Even though there were mixed effects of coronavirus-induced social restrictions and lockdowns. Furlough reduced the psychological risks associated with the pandemic job loss, while exiting the scheme increased the incidence of poor mental health. This could be explained by substantial decline in the generosity of the scheme by up to 40%.

Key messages:

- Job loss during the pandemic had deteriorating mental health effects.
- Government contribution to furloughed workers' wages minimizes the incidence of mental health distress.

Abstract citation ID: ckae144.249

Disparities in the Incidence and Prevalence of Psychotic Disorders Between With and Without Disabled

Kyoung Eun Yeob

Background: Numerous epidemiological studies on psychotic disorders have been conducted, however, most of the studies were conducted from an etiological perspective, and conducted with small sample sizes relatively few focused on all types of disabled, especially with a long observation period. Moreover, no study has included the whole adult population of a country.

Methods: This study was conducted using a data set linking the Korean National Health Insurance Service database, and disability registration data. Age-standardized incidence or prevalence rates were calculated during 2008-2017 according to the presence, severity, and type of the disability. Factors associated with psychotic disorders were examined by multivariate logistic regression.

Results: The age-standardized incidence and prevalence of psychotic disorders was higher among the disabled than among those without disabled across all years, especially those with severe disabled, and intellectual disabled. The gap in the prevalence of psychotic disorders between the disabled and the non-disabled has widened over time. The severe disabled and intellectual disabled showed the strongest associations with the incidence(aOR=3.04,95% CI = 2.93-3.15;aOR=6.18, 95% CI = 5.90-6.47) and prevalence(aOR=7.64,95% CI = 7.58-7.69;aOR=53.62, 95% CI = 53.04-54.22) of psychotic disorders.

Conclusions: The incidence and prevalence of psychotic disorders were higher in people with disabled, especially those with severe disabled, and intellectual disabled. The government must increase effort to narrow the gap between the non-disabled and disabled.

Financial support: This research was supported by the Basic Science Research Program through the National Research Foundation of Korea funded by the Ministry of Education (No. 2022R1I1A3070074, and 2022R1I1A1A01068449), and a grant of Patient-Centered Clinical Research Coordinating Center funded by the Ministry of Health & Welfare, Republic of Korea (No. HC23C016500).

Key messages:

- The incidence and prevalence of psychotic disorders were higher in the disabled, especially severe disabled, and intellectual disabled.
- Important reasons for these finding may be the 'low socioeconomic status' and 'mental health' of the disabled.

Abstract citation ID: ckae144.250

Factors Influencing Depression in People with Disabilities: Individual and Interpersonal Levels

Depression is an increasingly important social problem, and this also applies to the disabled, a health-vulnerable group. Although the distribution and influencing factors of depression may be different among the disabled population (young adults vs. the elderly, older adults with disabilities vs. disabilities due to old age), only the high prevalence of depression among the disabled is generally reported. This study seeks to determine the distribution and influencing factors of depression in disabled people according to sociodemographic standards. This study employed data from the 2021 Panel Survey on People with Disabilities (National Unit Survey) to investigate the influence of individual-level factors (health behaviors, health level, environment) and interpersonal-level factors (social network) on depression. Multivariate logistic regression analysis was performed while controlling for demographic sociological factors and disability characteristic factors. The experience of depression was among elderly disabled individuals (age 50+: 40.9%) than younger ones (age 19-49: 36.1%), and in disability with aging (49.3%) versus aging with disabilities (39.2%) ($P < 0.05$). Chronic diseases, daily living assistance, living environment, and emotional support from family and neighbors affected both young and elderly disabled individuals. Specifically, among the elderly disabled, exercise frequency (aOR=0.78; [CI]0.63-0.97), social network size (aOR=0.87; [CI]0.82-0.93), and social interaction frequency (aOR=0.68; [CI]0.51-0.91) were significant. Disability with aging was influenced by exercise frequency (aOR=0.29; [CI]0.09-0.95) and emotional support (aOR=0.37; [CI] 0.17-0.77) from peers. older adults with disabilities were affected by not only individual-level factors (exercise frequency) but also both functional (emotional support) and structural (size of social network, frequency of meetings) aspects of their interpersonal social networks.

Key messages:

- Depression experiences among older adults with disabilities are influenced by both functional and structural social networks.
- Developing depression prevention strategies for people with disabilities requires a customized approach that takes into account age-specific characteristics.

Contact: brennm32@tcd.ie

Background: In 2022, cocaine was the leading problem drug for which individuals sought treatment in Ireland, overtaking opioids for the first time. Despite increasing concerns about cocaine, there is limited longitudinal research examining factors associated with cocaine use in the general youth population. We describe levels of use and associated factors at 17 and 20 years old

Methods: Past-year cocaine use was studied at age 17 ($N = 5965$) and 20 ($N = 4679$) in a nationally representative cohort. Individual, family, social and environmental exposure variables were selected a priori. Weighted logistic regression models were fitted using Generalised Estimating Equations to multiply imputed and complete case data.

Results: Cocaine use was reported by 220 (4%) at age 17, and 1072 (23%) at age 20. Both individual and community factors predict use. Earlier alcohol initiation and having friends who use cannabis were strongly associated with increased odds of cocaine use at both ages. Those with parents who reported that neighbourhood intoxication or drug-taking was common had elevated odds of cocaine use at age 17.

Conclusions: Past-year cocaine use at 20 years old in this cohort is substantially higher than other international cohort studies. Levels of cocaine use increase significantly between 17 and 20 years old.

Acknowledgement: Growing Up in Ireland (GUI) is funded by the Department of Children, Equality, Disability, Integration and Youth (DCEDIY). It is managed by DCEDIY in association with the Central Statistics Office (CSO). Results in this report are based on analyses of data from Research Microdata Files provided by the CSO. Neither the CSO nor DCEDIY take any responsibility for the views expressed or the outputs generated from these analyses.

Key messages:

- Our study underscores significant cocaine use rates and correlations with early substance initiation and neighbourhood factors.
- This emphasizes the necessity of a comprehensive, multilevel strategy for preventing cocaine use.

4.N. Scientific session: Equity in Child Health: Leveraging Universal Health Promotion Services for Families Amid Uncertainty

Abstract citation ID: ckae144.252

Organised by: Norwegian Institute of Public Health (Norway)
Chair persons: Boye Welde (Norway)
Contact: boye.welde@fhi.no

This workshop addresses the urgent need to foster resilience and equity in child health within the context of an increasingly uncertain Europe. Rapid societal changes, exacerbated by events such as the COVID-19 pandemic and heightened risks of conflict, climate change and economic instability, underscore the importance of nurturing environments where children can thrive despite challenging circumstances. The workshop aims to explore strategies for promoting well-being and addressing social inequalities in child health within the context of universal health promotion services, such as school health services and child health clinics.

Objectives are to 1) Elucidate the importance and impact of universal health promotion services in addressing social inequalities and promoting equitable opportunities for all children, regardless of background or circumstance; 2) Identify actionable steps for interventions mitigating social inequalities and promoting equitable opportunities focusing on health literacy among parents with immigrant backgrounds; 3) Showcase successful models and initiatives in universal healthcare and health promotion services for children and families, emphasizing early intervention and standardized evaluation tools; and 4) Facilitate dialogue and knowledge exchange among professionals, policymakers, and stakeholders involved in child and adolescent health promotion.

This workshop's added value lies in its multidisciplinary approach, fostering collaboration for innovative solutions in child health resilience and equity. The coherence between presentations lies in their joint focus on addressing social inequalities in the context of universal health promotion services for children and families. Each presentation offers a unique perspective on these themes, contributing to a comprehensive understanding of the challenges and opportunities in child health promotion.

- Hanne Nissen Bjørnsen's presentation on the role of universal services in public health and addressing social inequality sets the stage by examining the structural factors contributing to disparities in child health outcomes.
- Kirsti Riiseŕs presentation conveys the importance of user, stakeholder, and community involvement in creating culturally sensitive strategies for effective health promotion services in the context of health literacy among parents with immigrant backgrounds
- Kristin Haraldstad's presentation on Starting Right, an evidence-based assessment of children in municipalities healthcare centers, highlights the importance of early intervention and targeted support in mitigating health inequalities and promoting well-being.

Format of the workshop: Three 10-minute presentations followed by a 20-minute moderated discussion to delve into empowerment and equity in child health, encouraging rich idea exchanges.

Key messages:

- Leveraging universal health promotion services effectively empowers children and families while addressing social inequalities amidst periods of uncertainty.
- Collaborative, user-centered approaches and evidence-based working strategies are key to promoting equity and building resilience in child health.

The health and well-being of children and adolescents face significant challenges, particularly in times of social instability. In response to these challenges, the Norwegian government allocated funding in 2021 to establish a national center for Child and Adolescent Health Promotion Services. Situated within the Norwegian Institute of Public Health, this center focuses on enhancing expertise, professional development, and research within municipal maternity and child health clinics, school health services, and youth health clinics. This presentation delves into the crucial role of Universal Health Promoting Services (UHPS) in mitigating the adverse effects of social inequality on child and adolescent health. By leveraging evidence-based practices and identifying knowledge gaps in health promotion and disease prevention in primary care settings, UHPS serve as catalysts for reducing health disparities and enhancing outcomes among expecting parents, children, and adolescents. Moreover, UHPS plays a vital role in addressing the underlying determinants of health inequality, including social network, lifestyle factors, promotion of health literacy and ensuring accessible health care services for all. UHPS empowers individuals and communities to actively participate in health promotion efforts, fostering a culture of health equity and resilience. Through targeted health education programs, early intervention strategies, and community empowerment initiatives the UHPS work both at a systems and individual level to address social inequality in health. This presentation contextualizes UHPS within a broader picture aimed at promoting child and adolescent health while addressing social inequality in health. By highlighting effective approaches and areas requiring further research, it aims to contribute to the ongoing discourse on optimizing health outcomes for young populations.

Research indicates that parental health literacy is associated with child health outcomes. A 2021 study by the Norwegian Public

Health Department found that certain immigrant groups struggle with health literacy due to language barriers, cultural differences in understanding of health and illness, and unfamiliarity with the Norwegian health system and services. To reduce differences in health literacy and better support parents with immigrant backgrounds to make health promoting choices for their children, and navigate the Norwegian health and social systems effectively, we need knowledge about their resources, challenges, and needs. This knowledge makes it possible to design strategies to promote parental health literacy and make health services more responsive to the needs of the population. Optimising health literacy amongst parents with immigrant backgrounds (OPAL) is a research collaboration between Oslo Metropolitan University and the Bjerke City District, one of the most culturally and linguistically diverse districts in Oslo. Applying the Optimising Health Literacy and Access (Ophelia) process, parents health professionals, and researchers work systematically together to develop knowledge of parents' health literacy, identify priority areas for research, design and implement effective solutions in primary health care. In this presentation, we will describe how OPAL is rooted in the strategic priorities of the city district, how the project applies methods for needs identification and involves users and stakeholders at all stages. We will share experiences from planning and conducting inclusive data collection, preliminary results and describe how results will be used in development of targeted health literacy actions.

During the last century, children's health has evolved significantly, with mental health issues becoming a prominent public health concern. Childhood health problems profoundly impact quality of life (QoL), development, school functioning, and social interactions, affecting society broadly. In Norway, child and school health services offer free comprehensive care within the municipal primary health care system, prioritizing health promotion and prevention to address social health inequalities. The Norwegian Starting RightTM project recruits' children aged 6 months to16 years and their parents, emphasizing early intervention and support to reduce health inequalities and promote well-being. In the Starting RightTM project, online proxy- and child-reported questionnaires are used to support public health nurses (PHNs) in assessing children's health and development in routine follow- up. Parents and children receive an SMS text message asking them to answer an online questionnaire before attending their regular appointments in child or school health services. Validated instruments measure the development (ASQ, ASQ-SE), mental health (SDQ) and health-related quality of life (HRQoL), (KIDSCREEN -27). By mapping children and adolescents' health and through discussions with PHNs, parents and children may be more involved in children's health and development and may increase their Health Literacy. The primary objective of the proposed project is to develop child and school health services and improve children's health and HRQoL. The ongoing project is the first to systematically assess development, health and HRQoL in children and adolescents in Norway through ordinary services, and to do so longitudinally. At present, >2000 children have been included. The large sample size combined with a broad multi- and interdisciplinary approach is unique from a national perspective. The upcoming workshop will showcase findings from this innovative study.

4.O. Pitch presentations: Migrant population health

Abstract citation ID: ckae144.256

Are migrant workers at greater risk of workplace deaths? A systematic review and meta-analysis

Karen Lau

K Lau[1,2], *R Aldridge*[3], *M Norredam*[4], *GF Mkoma*[4], *M Kugan*[5], *RCY Lin*[1], *L Kiss*[2], *C Zimmerman*[2], *S Hargreaves*[1]

[4]Danish Research Centre for Migration, University of Copenhagen, Copenhagen, Denmark
[5]National Health Service, London, UK
Contact: m2210868@sgul.ac.uk

Background: Globally, 170 million individuals migrate for work. Yet, evidence on their mortality risk remains unclear. Our aim was to synthesize global evidence on migrant worker mortality risk compared to local workers and to identify the multiple intersecting social determinants of mortality.

Methods: We conducted a systematic review of peer-reviewed literature which reported on mortality outcome of migrant workers. Studies published between 1 Jan 2000 to 17 Jan 2023 in English were searched in MEDLINE, Embase, PsycINFO, and Ovid Global Health. Meta-analysis using random effects model was used to calculate pooled estimates and narrative synthesis was used to develop a data-driven framework on intersectional social determinants.

Results: Out of 11,495 identified records, 44 were included, of which 11 were pooled in meta-analyses. The combined migrant worker death count was 44,338, with data from 16 countries, including migrants from agriculture, construction, and service industries. Compared to local workers, migrant workers had a higher risk of fatal occupational injury (pooled RR = 1.71, 95%CI: 1.22-2.38, $I^2 = 99.4\%$), and a lower risk of all-cause mortality (pooled RR = 0.94, 95%CI: 0.88-0.99, $I^2 = 90.7\%$). Key social determinants associated with increased mortality risk were either migration-related (e.g. lower language proficiency, undocumented status) or labour-related (e.g. precarious employment, labour migration policies) interacting over migrant workers' life course.

Conclusions: As the largest evidence synthesis to date, these findings indicate that migrant workers have higher fatal occupational injury rates than local workers, indicating the need for tailored protections for migrant workers. These data confirm that the all-cause mortality advantage observed in migrant populations applies to the working population. Future interventions should be designed to address both migration- and labour-related determinants of migrant worker health.

Key messages:

- Migrant workers have a higher risk of workplace fatality despite being generally healthier than local workers, explained by structural determinants such as precarious employment.
- Future interventions must address migration- and labour-related social determinants of health at structural levels, such as extending labour protection laws to migrant workers.

Abstract citation ID: ckae144.257
Latent tubercolosis infection in the migrant population: an Italian surveillance experience

Guido Pagliantini

G Pagliantini[1], E Montomoli[1,3], R Frazzetta[2], M Fattorini[2], C Massini[2], D Rosadini[2], E Guerreschi[1], A De Luca[4], A D' Urso[4], N Nante[1,3]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Public Hygiene and Nutrition Unit, Local Health Authority Tuscany South East, Torrita di Siena, Italy
[3]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
[4]Health Management, Local Health Authority Tuscany South East, Siena, Italy
Contact: pagliantini7@student.unisi.it

Background: The Special Reception Center (“Centro Accoglienza Straordinario” or CAS in Italian) concept was born in Italy in 2014 to receive the large number of migrants arriving in Italy. There are around 3100 centres are in Italy, of which 200+ in Tuscany. Each Center’s objective is to support migrants’ social integration through Italian language and job orientation courses. On arrival at a facility, migrants undergo diagnostic and lab tests to highlight potentially infectious diseases; among these, tuberculosis is one of the most frequently encountered. Therefore, the objective of the study is to estimate the prevalence of Latent Tuberculosis Infections (LTBIs) among migrants hosted in CAS centers.

Methods: From May-December 2023, Amiata Senese, Val d’Orcia and Valdichiana Senese Public Health Unit staff, according to national and departmental guidelines, implemented a number of health surveillance protocols, with close attention to latent tuberculosis infection. This protocol includes the Mantoux TB skin test at the CAS: in case of positivity, subjects are directed to further exams (chest X-ray, TB-IGRA blood test, infectious disease specialist consultation) in order to implement a therapy.

Results: From May-December 2023, 259 migrants (241 males and 18 females) received the TB skin tests. Average subject age was 26. Pakistan was the most represented nation of origin with 130 migrants (50%), followed by Bangladesh (9.7%) and Ivory Coast (7.3%). 77 migrants showed a positive TB skin test result (29.7%): of these 56 (i.e. 21.6% of the migrants screened) were also positive to the TB-IGRA blood test and treated for LTBI.

Conclusions: The high prevalence of LTBIs found in the referenced CAS indicates the need to continue/extend these surveillance protocols. Implementing successfully this procedure requires the involvement of a range of professionals from the socio-health sector within a process necessarily coordinated by the Disease Prevention Department.

Key messages:

- Screening and surveillance of infectious diseases among migrant population represent a major public health issue for European health systems.
- Detection and treatment of Latent Tubercolosis Infections require a multiprofessional and integrated approach, coordinated by the Disease Prevention Department.

Abstract citation ID: ckae144.258
Primary health care models for refugees and the involvement of nurses: A systematic review

Andreas W Gold

AW Gold[1,2], C Perplies[1,2], L Biddle[1,2], K Bozorgmehr[1,2]
[1]Section Health Equity Studies & Migration, Heidelberg University Hospital, Heidelberg, Germany
[2]School of Public Health, Bielefeld University, Bielefeld, Germany
Contact: andreas.gold@med.uni-heidelberg.de

Background: Primary health care is key to address the health and social needs of refugees. Nurses are often part of multidisciplinary teams in primary health care, but little is known about their roles and responsibilities in refugee health. Our systematic review aimed to synthesise the existing knowledge about models of care (MoC) for refugees in primary care settings and the involvement of nurses in these models.

Methods: We searched PubMed, CINAHL and Web of Science for literature published in English, Spanish, French and German. For grey literature, we additionally searched Google Search and Scholar, Microsoft Bing and DuckDuckGo. Eligible publications reported on MoC for refugees in a primary care setting and the involvement of nurses. We extracted and synthesised information about the structure of these models as well as the roles and responsibilities of nurses within these.

Results: 112 publications met our inclusion criteria. Our narrative synthesis focuses on 61 publications with in-depth insights into existing MoC and nurse involvement. We identified 45 MoC, mainly originating from high-income-countries and with almost a third from Australia. The majority of MoC set up a parallel health care structure that refugees could access for a limited period of time. In most MoC, the role of the nurse is described with a relatively high degree of autonomy and with clear areas of responsibility. Clinical and administrative tasks are only part of the nurse’s role, while educational and coordinating activities are often equally important.

Conclusions: Despite the significant number of refugees in European countries we identified only few reports on MoC specifically addressing their needs. While parallel care structures may be an appropriate approach for a short period of time, integration of refugees into the regular health system is key. Specially trained nurses are well placed to support refugees through a range of measures, including health education and case management.

Key messages:

- Models of Care for refugees could help to navigate within a new healthcare system and ensure that no one is left behind. However, development of and research on such structures are still scarce.
- Specially trained nurses are well placed to care for refugees and to support their integration into regular health systems through a range of measures, including health education and case management.

Abstract citation ID: ckae144.259
Educational achievement and health during adolescence in second generation immigrants in Sweden

Sara Agnafors

S Agnafors[1,2], M Bladh[2,3], G Sydsjö[2,3], CG Svedin[4]
[1]Social Medicine, Regionhälsan, Region Västra Götaland, Gothenburg, Sweden

[3]Department of Obstetrics and Gynaecology, Linköping University Hospital, Linköping, Sweden
[4]Department of Social Sciences, Marie Cederschiöld University, Stockholm, Sweden
Contact: sara.agnafors@liu.se

Background: Over the last decades, immigration have increased markedly in Sweden. Educational achievement is essential for successful integration; however, second generation immigrants have been shown to lag behind. There is a complex intertwinement between educational attainment and health outcomes. Thus, schooling is crucial in terms of integration but also from a public health perspective. We aim to compare school performance and health in children of immigrant parents and children of parents born in Sweden.

Methods: In this population-based cohort study, 1723 children were followed from birth to age 20. Of these 246 (14.3%) had at least one parent born abroad. Logistic regression was performed controlling for gender, language spoken at home and sociodemographic data obtained at 3 months, 3-, 12- and 20 years. Outcome measures were school performance at age 12 ($n = 984$), grades from compulsory and upper secondary school ($n = 1668$) and register data on psychiatric diagnoses ($n = 737$). Self-response questionnaires on general health, long term health problems and psychiatric conditions were administered at age 20 ($n = 731$).

Results: There were no differences in reading ($p = 0.676$) or mathematics ($p = 0.324$) at age 12, eligibility to upper secondary school ($p = 0.298$) or university ($p = 0.232$) between second generation immigrants and children of native-born parents. No differences in frequency of psychiatric diagnoses ($p = 0.112$), presence of long-term health problems ($p = 0.267$) or self-reported health ($p = 0.595$) were shown.

Conclusions: The results indicate that young adults born in Sweden in the middle of the 1990's with immigrant parents perform similarly in school compared to children of parents born in Sweden. They are not at increased risk for mental illness, long-term health conditions and report their general health equivalently to children of native-born. The comprehensive school system and child health programs used in Sweden are likely important factors to promote education and health.

Key messages:

- In a birth-cohort of children followed into early adulthood, no difference in educational achievement or health was shown between second generation immigrants and children of parents born in Sweden.
- International comparative studies are needed to highlight the importance of underlying structural and socio-cultural factors.

Abstract citation ID: ckae144.260
Civic participation and self-reported health: An intersectional comparative study in Europe

Federica Rossetti

F Rossetti[1], *R Charafeddine*[1]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
Contact: federica.rossetti@sciensano.be

Background: Civic participation has been associated with better self-reported health (SRH). However, how does the association between civic participation and SRH vary by sex and migration status? This study aims to examine the association between social and political determinants of health and SRH in an intersectional perspective.

Methods: We use data from 26 countries in the 2022 EU Statistics on Income and Living Conditions (EU-SILC) ($n = 425,178$, 18-80 y.o.), following an intercategorical approach. Eight intersectional groups are created based on sex, migration status and being socially/politically active (participation in activities related to active citizenship or in formal/informal voluntary activities). Multilevel (ML) logistic regression models are employed to assess the association between these groups and SRH, controlling for age and educational level.

Results: 24.6% of the sample indicate to be socially or politically active, with significant differences between sexes and migration status. A higher proportion of non-migrant active men report good SRH compared to the other intersectional groups (95.2%). Preliminary results from the ML logistic models show that being active increases the likelihood of good SRH ($OR = 1.77$, 95% CI 1.72-1.83). Migrant active women report better SRH than their non-active counterparts ($OR = 1.27$, 95% CI 1.12-1.44).

Conclusions: Findings suggest that being socially/politically active has a positive impact on SRH, especially among foreign women living in European countries. The study highlights the importance of considering civic (both political and social) participation as health determinant and the need of investing in social capital as a way of health promotion, tackling health inequalities and the marginalisation of at-risk groups.

Key messages:

- Civic participation might strengthen individuals' health, including among migrant women.
- Public health policies should consider civic participation as significant determinant of individuals' health, as well as a way of tackling health inequalities.

Abstract citation ID: ckae144.261
Chronic pain over time among Syrian refugees resettled in Norway

Yeneabeba Tilahun Sima

Y Sima[1], *EM Strømme*[1], *E Diaz*[1,2]
[1]Global Public Health and Primary Care, University of Bergen, Bergen, Norway
[2]Health and Function, Western Norway University of Applied Sciences, Bergen, Norway
Contact: Yeneabeba.Sima@uib.no

Background: Chronic pain disproportionately impacts vulnerable groups such as migrants and refugees. This study investigates the long-term changes in chronic pain experienced by Syrian refugees in Norway and explores the factors influencing these changes.

Methods: This prospective cohort study used data from the CHART and Integration for Health studies, with data collection at three points: in Lebanon (Wave-1), one year (Wave-2), and four years post-arrival in Norway (Wave-3). All participants who completed surveys at these timepoints were included ($n = 132$). Chronic pain was measured by asking about pain lasting at least six months. Mixed-effects logistic regression was used to examine changes in prevalence and assess how age, gender, educational level (categorized as low, ≤ 9 years, and high, >9 years), and mental health symptoms (anxiety, depression, and post-traumatic disorders) affect these changes.

Results: Between Wave-1 and Wave-3, the proportion of participants reporting chronic pain increased from 31% to 53%, with an odds ratio of 3.6 (95% CI 2.2 - 5.8). There was an interaction between changes in chronic pain over time and participants' educational level, where the increase in pain prevalence over time was more pronounced among participants with lower educational levels than higher levels. No modification with the other factors were detected.

Conclusions: The study observed an increase in the number of participants reporting chronic pain over time. Low educational level at baseline emerged as a useful indicator for identifying those at higher risk of chronic pain. Understanding this correlation can be crucial for guiding preventive strategies and optimizing resource allocation to assist those most vulnerable.

Key messages:

- Chronic pain disproportionately impacts vulnerable groups such as refugees.
- Refugees with lower education levels at baseline were more likely to experience chronic pain over time.

Abstract citation ID: ckae144.262

Community Health Worker Service: addressing the needs of Gypsy/Travellers in Scotland

Camila Biazus Dalcin

C Biazus Dalcin[1], A McFadden[1], N Vidal[1]
[1]School of Health Sciences, University of Dundee, Dundee, UK
Contact: cdalcin001@dundee.ac.uk

Background: Members of the Gypsy/Traveller community in the United Kingdom face significant health inequalities compared to the general population, including lower life expectancy, higher rates of morbidity and suicide and poorer infant and child outcomes. This study evaluated the implementation of community-based lay workers in Scotland - the Gypsy/Traveller Community Health Worker (CHW) service.

Methods: This multi-method qualitative study (December 2021 to August 2023) included 16 individual interviews, five focus groups, one workshop, two informal discussions, and one site visit. Participants were stakeholders, CHWs, and members of the Gypsy/Traveller community. Additionally, 116 documents were analysed. The framework method, Proctor's implementation outcomes and thematic analysis were used for data analysis.

Results: CHWs reached approximately 1,000 individuals across six National Health Services (NHS) Boards. The implementation outcomes showed that the intervention was accepted and feasible. A third-sector organization (Black and Minority Ethnic Carers of People Project - MECOPP), played a crucial role in successfully delivering the CHW service. This innovative intervention employed members of the Gypsy/Traveller community as lay healthcare workers to break down barriers to accessing healthcare and other services (e.g., uptake of cervical screening, vaccination, housing, and sanitation). The CHWs were trusted, ensured healthcare information was culturally appropriate and successfully addressed discriminatory behaviours in health and social care. Limited resources pose challenges to the sustainability of the service.

Conclusions: The Gypsy/Traveller CHW service enhanced prevention, acted as a bridge between communities and health systems and addressed the wider determinants of health. The Gypsy/Traveller community still faces discriminatory, racist, and stigmatising behaviours, which further impede the quality, delivery, and accessibility of care.

Key messages:
- The Community Health Worker service was acceptable and feasible in the Gypsy/Traveller community, acting as a bridge between community and health systems and increasing access to services.
- Community Health Worker Service is an important strategy for delivering healthcare support through their sector organizations to address historical discrimination against minority ethnic groups.

Living conditions in Italian administrative detention centres for migrants: a scoping review

Elena Mazzalai

E Mazzalai[1], S Caminada[1], D Giannini[1], G Marchetti[2], A Angelozzi[3], A Gatta[1], C De Marchi[1], F Turatto[1], S Declich[2,4], M Marceca[1,4]

[4]Italian Society of Migration Medicina, S.I.M.M., Rome, Italy
Contact: elena.mazzalai@uniroma1.it

Since 2011, Italy has experienced a growing flow of migrants, despite the implementation of restrictive and detention-oriented procedures. Detention facilities for migrants must provide health protection and general assistance to the person. Considering the critical state of the centres reported by various sources, this study gives an overview of the conditions in Italian detention facilities for migrants from a public health perspective. A scoping search of the peer-reviewed and grey literature was performed to investigate the public health standards currently in force in Italian detention facilities for migrants and refugees (Hotspot and CPR-Pre-removal Detention Centres). Articles published from 2009 to 2021 in English and Italian were included and qualitatively described in five categories: provision of healthcare, living conditions, protection of vulnerable detainees, access to legal advice, and the Covid-19 pandemic. 11 peer-reviewed studies and 24 grey documents were included. Guidelines on screening procedures for infectious diseases or vaccines appeared to be hastily followed; chronic and mental diseases were not appropriately addressed. The facilities were described as run-down, with scarce and poor-quality meals, and lacking of educational activities. A lack of protection for vulnerable categories was reported, including unaccompanied minors. The Covid-19 pandemic further exacerbated pre-existing issues, highlighting systemic weaknesses in preparedness and response. Life conditions within the centres for migrants in Italy fall significantly short of acceptable standards. The main problems are the unavailability of cultural mediation services and the insufficient protection of mental health. The overall conditions appeared to be not dignifying and violations of the law are, if not frequent, present and well recognised. Urgent reforms are warranted to address these shortcomings and ensure the humane treatment and protection of migrants within these facilities.

Key messages:
- Italy is responding to the recent inflow of migrants with policies oriented to detention and repatriation. To this, it established defacto detention centres for migrants, namely Hotspot and CPRs.
- The public health standards of migrants' repatriation centres are poorly followed and life inside the centres appears misereble.

4.P. Round table: Advancing genomic diagnostics for rare genetic diseases: a focus on non-clinical domains of HTA

Abstract citation ID: ckae144.264

Organised by: EUPHA-HTA, -PHG, -ETH, -ECO, -HSR
Chair persons: Chiara de Waure (EUPHA-HTA), Giovanna Elisa Calabrò (Italy)
Contact: chiara.dewaure@unipg.it

Genetic rare diseases are a burning global public health issue requiring a thorough assessment of the related burden. Unfortunately, curative therapies are oftentimes unavailable for genetic rare diseases; nevertheless, a prompt diagnosis could allow clinicians to elaborate supportive care plans for patients and their caregivers, determine the best care setting, and potentially consider enrolling them in clinical trials, if suitable. Innovative, effective, and sustainable diagnostic techniques, such as Whole genome sequencing

(WGS), are needed to address this growing health concern. At global level, there is a paucity of research that specifically investigates the implementation of WGS into clinical practice which is even more constrained at the European level. Furthermore, given the current challenges impacting pediatric patients suspected of having genetic diseases without a definitive diagnosis, there is an urgent need to improve the diagnostic workflow based on genomic techniques, such as WGS. Delving into this topic could contribute valuable insights that can inform policymakers, at macro-level, and health professionals, at micro-level, on how to develop suited genomic policies and clinical guidelines for the proper adoption of WGS within the daily clinical practice. From an international standpoint, it could be argued that these considerations resonate with the United Nations Sustainable Development Goals (SDGs), particularly SDG 3 (i.e., “Good health and well-being”) and 10 (i.e., “Reduced inequalities”), as a priority for research and action. Notwithstanding, the broader implementation of WGS encounters hindrances owing to its complexity and the multifaceted social, economic, organizational, and ethical implications. In view of these challenges, Health Technology Assessment (HTA), as an integrated and multidisciplinary process, provides a comprehensive framework for the evaluation of these dimensions. This round table is intended to provide attendees with insights into nonclinical domains of HTA of WGS which, unlike clinical domains, demand a nuanced approach within the framework of the HTA. The intended objective is pursued through the initial presentation of a case study on the evaluation of WGS in paediatric genetic disorders from the Italian National Health Service perspectives followed by an open discussion with experts. The discussion will delve into issues related to economics, genomics, health services organization and ethics.

Key messages:

- For pediatric patients suspected of having a genetic disease, WGS could shorten the so-called diagnostic odyssey.
- Context-depending aspects of implementing WGS should be properly taken into account through HTA.

Abstract citation ID: ckae144.265

Integration of Whole genome sequencing in pediatric healthcare: an Italian HTA

Mario Cesare Nurchis

M Nurchis[1], A Heidar Alizadeh[1], GM Raspolini[1], G Damiani[1,2]

Contact: mariocesare.nurchis@unicatt.it

Diagnosing pediatric rare diseases poses challenges due to ambiguous symptoms and genetic complexities. Next-generation sequencing (NGS) technologies, like Whole exome sequencing (WES) and Whole genome sequencing (WGS), offer faster and more accurate diagnoses, enhancing clinical utility. However, WGS implementation faces hurdles including complexity and socio-economic impacts. This Health Technology Assessment (HTA) aims to evaluate the integration of WGS, compared to WES, into the Italian NHS for pediatric genetic disorder diagnosis, considering diverse stakeholders and value generation. The EUnetHTA Core Model 3.0 was the primary framework for evaluations. Various methodologies, such as narrative, scoping, and systematic reviews, meta-analysis, GRADE assessment were employed to assess existing evidence. Bayesian cost-effectiveness analyses were adopted for the economic aspects. Summative thematic analysis was used to evaluate organizational aspects of implementing WGS. In respect to non-clinical domains, organizational differences between WES and WGS implementation were seen in respect to procedural steps (i.e., genome rearrangement analysis, data storage) albeit both reduce the need for additional tests. WGS is cost-effective, with Bayesian analysis revealing incremental cost per additional diagnosis lower than the threshold. Ethically, WGS benefits outweigh risks, but comprehensive genetic counseling should address concerns like unsolicited findings and misattributed parentage. Timely genetic diagnosis through genomic technologies may shorten the diagnostic odyssey ensuring brighter futures for children and advancing health care equity. Nevertheless, the implementation of genomic knowledge in clinical practice brings organizational, economic, and ethical issues urging critical reflection in HTA evaluations and a multi-stakeholders involvement.

4.Q. Scientific session: Global landscapes of healthcare worker migration: advancing effective and equitable solutions

Abstract citation ID: ckae144.266

Organised by: EUPHA-HCW, WHO/Europe, Babeș-Bolyai University (Romania), WHO Collaborating Center for Health Workforce Policies and Planning
Chair persons: Ellen Kuhlmann (EUPHA-HCW), Marius-IonuțUngureanu (Romania)
Contact: e.kuhlmann@em.uni-frankfurt.de

Background: Healthcare workforce migration not only increased in numbers, the mobility flows and migration patterns are also changing and becoming more diverse. The labour market push-and-pull factors and related risks of ‘brain-drain’ are still relevant and many countries, especially in the western world, heavily rely on foreign-born and foreign-trained healthcare workers to mitigate shortages and respond to the healthcare workforce crisis. However, this migration pattern increasingly co-exists with other patterns, blurring the categories of hosting and sending countries. For instance, some low- and middle-income countries have created the export of skilled healthcare workers as business model, others invest in healthcare worker education without advancing national labour market capacities. There is also an increase in crisis migration caused by wars, climate change, and other conflicts, yet these refugee healthcare workers are often excluded from the formal labour market. These examples illustrate that health policy across countries largely failed to respond to the changing global landscapes of migration and to govern education, recruitment and retention more effectively. The healthcare workforce debate is primarily driven by health labour market needs, while health policy and human rights remain marginal. There is also a lack of comprehensive data and research, that would allow for evidence-based decision-making. Ineffective policy and existing governance gaps exacerbate the global healthcare workforce crisis, increase stress and workload of the healthcare workers, and often ignore worker and human rights.

Objectives: This workshop looks beyond labour market push-pull factors and highlights the complexity of healthcare worker migration. It makes the diverse needs, stakeholder interests, and institutional frameworks visible that shape mobility patterns of healthcare worker, seeking to identify capacity for more effective governance and good-practice examples. The following major questions will be discussed, among others: What data and research are needed to better understand the global migration landscapes? What can we learn from cross-country knowledge exchange and good practice experiences? How can public health advance more equitable and effective education, recruitment and retention policy, and what role could global contracts and international organisations play? The interactive discussion will be facilitated by a commentary on global capacity building for equitable healthcare worker migration and the action taken by WHO. The presenters and the audience will advance knowledge exchange and critically explore novel solutions to the healthcare workforce crisis that are more sensitive to the needs of both individual migrant healthcare workers and less well-resourced countries, in the global South as well as within Europe.

Key messages:

- Increasingly divers patterns of healthcare worker migration call for novel governance approaches that align labour markets, health policy needs, and human rights.
- More effective, equitable and 'humanised' governance of healthcare worker migration needs a global public health and human rights approach.

Abstract citation ID: ckae144.267
A source and a destination country for migrant healthcare workers: the case of Ireland

Niamh Humphries

H Hanlon[1], *N Humphries*[1]
[1]Graduate School of Healthcare Management, RCSI, Dublin, Ireland
Contact: nhumphries@rcsi.ie

Background: Ireland has a long tradition of emigration, particularly to countries such as the United Kingdom and the USA. Since 2000, Ireland has become increasingly reliant upon migrant healthcare workers. At present, 43% of nurses and 45% of physicians registered in Ireland, trained internationally.

Methods: This study draws on literature and available data (migration and registration data) to illustrate recent patterns of healthcare worker migration into and out of Ireland.

Results: The data show that Ireland depends heavily on migrant healthcare workers to staff its health system. In 2021-22, internationally trained healthcare workers comprised 71% of new entrants to the medical register and 69% of new entrants to the nursing register. In terms of outward migration, the data also indicate a consistent pattern of outward migration of physicians to countries such as Australia, the United Kingdom, Canada, and New Zealand.

Conclusions: A heavy (and growing) reliance on migrant healthcare workers to staff the Irish health system implies a failure to train or retain sufficient healthcare workers locally and indicates weak healthcare workforce planning capacity. It also highlights a disconnect between Irish healthcare workforce planning and the WHO global code on the international recruitment of health personnel. This study will consider some of the risks associated with high rates of inward and outward healthcare worker migration in the Irish context.

Background: To address domestic shortages, high-income countries are increasingly recruiting healthcare workers from low- and middle-income countries. This practice is much debated, yet empirical evidence is rare. This study fills this knowledge gap by reporting high-level stakeholders' perspectives on health system impacts of international migration and active recruitment of HCWs in Colombia, Indonesia, and Jordan.

Methods: We used a multiple case study methodology, based on qualitative methods integrated with information available in the published literature.

Results: All respondents decried a lack of robust and detailed data as a serious challenge in ascertaining their perspectives on impacts of healthcare workersmigration. Stakeholders described current emigration levels as not substantially aggravating existing healthcare workforce availability challenges. This is due to the fact that all three countries are faced with healthcare worker unemployment grounded in unwillingness to work in rural areas and/or overproduction of certain cadres. Respondents, however, pleaded against targeting very experienced and specialised individuals. While observing little harm of healthcare worker migration at present, stakeholders also noted few benefits such as brain gain, describing how various barriers to skill enhancement, return, and reintegration into the health system hamper in practice what may be possible in theory.

Conclusions: Improved availability of data on healthcare workers migration, including their potential return and reintegration into their country of origin's health system, is urgently necessary to understand and monitor costs and benefits in dynamic national and international health labour markets. Our results imply that potential benefits of migration do not come into being automatically, but need in-country supportive policy, such as favourable reintegration policies or programs targeting engagement of the diaspora.

[6]Department of Pharmacy, Makerere University School of Health Sciences, Kampala, Uganda
Contact: eleanor.hutchinson@lshtm.ac.uk

Background: In many countries in Africa, there is a paradoxical surplus of under and unemployed nurses, midwives, physicians and pharmacists which exists amidst a shortage of staff within the formal health system. By 2030, the World Health Organisation Africa Region may find itself with a shortage of 6.1 million healthcare workers (HCWs) alongside 700,000 un- or underemployed health staff. This study aims to bring the nature and consequences of an existing paradoxical surplus of HCWs in low income countries into the HCW migration debate and to explore novel solutions.

Methods: The study draws on a rapid review of the literature and deeper insights from expert information, using examples from Uganda, Kenya and Niger.

Results: In Niger, between 2010-2014, 55% of health graduates were unable to find permanent work in the sector leaving 15 000 HCWs unemployed or in precarious jobs. In Sudan, an 8-fold increase of the number of places at medical colleges (between 1996-2012) was not accompanied by a commensurate investment in physician positions leading to increased unemployment and brain drain. In Kenya, in 2021, 27243 HCWs were un or under-employed. In Uganda, 20590 nurses and midwives were reported as unemployed in 2023. Despite this, the emphasis in policy debates about the healthcare workforce crisis in most national and global levels is on staff shortage and the need to train more HCWs. In contrast, an existing surplus HCWs and their association with patterns of migration are largely unknown. Little time is given over to understand the economic, political and social factors that have driven their emergence and the governance challenges and potential interventions to improve employment rates.

Conclusions: The results highlight the complexity of migration, labour market conditions and health systems, in particular in low income countries in Africa. Both qualitative and quantitative data is necessary for policy makers to find effective solutions to the problem.

Abstract citation ID: ckae144.270
Forced displacement and the healthcare workforce crisis: Venezuelan healthcare workers in Peru

Gareth Rees

G Rees[1]
[1]Universidad ESAN, Lima, Peru
Contact: garethrees100@gmail.com

Background: The migration of healthcare workforces tends to be economically based benefiting high income countries, while draining lower-income countries of workers and skills. However, national instability or civil conflict may also have the effect of forcing out health workers. Few articles focus on the experiences of these types of migrants. This study aims to close a gap in the migration debate by exploring the capacity of integrating displaced healthcare workers in middle-to-low resourced health systems, using Peru as a case study.

Methods: The study draws on a policy analysis, statistical data and expert information from Peru.

Results: Peru has become the second largest Latin American destination for Venezuelan forced displaced migrants, a number of which are healthcare workers. While the exact numbers of these workers is unknown, it is estimated that 4,000 and 3,000 physicians and about 2,500 nurses and health technicians from Venezuela reside in Peru. These workers find entry into the heath system difficult due to bureaucratic and costly registration and qualification validation procedures. However, during Covid-19 the conditions were relaxed, and a large number of these workers entered the healthcare workforce. They were primarily physicians and worked in urban medical facilities, though there was some distribution across the country's departments. This avenue to the healthcare workforce allowed the mobilisation of dormant health skills and assisted to lift density numbers.

Conclusions: Peru's experiences bring into focus the potential benefits of mobilising new resources through integrating displaced healthcare worker migrants. It is too early to assess the sustainability of these policies on the country's healthcare workforce and its Universal Health Coverage goals, yet there seem to be some positive experiences.

5.A. Scientific session: From theory to action - Applying the Medical Research Council framework on complex interventions

Abstract citation ID: ckae144.271

Organised by: Aarhus University (Denmark), Cardiff University (UK)
Chair persons: Rhiannon Evans (Denmark), Helle Terkildsen Maindal (Denmark)
Contact: naje@ph.au.dk

The reasons for the workshop: Globally, public health problems such as obesity, poor mental health, and social inequality in health are on the rise. Tackling these significant challenges requires well-designed complex interventions. Interventions rarely follow linear sequences from intervention design toward large-scale implementation. Rather, they take non-linear trajectories by constantly adapting the intervention design according to the context. This thinking is outlined in the British Medical Research Council's (MRC) 2021 framework for developing and evaluating complex interventions. This workshop encompasses four case projects, each corresponding to one of the four phases in the framework: i) development, ii) feasibility, iii) implementation, and iv) evaluation. However, recognising the deliberately generic nature of this framework, our workshop also encompasses co-creation, process evaluation, and implementation theories and methodology. Combining these methodologies presents challenges that necessitate clear argumentation and critical reflection. In this workshop, we will share the challenges encountered when applying the MRC 2021 framework and hopefully inspire future innovative opportunities in intervention research. Specifically, this workshop aims to:

i) exchange challenges from intervention research methods and theories drawing on presenters' experiences across four public health case projects. Presenters will critically reflect on the key concepts from the MRC framework including context, programme theory, engagement of stakeholders, uncertainties, and refinement of interventions.

ii) discuss opportunities for future complex intervention research and outline best practices for using the MRC 2021 framework for complex interventions.

The added value of organising the workshop: The audience attending this workshop will reflect on multiple on-the-ground experiences of applying methodology and principles from the MRC 2021 framework as well as methods and theories relevant to intervention research: co-creation, qualitative (e.g., ethnography, interviews) and quantitative (e.g. experimental, observational) methods applied to all core phases of complex interventions. At the end of the workshop, the audience will be invited to participate in an open, plenary discussion facilitated by the workshop's chairs: two international experts on complex interventions, Reader Rhiannon Evans and Prof. Helle Terkildsen Maindal. The experts will encourage the presenters and audience to reflect critically on the case projects and ways forward for complex intervention research. Coherence between the presentations in relation to the workshop topic: The four case projects are guided by the MRC 2021 framework for complex interventions and involve public health interventions at the individual, interpersonal, and structural levels in Denmark and Canada.

Key messages:

- Tackling public health challenges demands innovative and well-designed complex interventions combining research traditions, principles from health promotion, and cutting-edge best-practice frameworks.
- The symposium will create a platform for cross-disciplinary knowledge exchange through case projects and expert-led joint discussions on how to apply the MRC 2021 framework for complex interventions.

Abstract citation ID: ckae144.272
Mothers to Babies & Art of Creation: Canadian stakeholder engagement during intervention development

Luseadra McKerracher

L McKerracher[1], *J Chin*[2], *D Sloboda*[3,4,5]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]School of Graduate Studies, McMaster University, Hamilton, Canada

[4]Departments of Pediatrics, McMaster University, Hamilton, Canada
[5]Farncombe Family Digestive Health Research, McMaster University, Hamilton, Canada
Contact: luseadramckerracher@ph.au.dk

Background: The 2021 British Medical Research Council framework, outline that effective development of interventions requires engagement of diverse stakeholders. In practice, however, engaging stakeholders in health intervention development often receives insufficient investment. The Mothers to Babies (M2B) Study and its linked Art of Creation (AoC) Intervention Project comprise a joint case study in prioritizing stakeholder engagement.

Methods: From 2016 to 2019, our M2B team dedicated its financial and personnel resources to assessing community health priorities for preventing non-communicable diseases (NCDs) in Hamilton, Canada. Motivated by a "first 1000 days" approach (i.e. health environments through pregnancy and infancy have outsized impacts on NCD risks across a child's life), we worked with stakeholders to identify acceptable, feasible complex intervention strategies supportive of health behaviours among pregnant Hamiltonians. To this end, we surveyed 434 pregnant people of diverse backgrounds and ran focus groups, interviews, and meetings with 69 stakeholders with diverse orientations to pregnancy and family health provision.

Results: M2B's work indicated two areas actionable through a complex, behavioural intervention: 1) lack of knowledge about the first 1000 days, and 2) need for platforms for peer support and empowerment. These themes were centred in the development and the stakeholder-engaged implementation/evaluation of the ongoing AoC intervention study. AoC uses outreach through local cultural institutions and arts-based workshops to facilitate understanding of the first 1000 days. AoC increases participants' knowledge of the first 1000 days, supports social relationships among participants and is enjoyable and empowering.

Conclusions: Investing three years and dedicated personnel to stakeholder engagement by M2B yielded the development of AoC, a complex health promotion intervention that fits the diverse priorities of Hamilton communities.

[3]School of Agriculture & Food Science, University College Dublin, Dublin, Ireland
Contact: naje@ph.au.dk

Introduction: According to the 2021 British Medical Research Council 2021 framework, a feasibility study aims to assess intervention-specific progression criteria. Fidelity is a critical criterion because it concerns how an intervention is implemented as intended. Fidelity conceptualisation has expanded beyond intervention adherence to encompass participant engagement, i.e., how well they receive and enact the intervention, but these latter aspects achieve little attention. We aimed to assess the fidelity of the Face-it intervention, a health promotion intervention for women with a history of gestational diabetes mellitus and their families. The intervention consisted of three home visits and health technology delivered by health visitors/coaches. Our fidelity assessment included: i) training of the health visitors/coaches ii) the delivery, iii) receipt, and iv) enactment of the intervention.

Methods: The National Institutes for Behaviour Change Consortium's (NIHBCC) framework for fidelity was used to assess four elements of fidelity. Data were collected from 150 women using intervention checklists, health technology logs and the virtual climate care questionnaire, which measured autonomy supportiveness from the intervention.

Results: The health visitors/coaches received four training days before the implementation and 16 hours throughout the intervention delivery. 73.3% of women completed three home visits, and 91.3% of women registered as health technology users. The participants perceived the intervention to be autonomy supportive, encourage health behaviour change and provide effective possibilities for health behaviour change, even though the delivery of the health technology varied greatly.

Conclusions: The Face-it intervention was largely implemented as intended. Using the NIHBCC framework, we expanded our fidelity conceptualisation and gained important insight into the feasibility of the intervention and interplay between delivery, receipt, and enactment.

Abstract citation ID: ckae144.274
The role of the organisational context in the implementation of a complex mental health intervention

Amanda Nikolajew Rasmussen

AN Rasmussen[1], *HT Maindal*[1,2], *V Burau*[1]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]Health Promotion Research, Copenhagen University Hospital - Steno Diabetes Center, Herlev, Denmark
Contact: anr@ph.au.dk

Introduction: The 2021 framework for complex interventions introduced by the UK Medical Research Council highlights context as one of the core elements. In the implementation phase, context is considered especially critical as it affects the intervention's effect, sustainability, and transferability. However, in public health implementation research, there is a lack of understanding of the interrelatedness between intervention and context conditions. This study aimed to explore the role of the organisational context in implementing a complex mental health intervention.

Methods: The study was designed as an ethnographic case study. This design enabled a comprehensive exploration of the relation between the case and its context by providing insights into the process of change implied in the implementation and how this collides with the organisational norms, culture, and structure. Four general practices participating in The Healthy Mind Intervention were included as cases. One-person interviews with clinic owners, focus group interviews with personnel, and observations of intervention activities and everyday life in the practices were used to collect data.

Results: Three themes were identified. First, existing organisational norms, ideals, and values were replicated in the implementation process and either inhibited or facilitated the process of change. Second, different narratives of both implementation and context existed among some of the professional groups, which complicated the collaborative efforts in the implementation. Last, conflicts in the organisations were actualised in the implementation process, which enabled a discussion and improvement of these issues.

Conclusions: Ethnographic case studies provide extensive insights into the role of the organizational context in implementing complex interventions, which is critical for the implementation to be effective, qualified, and sustainable.

Contact: jsaj@via.dk

Introduction: The 2021 framework from the UK's Medical Research Council defines evaluation as a theory-driven approach to examine how well an intervention works. However, the application of these guidelines can be challenging. Therefore, using a process evaluation case study on an exercise and patient education intervention for adults with acetabular dysplasia, we reflect on which specific aspects were relevant for the evaluation of the intervention and why. We focus on detailing methods to assess implementation (process, dose, reach), acceptability, mechanisms of change, and the impact of contextual factors.

Methods: Two hundred trial participants aged 18-50 years will be recruited from a University Hospital in Denmark and randomised to intervention and control groups. The process evaluation adopts a concurrent mixed-methods design involving self-report questionnaires at baseline and 6-month follow-up, training records and semi-structured focus groups with intervention providers ($n = 10$) and healthcare managers ($n = 4\text{-}6$). The mechanisms of change will be explored through semi-structured one-to-one interviews (at baseline and 6-month follow-up) with 15-20 purposefully sampled trial participants, and additionally, through exploratory examinations of associations between dose and change in health outcomes at 6-month follow-up), via simple linear regression models. The acceptability and contextual factors will be explored through one-to-one participant interviews, plus focus groups with 4-6 healthcare managers. Thematic analyses of the interviews will focus on expectations, experiences, events, personal understandings and interpersonal and organisational interactions.

Conclusions: The presentation will explore how the operational aspects of the intervention can be assessed through a process evaluation and how these findings may improve and expand any future implementation efforts.

5.B. Round table: Improving digital health literacy in the era of generative artificial intelligence

Abstract citation ID: ckae144.276

Organised by: EUPHA-HL, -HP, -DH, -ETH, -FS, -GH, IUHPE Working Group on Health Literacy, Technical University of Munich (Germany)
Chair persons: Don Nutbeam (Australia), Orkan Okan (EUPHA-HL)
Contact: orkan.okan@tum.de

Improved access to generative Artificial Intelligence (AI) platforms and technologies has prompted greater awareness of their potential application in health communication. This workshop will examine this potential alongside the practical challenges and risks of using generative AI in health communication in the broader context of the European Union AI Act. The workshop will explore the implications for the concept of digital health literacy in ways that reduce or mitigate existing digital health inequities across and within Europe. Chatbots and conversational AI platforms such as ChatGPT have opened opportunities for people to find, understand and use health information in significantly different ways. Public health professionals are already using these technologies to simplify health and medical information and to make it available in different languages. AI assisted technologies are also being used to create interactive and engaging learning experiences that provide the public with real-time feedback and insights about their health as well as prompting and reinforcing actions they can take to improve health. These developments have fundamental implications for our understanding of digital health literacy and the methods we use to support people in optimising the potential benefits of AI. Different communities in Europe vary considerably in their

- access to digital technology,
- skills to discriminate the accuracy and reliability of information, and
- trust and responsiveness to what digital technologies have to offer.

Building these fundamental digital health literacy skills is a critical priority if we are to ensure that all people benefit equitably from the potential offered by AI. Those of us engaged in improving health literacy have an important role to play in influencing the future direction of AI in health communication, including and especially by engaging in research and development activities that build evidence of effectiveness and support the development of digital health literacy skills in parallel with the expansion of access to AI-assisted digital technologies. The workshop chairs will provide introductory and summary remarks, moderate the panel discussion, and facilitate audience participation in the workshop. The individual panel members will make 3-minute introductions to key issues from different perspectives on the emerging practical applications of generative AI in health communication as well as the implications for strategies to improve digital health literacy in different population groups. The panel is made up of individuals in different roles and at different career stages who can offer complementary perspectives on these issues. Following the presentations, the co-chair will present some follow-up questions to the Panel before engaging directly with the workshop attendees for an open but structured discussion scheduled to last for 30 minutes of the Workshop.

Key messages:

- We will examine how generative artificial intelligence has opened new both new opportunities and risks in the ways people find, understand and use health information.
- We will consider how we can optimise the benefits of generative AI in a way that is equitable through the development of digital health literacy within and between communities in Europe.

5.C. Scientific session: Strengthen resilience against emerging vector-borne diseases through the ECDC Fellowship Programmes

Abstract citation ID: ckae144.277

Organised by: European Centre for Disease Prevention and Control (Sweden)
Chair persons: Sara Mazzilli (France), Sebastian von Schreeb (Denmark)
Contact: sara.mazzill@gmail.com

Over the past decade, climate change has impacted the transmission of a wide range of vector-borne diseases (VBDs) in Europe, where locally transmitted outbreaks have occurred. It has been implicated in the observed expansion of competent disease vectors in Europe such as Aedes albopictus, which transmits diseases such as Zika, Dengue and Chikungunya. Climate may influence the life cycle of vectors, and the reproduction rate of viral particles inside vectors and human hosts, which means that upsurges in temperature can reduce the incubation period of these pathogens and the life cycle of vectors, thus boosting transmission risk through elevated vector populations. Moreover, globalization and international air travel contribute to pathogen and vector dispersion internationally. Risk mapping suggests further expansion of the species in northern Europe due to climate change. The above underscores the necessity for more proactive measures, such as developing an effective vector control program by monitoring the density and distribution of hosts and pathogens at urban, national, and cross-border levels. Additionally, establishing early warning systems based on integrated human and zoonotic and entomological surveillance is crucial to detect alerts promptly and comprehend where and when infections may emerge or spread. Furthermore, cross-border collaboration and harmonization of vector-borne surveillance systems across European countries may improve preparedness, control and response to mosquito-borne diseases. Preparedness and response require significant efforts from EU Member States and neighbouring countries. Only through a multidisciplinary approach, involving multiple sectors, can we truly prepare to address public health threats. To contribute to strengthening resilience against cross-border public health and emerging health threats in EU Member States and neighbouring countries, the European Centre of Disease Prevention and Control (ECDC) has established three fellowship training programmes. These programmes aim to create and maintain a network of highly qualified epidemiologists, microbiologists and public health professionals and strengthen the public health epidemiology workforce at EU and neighbor countries. This workshop will offer attendees a comprehensive overview of the ECDC's fellowship programmes, describe how they function and explain their role in preparing for health threats. It will provide examples of three projects carried out by fellows on the implementation of preparedness, response and control measures for emerging vector-borne diseases in European countries at local, national and multinational levels. Those will set the scene for an in-depth analysis of the key challenges faced and can help promote awareness that integrated, multidisciplinary interventions are both feasible and effective in reducing the threat of vector-borne infectious diseases spreading in Europe and neighboring countries.

Key messages:

- ECDC fellowship programmes aim to strengthen resilience against emerging public health threats in EU Member States and neighboring countries.
- Fellows are engaged in national and cross-border integrated and multidisciplinary interventions to strengthen preparedness and mitigate the spread of emerging vector-borne diseases.

Abstract citation ID: ckae144.278
Building Resilience: Strengthening European public health workforce through ECDC Fellowship Programs

Pawel Stefanoff

K Danis[1], *P Stefanoff*[1]
[1]Public Health Training, ECDC, Stockholm, Sweden
Contact: pawel.stefanoff@ecdc.europa.eu

The European Centre for Disease Prevention and Control (ECDC) Fellowship programmes offer a two-year training in field epidemiology (EPIET) and in public health microbiology (EUPHEM) aiming to create and maintain a network of highly trained field epidemiologists and public health microbiologists and strengthen the public health epidemiology workforce in the European Union (EU) and beyond. The Mediterranean and Black Sea Programme for Intervention Epidemiology Training (MediPIET) also aims to strengthen the public health workforce in countries neighboring the EU. During the training, fellows who are based in different public health institutes in the EU and neighboring countries, set-up, implement and evaluate surveillance of communicable diseases, investigate outbreaks and conduct operational research directly linked to public health actions. The programmes facilitate knowledge exchange and collaboration across borders, building a foundation for participants and their institutions and promoting long-term collaboration through the alumni network. Participants from diverse disciplinary and cultural backgrounds enable interdisciplinary and multi-sectoral knowledge transfer, enhancing the effectiveness of public health responses. By facilitating collaboration and networking, exchanging experiences, disseminating best practices and assimilating lessons learned, these programmes contribute to addressing contemporary health challenges, including emerging vector-borne diseases and strengthening public health systems in Europe and neighboring regions. In the face of global challenges such as climate change and globalization, the fellowships exemplify how collaboration can strengthen Europe's defenses against emerging health threats.

Issue: The invasive Aedes albopictus mosquitoes are spreading in southern Europe and pose a heightened risk of mosquito-borne diseases, like Dengue and Chikungunya. On September 2023, A. albopictus was first identified in Lisbon through community-based surveillance and a multidisciplinary national Task Force (TF) was convened.

Description of the problem: The TF included experts in epidemiology, entomology, environmental health, laboratory diagnosis, prevention and control and communication. The objectives were to i) confirm A.albopictus presence in Lisbon and adjust the risk assessment, ii) raise awareness and prevent mosquitoes' spread, iii) revise national guidelines on arboviruses surveillance and control. During September-December 2023, the National Network for Vectors Surveillance (REVIVE) and the Hygiene and Tropical Medicine Institute sampled mosquito-prone habitats within 2km-radius of the detection point using QGIS software. They used snowball sampling to identify any new foci. They placed ovitraps for ongoing surveillance and conducted morphological analysis and xenomonitoring for pathogen DNA and RNA detection at the national reference laboratory.

Results: By November 2023, A.albopictus was detected in two new foci. No mosquitoes tested positive for arboviruses, and no autochthonous cases of mosquito-borne diseases were identified. The TF developed national guidelines for vector prevention and control and awareness for arboviruses and trained municipality workers. To raise awareness, we communicated with experts and the public through existing channels and media. As of April 2024, no new foci have been detected.

Lessons: Community-based surveillance and REVIVE approach were crucial for invasive A.albopictus detection and monitoring in Lisbon. Rapid multidisciplinary TF coordination may have been key for timely vector control.

Issue/problem: To date, Serbia has not detected locally acquired Dengue cases. Since a competent Dengue virus vector Aedes albopictus (Ae. albopictus) has been detected since 2017, imported cases have the potential to trigger local transmission.

Description of the problem: To ensure preparedness and timely response in the event of an epidemic signal in Serbia, we described the imported Dengue cases and analysed the geographical distribution and density of the vector. Probable and confirmed imported cases meeting the 2018 EU case definition were reported via the National Notifiable System between January 2019 and December 2023. We monitored the density and geographical spread of mosquitos, including Ae. albopictus, which were collected during May-October 2022 and 2023. Mosquito genera were determined according to morphological criteria and DNA barcoding.

Results: During the investigation period, physicians reported three probable and four confirmed imported Dengue cases; the mean age was 28.4 (standard deviation (SD)=11.5) years and 57% were male. Cases had travelled in Southeast Asia ($n = 6$) and the Caribbean ($n = 1$). The mean time interval from symptom onset to seeking medical care was 3.6 ($SD = 2.1$) days and from symptom onset to laboratory confirmation 7.4 ($SD = 6.3$) days. We collected 1994 Ae. albopictus mosquitoes in 308 sampling sites across 12 Serbian regions. We observed the highest number of mosquitoes in September (38%, $p < 0.001$) and in the Belgrade region (81%, $p < 0.001$). In 2022, we detected Ae. albopictus mosquitos in seven regions and in 2023 in nine.

Lessons: Ae. albopictus mosquitoes were widely distributed in Serbia, with the highest presence during September and in the capital region. The importation of Dengue cases from affected countries underscores the need for enhanced integrated and "real-time" surveillance linked with vector control activities.

Introduction: Colonization by the Aedes albopictus vector, alongside rising autochthonous dengue cases in France and Italy and imported dengue cases in Portugal reflect the emergent risk of Aedes-borne diseases in Southern Europe. In view of improving surveillance, preparedness, and response against Aedes-borne diseases in Europe, we aimed to systematically describe and compare the respective surveillance systems and response measures in place across France, Italy, and Portugal.

Methods: We employed a benchmarking analysis using a comprehensive set of surveillance system descriptors based on the ECDC document "Data quality monitoring and surveillance system evaluation". We collected data from key-informant interviews, national guidelines and literature, and ensured data collection harmonization through a consensus decision-making process.

Results: Each country has an integrated surveillance system for Aedes-borne diseases. The 3 countries share similarities in surveillance type (passive, compulsory, comprehensive, year-round operating systems), geographic coverage (national), case definitions (adapted EU case definitions), and notification processes. France also practices active surveillance and Italy and Portugal event-based surveillance to complement routine surveillance. Common response measures include visiting affected areas, active case-finding, and blood safety measures. France and Italy responses largely focus on vector control, while Italy and Portugal monitor pathogens in vectors.

Conclusions: Surveillance systems in France, Italy, and Portugal are similar, while their response measures vary, likely reflecting different epidemiological and entomological context. Implementation of harmonised, risk-based surveillance systems across southern Europe and enhanced cross-border collaboration may improve preparedness, control and response to Aedes-borne diseases.

5.D. Scientific session: Climate Change and Inequalities: Addressing Intersections and Impacts

Abstract citation ID: ckae144.282

Organised by: EUPHA-ENV, -LAW
Chair persons: Marija Jevtic (EUPHA-ENV), Brigit Toebes (Netherlands)
Contact: vlatka.m@gmail.com

Climate change poses one of the greatest challenges of our time, with far-reaching implications for environmental sustainability, social equity, and economic development. In recent years, growing attention has been paid to the intersecting dynamics between climate change and inequalities, recognizing that vulnerable populations are disproportionately affected by climate-related risks and impacts. This workshop aims to explore the multifaceted relationship between climate change and inequalities and examine the root causes of disparities. In this workshop we will explore intersectionality by examining how climate change intersects with various forms of inequality, including socio-economic and health status, gender, age, indigenous status, and geography, shaping differential vulnerabilities and experiences of climate impacts. This workshop aims to facilitate dialogue, knowledge exchange, and collaboration among public health researchers and professionals. We offer a unique opportunity to deepen our understanding of the complex interplay between climate change and inequalities, shedding light on overlooked aspects [?]. By bringing together diverse perspectives and expertise, the workshop aims to generate actionable insights and solutions that promote social justice, sustainability, and human rights in the face of climate change. The presentations in this workshop are thematically interconnected, addressing key aspects of climate change and inequalities from multiple angles. Topics include: Gender and climate justice, Climate change adaptation equity, Legal perspectives on climate change and inequalities and Climate Change Impacts on Respiratory Health. In conclusion, this workshop serves as a critical platform for advancing understanding, dialogue, and action on the intersection of climate change and inequalities.

Key messages:

- Climate change interacts with socio-economic, health, gender, age, indigenous status, and geography, influencing vulnerabilities and impacts.
- Vulnerable populations bear a disproportionate burden of climate change effects, including individuals with pre-existing lung conditions and children.

Sex differences in mortality associated with heatwaves: a systematic review and meta-analysis

Ana-Catarina Pinho-Gomes

A Pinho-Gomes[1,2], A Mcintosh[1], M Woodward[1]
[1]Institute for Global Health, UCL, London, UK
[2]The George Institute for Global Health, Imperial College London, London, UK
Contact: a.pinho-gomes@ucl.ac.uk

Introduction: The existence of sex and gender differences in the mortality associated with heatwaves remains unclear.

Methods: A systematic review and random-effects meta-analysis of population-based studies that investigated the mortality associated with heatwaves and reported results stratified by sex/gender was conducted (PROSPERO registration CRD42023430208). Bibliographic databases Medline and Embase were searched from inception to May 2024 with MESH terms for heatwaves/extreme heat and mortality. This was complemented with hand-searching of reference lists of relevant studies. The methodological quality of eligible studies was assessed using the Joanna Briggs Institute critical appraisal tool.

Results: In total, 931 studies were identified, of which 32 studies were included in the qualitative review and 11 in the meta-analysis. Most studies (20/32) reported a higher risk of heat-related death for women than men even after adjusting for or stratifying by age. Twelve studies showed statistically significant higher risks of death for women than men and 7 studies identified an increased risk of death for women, but the wide confidence intervals precluded making definite conclusions. Two studies reported a higher risk of death for men in comparison to women but only one was statistically significant. The remaining 10 studies found comparable risks for women and men. For the 11 studies included in the meta-analysis, women had an 8% increased risk of death in comparison to men (RR 1.08, 95% CI [1.02 to 1.14]). There was significant heterogeneity ($I2=69\%$, $p=0.001$) due to the variability in the definition of exposure, population, and setting. Most studies had a low to moderate risk of bias.

Conclusions: Women appeared to have an increased risk of death associated with heatwaves in comparison to men. Further research is warranted to understand the underlying factors and ensure the health protection response considers the gendered impact of heatwaves.

[2]Public Health Ethics Committee, Faculty of Public Health, London, UK
Contact: d.w.patterson@rug.nl

In many areas of public health policy, litigation has delivered significant, long-lasting impacts. Examples include tobacco control, increasing access to treatments for HIV, and addressing air pollution and climate change. Litigation is an established part of public health's advocacy toolbox in national courts, and increasingly in international courts and tribunals. In responding to climate change, in addition to potential policy and law reform, climate change litigation creates opportunities for public scrutiny and debate by raising awareness of inaction or harm caused by governments or private sector polluters, and sparking wider community mobilisation for climate action. Where climate change litigation is based on human rights claims, credible science-based evidence of the health and other human rights impacts of climate change is essential. Public health professionals are increasingly involved in assembling and presenting such evidence, often focusing on vulnerable populations. However, the multiple intersecting identities of vulnerable populations have not been sufficiently explored. For example, how does intersectional disadvantage influence the ways in which evidence of the impact of climate change is assembled and assessed? How are these issues addressed in the courts? Examples include older women (KlimaSeniorinnen v. Switzerland), young people, from both the global South and global North, in urban or remote areas, or with different pre-existing health conditions (Sacchi et al. v. Argentina et al), and Indigenous people, including women and children (Daniel Billy and others v. Australia; Teitiota and others v. New Zealand). Multiple identities can compound vulnerability. For example, young people may be more vulnerable both due to their physical immaturity and due to eco-anxiety and other mental health impacts. This presentation will explore these issues, and the critical role of public health professionals in legal action to address climate change.

[4]University of Southampton, Southampton, UK
Contact: Grace.Turner@lshtm.ac.uk

As climate change becomes more apparent, it is important to evaluate the equity implications of adaptation interventions and policy measures. Many coastal populations experience high levels of social deprivation, which can be compounded by environmental factors. Coastal hazards, such as erosion and flooding can cause short and long term impacts on physical and mental health. To systematically review the published evidence on the differential impacts of coastal change on health inequalities and review the implications of adaptation responses for health inequality. We systemically reviewed the evidence for the UK only on a) inequalities in coastal flood impact or risk, and b) effectiveness and equity implications of current measures to manage the climate risks to an acceptable level of impact. Interventions included: plans and guidance, insurance, and infrastructure, including natural flood management. We found 8 papers quantifying differentials in current and future impacts of coastal flood risk and 6 papers assessing equity implications of adaptation measures. Coastal flood risk is unevenly distributed. Those owning their own home were more likely to experience flood impacts including increased stress and displacement. There is good evidence that policies for household insurance and property level protection measures have the potential to increase inequalities; other measures (community engagement; planning; defences) may reduce health inequalities, depending on implementation and local context. Adaptation to coastal change requires a range of approaches in the short and longer term, which potentially exacerbate current inequalities. Adaptation responses that rely on individual behaviour change, such as relocation, purchasing insurance, or retrofitting dwellings, may exacerbate inequalities within coastal communities. Climate change challenges organisations to deliver national and local policy responses ensuring that adaptation is effective and equitable.

Abstract citation ID: ckae144.286
Climate Change Impacts on Respiratory Health: Bridging Inequalities in Children and Adults

Vlatka Matkovic

V Matkovic[1]
[1]Lungs Europe, Brussels, Belgium
Contact: vlatka.m@gmail.com

Respiratory diseases rank as the third leading global cause of mortality, with climate change exacerbating their prevalence and severity. Wild fires, floods, extreme heat events, infectious diseases, urban air pollution and aeroallergen exposure contribute to respiratory health deterioration. Vulnerable populations, including individuals with pre-existing lung conditions and children, bear a disproportionate burden of these effects. We centrepiece the connection of climate change to respiratory health inequalities, while bridging the evidence gap regarding increasing extreme heat and cold events, ambient and indoor air pollution exposure with significant ramifications on respiratory health. Specifically, we will showcase research on the tailored, multidisciplinary NCD prevention package named FRESHAIR4Life, targeting air pollution exposure in mid- to late adolescents from disadvantaged populations. Given the high burden of non-communicable diseases (NCDs) and air pollution exposure as major contributors, urgent preventive interventions are required, particularly in disadvantaged populations. Initiating preventive interventions during adolescence is considered an optimal window of opportunity for long-term health benefits. Furthermore, we will present a robust evidence base delineating climate change's impact on lung health among vulnerable European populations. We will discuss how narratives on climate-induced lung health issues are co-created with affected communities and stakeholders to facilitate policy translation. The aim of these presentations is to break silos among health professionals, fostering collaboration from the respiratory community to the public health community. Through lung health collaborations we seek to deepen understanding and catalyze action to address the intersection of climate change, respiratory health, and inequalities, ultimately working towards a healthier and more equitable health for all.

5.E. Round table: Crafting Policies for Health Promotion: evidence from local settings

Abstract citation ID: ckae144.287

Organised by: WHO Regions for Health Network

Chair persons: Ana M Carriazo (Spain), Bettina Maria Menne (Italy)

Contact: forcellinia@who.int

As communities vary in their needs, challenges, and resources, tailoring health promotion policies to specific contexts becomes imperative for effectiveness. Drawing upon the expertise of seasoned practitioners, policymakers, and researchers, this workshop offers a multifaceted perspective on navigating the complexities inherent in designing, implementing, and evaluating locally tailored health promotion policies, with a specific focus on environmental and social factors. The workshop will make it possible to compare different experiences from various European countries, with high-level speakers who have different backgrounds and roles in their countries and regions, thus providing an interesting and interactive way of comparing and examining real-world examples and best practices. The examples provided delve into: participatory techniques to design healthier environments, to identifying, collecting and elaborating evidence upon which to build policies and actions that are effective in addressing specific health challenges. Through the examples presented, we will seek to make the case for multi-actor and multi-sectoral collaboration. In addition, we will try to understand How do subnational authorities and partners identify priorities for action. A common question asked to the speakers will therefore: how can a variety of actors (local and regional authorities, university and research centres...) come together to support cross-sectoral action? How can policymakers be supported towards creating environments that prioritize the well-being of all, ensuring a healthier and more prosperous future for everyone? The end goal will be to enable attendees to be equipped with actionable strategies and tools to foster meaningful change within their own communities, by understanding the intricate interplay between community dynamics, stakeholder engagement, evidence-based practices, and policy implementation strategies. The workshop is being organized by the WHO Regions for Health Network (RHN).

Key messages:

- Tailoring health promotion policies to specific contexts is imperative for effectiveness, considering the diverse needs, challenges, and resources of different communities.
- Subnational authorities and partners must identify priorities for action and collaborate across sectors to address specific health challenges effectively.

5.F. Scientific session: Staying cool: innovative solutions for an ageing population in a warming Europe

Abstract citation ID: ckae144.288

Organised by: DG SANTE European Commission

Contact: forcellinia@who.int

The EU is facing the dual challenge of climate change and rapid population ageing: temperatures in Europe are warming more rapidly than in the rest of the world and at the same time the number of those aged 85 years or more in the EU is projected to more than double by 2050. The increase of morbidity and mortality due to extreme heat is higher in older adults compared to the other age groups. During the workshop, we will first address the effect of heat waves and raising temperatures on older adults' health and then present and discuss possible innovative tools and actions to minimise their impact on the EU ageing population.

Objectives: Emphasise the importance of addressing heat waves and raising temperatures including their impact on NCDs, with a focus on the implications for the ageing population; Present the reinforced activities of the Climate and Health Observatory, focusing on raising temperatures and heat waves; Discuss possible measures at EU level, multisectoral collaboration, the synergies and possible trade-offs between adaptation and mitigation measures; Discuss innovative solutions to minimise the impact of raising temperatures and heat waves on older adults.

Speakers/Panelists:

- Projections of heat exposure of older adults and the consequences.
- The European Climate & Health Observatory – presentation of reinforced & broadened activities.
- Measures for adapting to and protecting against the effects of heat waves and warming.
- Tackling the problem at the source: mitigating the contribution of the healthcare sector to GHG emissions/climate change.

5.G. Pitch presentations: Dietary patterns and behaviours

Abstract citation ID: ckae144.289

Mediterranean Diet, ultra-processed food consumption and semen quality in healthy young men

Licia Iacoviello

L Iacoviello[1,2]*, M Bonaccio*[1]*, E Ceretti*[3]*, F Donato*[3]*, S Lorenzetti*[4]*, M Marullo*[3]*, E Ruggiero*[1]*, GCV Viola*[3]*, D Zani*[3]*, L Montano*[5,6]
[1]Epidemiology and Prevention, IRCCS Neuromed, Pozzilli, Italy

[5]Oliveto Citra Hospital, Salerno, Italy
[6]University of Rome Tor Vergata, Rome, Italy
Contact: licia.iacoviello@moli-sani.org

Background: Diet quality can have beneficial effects on male reproductive health, although studies are still limited, and little is known on the potential impact of ultra-processed foods (UPFs) on semen quality parameters.

Methods: A cross-sectional analysis was run on 126 participants (mean age 20.0 ± 1.2 y) from the FAST randomized controlled trial in 2018-2019. Food intake was assessed through a FFQ. UPF was defined following the Nova classification and calculated as the ratio (weight ratio) between UPF (g/d) and total food (g/d). Adherence to the Mediterranean Diet (MD) was ascertained by the Mediterranean Diet Score (MDS). The semen analyses were performed using a microscope for optical evaluation with a Makler counting chamber and two automated semen analysers. The primary outcomes were sperm volume, concentration, motility and morphology. A hierarchical mixed model approach was utilized to accommodate the within-subject correlation arising from the triple temporal repetition of measurements.

Results: Highest UPF consumption (Q4), compared to lowest (Q1), was associated with lower sperm concentration (β=-54.1×106 spz./ml; 95%CI: -92.9 to -15.4; p-trend=0.002 across quarters), and progressive motility (β=-14.2%; 95%CI: -28.2 to -0.09; p-trend=0.036). The percentage of cells with normal morphology tended to be reduced in young men consuming more UPF compared to lowest intake (β=-2.93%; 95%CI: -6.22 to 0.37; p-trend=0.071). The MDS was not associated with any of the parameters under study.

Conclusions: A larger dietary share of UPF was inversely associated with sperm concentration and progressive motility in young men of reproductive age. MD adherence was not associated with semen quality parameters, and this is possibly due to the low variability of MD adherence in this sample. Dietary recommendations for improving sperm health should prioritize limiting UPF in the diet.

Key messages:

- Ultra-processed food (UPF) intake was unfavourably associated with semen quality parameters amongst young men.
- Dietary recommendations for improving sperm health should recommend limiting UPF.

Abstract citation ID: ckae144.290

Diet quality trajectories from infancy to age 18 and their association with diet quality at age 26

Saija Tarro

S Tarro[1]*, J Vahtera*[1]*, J Pentti*[1]*, K Pahkala*[1]*, H Lagström*[1]
[1]Centre for Population Health Research, University of Turku and Turku University Hospital, Turku, Finland
Contact: sapatar@utu.fi

Background and objectives: Dietary habits during childhood and adolescence show strong stability. However, no studies have investigated dietary trajectories from infancy to adulthood. We therefore aimed to 1) identify diet quality trajectories from age 1 to 18 years and 2) explore how trajectories are associated with diet quality at age 26 years.

Methods: The study included 620 individuals from the Special Turku Coronary Risk Factor Intervention Project (STRIP), started in infancy ($n = 1062$). Food and nutrient intake was assessed annually from age one to age 18, and again at age 26 using 4-day food records. A food-based diet score (range 0-33) was calculated to indicate diet quality. Group-based modelling was used to model trajectories of diet quality between the ages of 1 and 18 years. Linear regression analyses were used to investigate associations between the diet quality trajectory groups and diet quality at age 26 years.

Results: By the age of 18, we found five diet quality groups: 1) low (19% of participants) with a mean diet score of 12 points, 2) decreasing (25%) with a mean diet score of 15 points, 3) increasing (15%) with a mean diet score of 16 points, 4) intermediate (31%) with a mean diet score of 18 points, and 5) high (10%) with a mean diet score of 22 points. The diet quality trajectory groups were associated with 0.4 (decreasing), 2.5 (medium), 3.8 (increasing) and 4.1 (high) points higher diet scores at age 26 compared to the low diet quality trajectory group ($p < 0.001$ for all).

Discussion: Five distinct dietary trajectories were found from infancy to late adolescence, with a clear difference between the groups with the lowest and highest diet quality. However, the differences in diet quality levelled out by the age of 26 years. Our results suggest that diet quality established already in childhood moderately predicts diet quality into adulthood.

Key messages:

- Diet quality established in childhood moderately predicts diet quality in young adulthood.
- Five distinct dietary trajectories were found from infancy to late adolescence, with a clear difference between the groups with the lowest and highest diet quality.

Abstract citation ID: ckae144.291
Dietary Pattern Trajectories in French Adults Over Time (2014-2022): Role of Socioeconomic Factors

Hafsa Toujgani

H Toujgani[1], J Berlivet[1], F Berthy[1], B Allès[1], H Fouillet[2], M Touvier[1], D Lairon[3], F Mariotti[2], J Baudry[1], E Kesse-Guyot[1]

[3]Aix Marseille University, Marseille, France
Contact: h.toujgani@eren.smbh.univ-paris13.fr

While dietary transitions towards more plant-based diets are urgently needed, few studies have investigated current diet trajectories, based on observed longitudinal data. This study investigated current dietary transitions of French adults over an 8 years period (2014-2022), while assessing the nutritional quality of the consumed foods and the role of diverse socio-economic factors. Consumption data from 17,187 NutriNet-Santé cohort participants weighted for the French Census were collected using a food frequency questionnaire in 2014, 2018, 2022. Adopting a gender-specific approach, consumption changes in 23 food groups were assessed over time. The nutritional quality was evaluated using the cDQI score, categorizing foods into 'healthy' and 'unhealthy'. The socioeconomic analysis targeted four food groups (red meat, processed meat, legumes and wholegrain products), strongly linked to mortality risk and recognized as significant markers of the sustainable diet transition. All analyses were conducted using multi-adjusted mixed-effects models. Consumption of some healthy plant-based foods (nuts +59 %, legumes +22%, wholegrain products +7%) significantly increased over time; while consumption of some unhealthy foods (red meat -19%, refined cereals -18%, sweet drinks -15%) decreased. Conversely, consumption of prepared and mixed dishes (+16%), processed meat (+35%) and butter (+100%) increased. These changes differed in magnitude between sexes and translated into an improved food quality score (cDQI). Occupational status was linked to longitudinal changes in food consumption, showing increased intake of plant-based foods among students and higher socio-professional categories. Our findings provide accurate data on trends and factors for targeted initiatives, guiding strategic interventions for a sustainable dietary transition.

Key messages:

- Plant-based food consumption increased while unhealthy food intake, both plant and animal-based, decreased; Gender differences were observed in baseline consumption and the extent of changes over time.
- Occupational status was linked to longitudinal changes in food consumption. Increased intake of plant-based foods was observed among students and higher socio-professional categories.

Contact: maxim.dierckens@ugent.be

Background: Using a causal inference framework, our study aimed to extend previous work in providing a comprehensive understanding of the role various social contexts across different levels can play in predicting adolescent dietary behaviours.

Methods: Data came from the 2017/18 Health Behaviour in School-aged Children (HBSC) survey in Flanders (Belgium). The sample included representative data from 8,702 adolescents in 165 schools. Social factors at individual-level (family meals, family, peer, student and teacher support) and at contextual-level (school culture of student and teacher support and school-level socioeconomic status [SES]) were considered. Multilevel logistic regression analyses were performed.

Results: At individual-level, family meals and family and student support were positively associated with fruit and vegetable consumption, family meals with sweet consumption too. Student and teacher support showed positive associations solely with fruit consumption. At contextual-level, adolescents attending schools with a lower school-SES demonstrated lower vegetable consumption. Culture of teacher support was negatively associated with sweets but also vegetable consumption. For culture of student support no associations were found.

Conclusions: The study mainly provide cues for strengthening family social ties as dietary health promotion initiatives, with some evidence supporting the role of beneficial peer and school social factors. Mixed results for contextual school-level social factors warrant further research to identify additional school-related influences on adolescent dietary behaviours to advance current understandings.

Key messages:

- Family meals and support promote healthy eating in adolescents, emphasising the health promoting role of family social ties in dietary habits.
- Mixed findings on school-level social factors call for more research on school health policies.

[3]Department of Chemical and Pharmaceutical Sciences, University of Trieste, Trieste, Italy
Contact: giuliobarocco@gmail.com

Background: The WHO and FAO in the Second International Conference on Nutrition stress the role of nutrition standards for public facilities catering services (CS) and in the Sustainable Healthy Diet guiding principles (SHD) underline synergies among foods, nutrients present in dietary patterns and their bioavailability, degree of food processing, and subsequent health impact. In Italy almost one in 10 people eat a meal in CS every day. In accordance with SHD, the Italian Ministry of Health (MH) in the national guidelines for CS indicate activating procedures for the conservation of nutritional qualities (NQ) of micronutrients and bioactive substances. The central purchasing body of the Region of Friuli Venezia Giulia have applied these criteria, introducing the process of critical control points of nutrient analysis (NACCP) in the Public Procurement for the school catering of 69 municipalities and for all 18 regional hospital with more than 3 million meals per year served. The aim of the project was to develop rapid and cheap methods for monitoring the NQ of meals by applying the NACCP process.

Methods: 150 samples of pasta, milk and also vegetables, meat, fish with different degrees of processing, were taken from the CS and analysed both with chemical techniques and with optical rapid techniques (1300 analyses).

Results: The samples were subjected to conventional analyses to determine the oxidation state and the content of characterizing molecules such as polyphenols, histamine, and total compounds of Maillard. The same samples were then analyzed by color measurements. The results showed a good correlation between the two analytical systems, in particular the color measurements and the Maillard compounds and the color measurements and the oxidation state.

Conclusions: Project findings can be applied in the NACCP process to rapidly cost-effectively monitor the nutritional quality of CS meals, and adhere to WHO and FAO the SHD guiding principles and MH guidelines for CS.

Key messages:

- The development of rapid methods of monitoring the nutritional standards of public catering can implement sustainable food systems thereby promoting the healthy diets recommended by the FAO and WHO.
- Rapid methods of monitoring nutritional standards represent an innovative component in improving the culture of food and nutritional security in public catering.

Contact: b.sarda@eren.smbh.univ-paris13.fr

Introduction: Nutrient profiling systems are key tools in the development of nutrition-related policies. Their prospective associations with health outcomes are a crucial step in assessing their validity as public health measures. In 2023, the nutrient profiling system underlying the Nutri-Score -a nutrition front-of-pack label used in the European Union- was updated. The present study aims to investigate the updated nutrient profile's association with weight gain, overweight and obesity.

Methods: The dietary and anthropometric data of 75,775 participants of the Nutrinet-Santé cohort study was retrieved for this study. Standardized dietary indices derived from both nutrient profiling systems (the 2015 NS-NPM DI (initial profile) and 2023 NS-NPM DI (updated profile)) were computed based on at least 3 24-hour dietary records upon the first two years of inclusion in the cohort. The associations between these indices and the risk of developing overweight and obesity were assessed using Cox proportional hazard models and weight gain using mixed models.

Results: Participants with a higher 2023 NS-NPM DI (i.e. a poorer nutritional quality of diet) were more likely to gain BMI over time (T3 vs. T1: +0.23% points of BMI/year, $p < 0.0001$), had a higher risk of developing overweight (HR T3 vs. T1: 1.33 [95% CI: 1.24-1.43]) and obesity (HR T3 vs. T1: 1.29 [95% CI: 1.14-1.45]). Overall, the 2015 NS-NPM DI displayed similar associations and effect sizes with the outcomes and the predictive ability of the two indices on overweight and obesity risk was not significantly different ($p = 0.32$ for overweight risk, $p = 0.09$ for obesity risk).

Conclusions: These results constitute a step in the validation of the recently updated nutrient profiling system and help support its use in public policies for non-communicable diseases prevention.

Key messages:

- The 2023 updated nutrient profiling system underlying the Nutri-Score was associated with weight gain and obesity, two important risk factors in the development of non-communicable diseases.
- The 2015 and 2023 NS-NPM DI showed similar prospective associations with overweight and obesity risk.

Abstract citation ID: ckae144.295
Child-targeted foods in the Portuguese market 2024: Nutritional characteristics and claims

Roberto Brazão

R Brazão[1], P Fernandes[1], A Lopes[1], MG Dias[1]
[1]Food and Nutrition Department, National Institute of Health Dr. Ricardo Jorge, IP, Lisbon, Portugal
Contact: roberto.brazao@insa.min-saude.pt

Background: Excessive consumption of high-energy products with high saturated fats, sugars, and salt contents, contribute to the prevalence of overweight, obesity and other related diseases in Portugal, especially among children. Children represent a vulnerable group whose food choices are significantly influenced by advertisements and marketing methods that often promote highly palatable and less healthy foods. This study aimed to assess the nutritional characteristics of visually appealing products targeted at children in Portugal and analyse nutritional, health, and other mentions and claims, as well as icons present in the package. The goal is to contribute to the promotion of healthier food choices and inform public health policies.

Methods: Nutritional information and mentions/claims from child-targeted foods, featuring labels with cartoons and other appealing images, were collect. These were compared with the reference values (RV) of Integrated Strategy for the Promotion of Healthy Eating (EIPAS) and of Directorate-General of Health Label Decoder (RVLD), as well as the limit values (LV) defined by a Portuguese law related to restrictions on food advertising aimed at children.

Results: 247 products from six categories were monitored. Only 1.2% met the EIPAS RV for sugar and salt evaluated together, while 10.1% complied with the law LV. According to the RVLD, 19.0%, 26.3%, 49.4%, and 0.4% of the products presented high levels of fat, saturates, sugars, and salt, respectively. The majority of the products (68.0%) had one or more types of mentions/claims, predominantly nutritional (64.3%) and all featured one or more icons, with 10.5% being licensed.

Conclusions: The majority of these pre-packed child-target foods do not have a healthy nutrient profile. In this context, public health actions, namely legislative measures to further regulate food marketing and labeling elements aimed at children along with literacy and product reformulation initiatives are essential.

Key messages:

- The child-targeted food products in the Portuguese market present inadequate nutritional profiles.
- Public health actions are needed to promote healthier food choices and protect children from foodborne non-communicable diseases.

Abstract citation ID: ckae144.296
Predicting food consumption using contextual factors: An application of machine learning models

Nancy Tran

NR Tran[1], Y Zhang[1], RM Leech[1], SA McNaughton[2]
[1]Institute for Physical Activity and Nutrition, Deakin University, Burwood, Australia
[2]Health and Well-Being Centre for Research Innovation, University of Queensland, St Lucia, Australia
Contact: nrtran@deakin.edu.au

Background: Improving diet quality relies on making manageable adjustments to eating behaviours. Personalised nutrition interventions hold promise for modifying behaviour. Machine learning (ML) offers a novel approach to examining dietary behaviours in personalised nutrition by leveraging data on past behaviours and environmental contexts. This study aims to investigate whether contextual factors at eating occasions (EO) can predict food consumption to enhance diet quality.

Methods: Cross sectional data from the Measuring Eating in Everyday Life Study (MEALS) were analysed (n = 675, 18-35y). A smartphone food diary app recorded dietary intakes at EO for 3-4 non-consecutive days, also capturing social-environmental (e.g., activity) and physical-environmental factors (e.g., consumption location). Participant characteristics were collected via an online survey. Food groups intake (servings per EO) followed Australian Dietary Guidelines. This study benchmarked two established models, gradient boost decision tree and random forest, which have previously shown high performance in similar tasks. Performance was evaluated using 10-fold cross-validation, measuring mean absolute error (MEA), root mean square error (RMSE), and R squared. Feature importance analysis identified key variables for predicting food consumption.

Results: ML predicts most food groups at EO using contextual factors, with slight differences between actual and predicted consumption (<1 serving per EO). For fruits, dairy, and meat, MEA values were 0.35, 0.34, and 0.56 servings, respectively (RMSE values: 0.61, 0.50, and 0.80 servings). Self-efficacy, age and consumption location were influential in most ML models.

Conclusions: ML offers insights into contextual factors and food consumption, suggesting directions for precision nutrition interventions. Future research should identify positive influences of contextual factors on dietary behaviours and incorporate these insights into interventions.

Key messages:

- Machine learning can effectively predict food consumption based on contextual factors at eating occasions.
- Understanding the influence of contextual factors such as consumption location on food consumption can inform the development of precision nutrition interventions aimed at improving diet quality.

Abstract citation ID: ckae144.297

Associations between general practice and outpatient care continuity in people with multimorbidity

Thomas Beaney

T Beaney[1], J Clarke[1], T Woodcock[1], M Barahona[1], A Majeed[1], P Aylin[1]
[1]Imperial College London, London, UK
Contact: Thomas.beaney@imperial.ac.uk

Background: Relational continuity in primary and secondary care is linked to better health outcomes for patients, but it is unclear whether metrics of continuity in each setting are associated. Our study examined the association between relational continuity in general practice (GP) and continuity of hospital outpatient specialties in people with clusters of multimorbidity.

Methods: We used GP records from the Clinical Practice Research Datalink, linked to Hospital Episode Statistics outpatient records. Included were patients ≥18 years, with two or more of 212 Long-Term Conditions (LTCs), registered throughout 2019 and with at least three GP and three outpatient appointments. The Continuity of Care Index (COCI) was calculated separately for visits to the same i) GP and ii) hospital specialty, where 0 represents no continuity and 1 represents all visits to the same GP or specialty. We assessed the association between the indices using univariable and multivariable fractional logit regression. We calculated expected COCI scores for each LTC and assessed variation in the COCI between LTCs assigned to one of 15 clusters of co-occurring diseases derived previously. A sensitivity analysis repeated analysis using the Sequential Continuity (SECON) score, which captures longitudinal continuity.

Results: Of 1,135,903 patients, 56.2% were ≥60 years. The median (IQR) COCI in GP was 0.22 (0.11-0.40) and in outpatients was 0.33 (0.20-0.52). Although statistically significant ($p < 0.001$) the relationship between the two measures was clinically insignificant in both univariable and multivariable models. No strong relationships were found between COCI scores and LTC clusters. Similar patterns were found using the SECON score.

Conclusions: We found no strong association between continuity of care in GP and outpatient settings, and no clear patterns with LTC clusters. This suggests that lack of continuity in secondary care is not compensated for by increased continuity of care in primary care.

Key messages:

- We found no meaningful association between measures of continuity of care in general practice and hospital outpatient settings.
- Our findings suggest that lack of continuity of outpatient care is not compensated for by increased continuity in primary care.

Abstract citation ID: ckae144.298

The state of primary health care systems in ten high-income countries

Evan Gumas

E Gumas[1], C Lewis[1], C Horstman[1], M Gunja[1]
[1]The Commonwealth Fund, New York City, USA
Contact: eg@cmwf.org

Primary care systems in high-income countries perform comparatively better than the U.S. system in large part due to decades of investment, an adequate workforce supply, and universal healthcare. This research identifies successes and areas of improvement of 10 high-performing primary care systems in four areas of care: 1) access, 2) continuity, 3) comprehensiveness, 4) and coordination. Cross-national comparisons using primary data from the 2022 CMWF International Health Policy Survey of Primary Care Physicians (N ranged from 321-2,092) and the 2023 CMWF International Health Policy Survey on the General Population (N ranged from 750-4,820). Countries included: Australia, Canada, France, Germany, Netherlands, New Zealand, Sweden, Switzerland, the U.K., and the U.S.

- More than 90% of adults in all surveyed countries reported having a regular primary care doctor except Sweden, the U.S., and Canada.
- Less than 5% of physicians reported high telehealth use in their patient encounters, except for in the U.K. and New Zealand where over 10% reported high use.
- Over a quarter of physicians in the U.S., Germany, and France report screening patients for social needs, compared to just 8% in the Netherlands.
- Care coordination with social services was a major challenge in all surveyed countries, with over 75% of physicians in the U.K., Australia, and France reporting major challenges.

Primary care systems in 10 other high-income countries outperform the U.S. system, particularly when it comes to access to care and care continuity. Policy options to consider for U.S. policymakers include narrowing the wage gap between generalist and specialist physicians and rewarding and holding providers accountable for continuity of care. On the other hand, countries like Sweden and the Netherlands can learn from the U.S. on how to adequately coordinate care between primary care physicians, specialists, and hospitals.

Key messages:

- Investment in primary care yields better health outcomes, greater equity and lower costs.
- Many high-income countries in Europe have high performing primary care systems, something the U.S. system can learn from.

Abstract citation ID: ckae144.299

Preparedness and Public Health: an Italian Local Health Authority plan for a mass gathering in 2023

Lucia Lesa

L Lesa[1], G Longobardi[1], D Turello[2]
[1]Clinical Management Staff, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy
[2]Health Directorate, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy
Contact: lesalucia@gmail.com

Issue: Mass gatherings represent an important Public Health challenge. The increased number of people present in a specific area puts local health systems under stress (i.e.workload of emergency services, environmental health and food safety) and at the same time it rises the risks of a potential mass casualty incident. Effective planning and disaster preparedness have to be achieved through collaboration among local health authorities(LHA) and other stakeholders (event planners, law enforcement, local transportation services).

Problem: Every year, for 3 days, the Italian Alpine troops gather in a different city to remember First World War fallen. During those days, the city centre transit is not allowed to car (in specific areas even to emergency vehicles).In May 2023 this event occurred in Udine, a city in the North East of Italy with almost 100.000 inhabitants. For that year at least 300.000 participants were expected. LHA had to reorganize preparing itself to manage a temporary quadrupled catchment area.

Results: In the previous months, local authorities met local health representatives and other stakeholders in order to define a single emergency response plan. For healthcare services it was decided to: institute first aid points within the city; reorganise patients' emergency transport system; increase hospitals' treatment capacity (beds, life support equipment); increase healthcare professional availability; empower drugstores (opening times, drugs procurement); strengthen human and animal health surveillances;activate alternative communication systems. During the event, LHA updated other authorities involved three times a day about hospital and emergency system situation. At the end of the event,a multiprofessional debriefing meeting was held and no critical situations were reported.

Lessons: Preparedness requires a great commitment in terms of resources and time, but it is confirmed to be essential to guarantee adequate assistance even in extraordinary conditions.

Key messages:

- Mass gathering s events put under stress all the main areas of public health system.
- Public health preparedness cannot be effective without a strong involvement of other public and private stakeholders.

Abstract citation ID: ckae144.300

Emergency preparedness in healthcare systems: the "policy-effect" of COVID-19

Flavia Beccia

F Beccia[1], MG Cacciuttolo[1], S Farina[1], ML Specchia[1], G Damiani[1]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
Contact: flavia.beccia01@icatt.it

The COVID-19 pandemic has highlighted that health services preparedness is crucial. Indeed, effective planning enables streamline operations, optimized resource allocation, and transparent communication during crises. Within this context, our analysis aims to assess EU countries' healthcare systems preparedness, by policies analysis and capacity factor analysis, and relationship with COVID-19. We reviewed policies regarding influenza, antimicrobial resistance (AMR), and climate change in EU countries, using a web-screening of national and international authorities and institutions. Furthermore, we performed a factor analysis on WHO's States Party Self-Assessment Reporting (SPAR) and evaluated the results using an iterated principal factor analysis with promax rotation. Few countries updated their policies after the pandemic, particularly regarding influenza plans. Italy stands out as an exception, having updated its national plan in 2021, while other countries maintain pre-COVID plans. Regarding AMR, only few countries, including Sweden, Netherlands, Malta, Germany, Spain, Belgium, and France, updated their plans post-pandemic, while Estonia and Romania lack plans entirely. Addressing the climate crisis and its impacts on health and healthcare resilience, all EU countries aligned with the EC regulation on climate action through National Energy and Climate Plans in 2023. Moreover, EU countries had average preparedness level of 75.77 (SD: 8.23), calculated on SPAR 2022, with significant disparities. Three major factors contribute to preparedness levels: planning, service delivery, and specific subtopics (e.g. food safety, radiation, infectious diseases). Our findings reveal the complexity of preparedness, showing diverse approaches across countries, despite EU regulations and WHO guidelines. International collaboration is crucial to standardize policies and enable countries to leverage successful examples, improving public health outcomes.

Key messages:

- Health services preparedness, underscored by the COVID-19 pandemic, is crucial for effective planning and crisis management.
- The analysis demonstrates varying levels of preparedness across EU countries, with differences in policy updates and adherence to international guidelines.

5.I. Scientific session: Epidemiological insights into vaccine hesitancy in Europe: building bridges and overcoming barriers

Abstract citation ID: ckae144.301

Organised by: EUPHA-EPI, -ETH, -IDC, -HTA, Faculty of Public Health (UK)
Chair persons: Chiara de Waure (EUPHA-HTA), Farhang Tahzib (EUPHA-ETH)
Contact: angelo.pezzullo@unicatt.it

Vaccine hesitancy remains a pivotal challenge in public health, undermining immunization efforts and the containment of infectious diseases across Europe. This scientific session aims to dissect the complex nature of vaccine hesitancy, uncovering epidemiological trends and barriers to vaccine acceptance, particularly in diverse demographic contexts. The objective is to facilitate a comprehensive understanding among public health stakeholders and to foster actionable strategies through enriched dialogue and interaction. This session will delve into recent studies and projects that highlight the variability of vaccine hesitancy within Europe. First, an exploration of COVID-19 vaccine acceptance will reveal how sociodemographic factors influence vaccine-related behaviors across 20 European nations. This will be complemented by an analysis of targeted interventions designed to enhance vaccine uptake among migrant populations, drawing lessons from the RIVER-EU project. Additionally, a focus on national efforts to combat measles vaccine hesitancy will provide a case study on the challenges and successes in altering public health narratives. Based on the feedback received on last year's session, the format is intended not only to provide a platform to present empirical evidence and insights but also to encourage a participatory environment where attendees can exchange ideas and propose innovative solutions. For this reason, the session will engage the audience through an interactive discussion period at the end of each of the three presentations, stimulating thought-provoking dialogues that could lead to effective and innovative public health practices. Fostering international and interdisciplinary collaboration in the field of vaccine hesitancy is key for continued monitoring and reporting on the vaccine hesitancy phenomenon and inspiring actionable solutions.

Key messages:

- Sociodemographic factors are associated with vaccine hesitancy across Europe indicating the potential for targeted strategies.
- A platform to share insights and inspire actionable public health solutions to combat vaccine hesitancy amomg European public health professionals is needed.

Abstract citation ID: ckae144.302
Prevalence and sociodemographic correlates of COVID-19 vaccine acceptance in 20 European countries

Angelo Maria Pezzullo

AM Pezzullo[1], F Di Berardino[1], V Tricomi[1], S Boccia[1,2]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Woman and Child Health and Public Health, Fondazione Policlinico Universitario A. Gemel, Rome, Italy
Contact: angelo.pezzullo@unicatt.it

Our study aimed to analyze the prevalence and socio-economic factors associated with COVID-19 vaccine hesitancy using individual data from representative national samples of 20 European countries. Data from round 10 of the European Social Survey, collected from May 2021 to September 2022, were analyzed. Prevalence (with a 95% confidence interval (CI 95%)) of participants' intention to get vaccinated against COVID-19 was calculated. Crude differences in vaccine hesitancy proportions across sociodemographic strata were assessed using the Chi-square test. There were 31,771 adult participants (46.0 % men). The percentage of those hesitant (i.e. those who were not already vaccinated and intended not to be) toward the COVID-19 vaccine was 18.0% (CI 95% 17.6 - 18.4). Men and women were equally hesitant (18.0% vs. 18.0%, $p = 0.93$). There were differences between those under 40 (22.9%), adults between 40 and 59 (18.1%), and those over 60 (14.3%, $p < 0.001$). The unemployed had a higher proportion of hesitancy (32.9%) compared to the employed (17.4%), retirees (14.8%), and students (21.1%, $p < 0.001$). People living in rural areas have higher levels of hesitancy compared to those in urban areas (19.3% vs. 17.3%, $p < 0.001$). The estimates indicate that the highest prevalence of vaccine hesitancy was in Bulgaria (61.6%), Slovenia (40.4%) and Slovakia (30.7%), while Iceland (2.3%), Portugal (3.6%) and Italy (4.0%) had the lowest. Our study confirms high prevalence and high variability of hesitancy towards COVID-19 vaccines in Europe and identify groups for potential targeted interventions.

Don't pass me by: Tackling vaccine hesitancy among migrants via the RIVER-EU project

Maria Gańczak

M Ganczak[1], T Schloemer[2]
[1]Department of Infectious Diseases, Collegium Medicum, University of Zielona Gora, Zielona Gora, Poland
[2]Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands
Contact: m.ganczak@inm.uz.zgora.pl

Literature research has suggested that vaccination hesitancy (VH) has been increasing in recent years across migrant populations. It poses various challenges, including risks of outbreaks, and re-emergence of diseases. Nevertheless, only few studies provide an insight of the interventions successful in tackling VH among these groups. This presentation will describe a multi-country research enterprise that aims to respond to these needs. The "RIVER-EU - Reducing Inequalities in Vaccine uptake in the European Region - Engaging Underserved communities" project (funding from EU's Horizon 2020, Grant Agreement No. 964353) involves several underserved communities, such as Ukrainian migrants (UMs) in Poland, migrants and refugees in Greece, females with Turkish/Moroccan migration background in the Netherlands and the marginalized Roma communities in Slovakia. The project aims at improving child and adolescent HPV/MMR vaccination among these communities by implementing tailored interventions, suitable for each target country. The focus is on removing health system barriers to vaccination. The data regarding VH are an important by-product of the RIVER-EU project, and shows the connection between perceived access barriers and VH. A project-based approach to combat VH among UMs in Poland will serve as a case study to demonstrate the complex process of development of adequate interventions, that could be used to support this migrant group, with disturbingly low vaccination uptake. However, this presentation will go beyond this case study findings - a review of the existing evidence will help generalize our results. Overall, this presentation will show to how investigating various drivers of under-immunization helps to assess what approaches, strategies and interventions are effective to combat VH among marginalized migrant groups.

Abstract citation ID: ckae144.304
The Scourge of measles

Samia Latif

S Latif[1]
[1]Health Protection, UK Health Security Agency, London, UK
Contact: Samia.latif@ukhsa.gov.uk

Once considered a disease of the past, the resurgence of measles in England has garnered significant attention in recent weeks and months. The uptake of routine childhood vaccines including the measles, mumps and rubella (MMR) vaccine is the lowest it has been in a decade and is well below the 95% uptake needed to protect the population and prevent outbreaks. This is giving this serious disease a chance to get a foothold in our communities. From having never seen a case of measles in their life time doctors in England are now notifying cases of measles based on clinical suspicion. Since October, we have seen a rapid increase in both measles cases and outbreaks of measles across England (the total number of cases confirmed since October 2023 to date is 1109) and it has been declared a national incident. The abstract highlights the consequences of vaccine hesitancy, illustrated by case studies of outbreaks of measles among susceptible populations such as schools and prisons and the steps being taken to control the spread. Social media misinformation, distrust in healthcare authorities, and concerns over vaccine safety are some of the factors shaping parental attitudes towards MMR vaccination. In response to these challenges, the abstract underscores the importance of targeted interventions aimed at addressing vaccine hesitancy, such as community engagement initiatives, tailored communication strategies, and healthcare provider training. By emphasizing the critical role of MMR vaccination in preventing measles resurgence, this abstract advocates for a collaborative approach involving healthcare stakeholders, policymakers, and the public to combat to combat this preventable yet persistent threat to public health.

5.K. Scientific session: Health literacy in Ireland: A participatory action approach with Sláintecare Healthy Communities

Abstract citation ID: ckae144.305

Organised by: Dublin City University (Ireland)
Chair persons: Hannah Goss (Ireland), Talent Nyamakope (Ireland)
Contact: hannah.goss@dcu.ie

This workshop offers a comprehensive exploration of the dynamics, challenges, and opportunities surrounding health literacy in Ireland. In 2023, Dublin City University and Sláintecare Healthy Communities, driven by a commitment to foster equitable healthcare access and outcomes, embarked on a research project aimed at deciphering the intricacies of health literacy and its implications for public health in Ireland. The series of interactive presentations will transparently share learnings from the process and outcomes of this project, which can be applied across different sectors, contexts, and countries. The workshop will begin with an overview of the rationale underpinning Sláintecare Healthy Communities' engagement in this research project. This is one of the first pilot programmes of its kind. By transparently exploring the driving forces and strategic approaches of this organisation, participants will gain insight into the imperative of addressing health literacy from the perspective of a cross-government and multi-discipline initiative. Following from this, a series of presentations will detail the rigorous scientific approaches undertaken. This includes an umbrella review of international conceptualisations of health literacy and a systematic review of health literacy research conducted on the island of Ireland in the last decade. Findings from these reviews highlight the evolving challenges and emerging trends shaping health literacy practices nationally and internationally. It is also recognised that responsive health literacy development requires thoughtful involvement of diverse local communities. Programmes and actions that 'leave people behind' can exacerbate health inequalities. As a result, meaningful community based participatory research, including innovative design thinking approaches, were utilised throughout this project. The Sláintecare Healthy Communities Programme identified two contrasting areas to participate in this work, presenting both an urban and rural context. The health literacy strengths, needs and issues encountered in these communities will be presented in the community members own words. This workshop will close with the presentation of a series of co-designed, and crucially actionable, recommendations for evidence-based best practices in health literacy promotion in Ireland. Leveraging the synthesis of research findings and stakeholder insights, a number of actions aimed at enhancing health literacy proficiency and fostering health equity will be detailed. This presentation in particular will be interactive, and will challenge participants to identify health literacy promoting actions that may be suitable for their own contexts. This workshop offers a timely and pragmatic exploration of health literacy promotion in Ireland. By fostering dialogue, knowledge exchange, and collaboration, the workshop serves as a catalyst for transformative change, paving the way towards more inclusive, equitable, and health-literate societies, both in Ireland and beyond.

Key messages:

- This workshop offers a timely and pragmatic exploration of health literacy promotion in Ireland.
- Presenters from both practice and research will detail how the needs analysis was conducted, and how we suggest these co-designed recommendations can be actioned.

[2]Community Development Section, Mayo County Council, Mayo, Ireland
[3]Community, Social Development & Research, Dublin City Council, Dublin, Ireland
Contact: mcarney@mayococo.ie

This workshop will include a blend of presenters from both practice and research, with tangible examples of how the needs analysis was conducted, how meaningful partnerships were developed, and how we suggest these suggestions can be brought to life. This opening presentation will set the scene, detailing the role of Sláintecare Healthy Communities, the rationale for a focus on health literacy, the incredible value of adopting a meaningful participatory approach, and learnings from collaborating with a research team/project.

Abstract citation ID: ckae144.307
Contemporary understanding of health literacy across the Island of Ireland

Craig Smith

C Smith[1], M Murray[1,2], S Behan[1,2], H Goss[1]
[1]School of Health and Human Performance, Dublin City University, Dublin, Ireland
[2]Inisight Centre for Data Analytics, Dublin City University, Dublin, Ireland
Contact: craig.smith57@mail.dcu.ie

This presentation will detail two reviews that provided contextual understanding for this project. The first, an umbrella review which explored i) How is health literacy currently defined and operationalised nationally and internationally? And ii) What are the key components and principles of health literacy? The search was limited, most notably, to systematic reviews published after 2012. A total of 12 studies were included for data extraction and narrative analysis. Findings provided an update of the conceptual understanding of health literacy, emphasising the complex and multidimensional nature of the concept. Dimensions are common, but growing, and moving beyond just individual capabilities. The second, moving beyond the definition, details a systematic review that aimed to gain a contemporary understanding of health literacy through identifying and appraising existing research conducted in an Irish context. Seven electronic databases were searched between October and December 2023. Initial search identified 551 records, following screening, 37 studies were included in this review. Narrative analysis indicated that across the Island of Ireland in the last decade, many studies had narrow populations of focus (i.e. Dublin based, adults, chronic illness populations), limited research design and methodologies (cross-sectional, narrative, and primary research with short time frames), and lacked rigorous monitoring and evaluation of health literacy as a primary or secondary outcome. While studies highlighted clinical, education and community implications, a limited focus on mental health was also observed. Findings from this systematic review offer valuable insights and recommendations for future efforts to enhance health literacy and the health and well-being of individuals across the island of Ireland.

This presentation will showcase the importance of community based participatory research in developing health literacy in Ireland. Purposeful sampling ($n = 105$: 71% female) in two contrasting Sláintecare Healthy Community areas in Ireland (Finglas & Cabra and Mayo), recruited participants to take part in semi-structured focus groups, or individual interviews. Using reflective thematic analysis, and a critical friend approach, five key themes were identified that demonstrated the strengths, needs and challenges in health literacy in urban and rural communities in Ireland. This included: i) Accessing and understanding health information; ii) Health literacy changing over time; iii) Perceiving health literacy as an individual responsibility; iv) Interpersonal and community influences on health literacy; and v) Health access through a rural or urban infrastructure. There were many similarities between rural and urban, young and old. Equally, there were unique challenges that required local solutions. As such, the next phase of this project utilised a co-design process to check, challenge, collaborate and create recommendations for health literacy solutions in each case study area. A specific method of experience-based co-design, the Double Diamond Design Approach (DDDA) was used. With DDDA, stakeholders progress through a four-stage reflective process to discover, define, develop, and deliver an innovative solution to a problem. Two Co-design Workshops took place in March 2024 aiming to revise the strengths, barriers, needs, and propose potential recommendations for health literacy in each Sláintecare Healthy Community, using an adapted DDDA. Within the rural setting, solutions to promote health literacy spanned across transport, health access, and community based needs. Within an urban context specific suggestions around community engagement, information sharing, and earlier educational intervention were called for.

Abstract citation ID: ckae144.309
Co-designing health literacy actions: Connecting the dots to create meaningful impact

Stephen Behan

S Behan[1,2], B Geoghegan[3,4]
[1]School of Health and Human Performance, Dublin City University, Dublin, Ireland
[2]Inisight Centre for Data Analytics, Dublin City University, Dublin, Ireland
[3]Slaintécare Healthy Communities, Slaintécare, Waterford, Ireland
[4]Community, West Meath County Council, West Meath, Ireland
Contact: stephen.behan@dcu.ie

In closing the workshop, this presentation will bring together the participatory research recommendations for promoting and developing healthy literacy in Ireland, which will be led by Slaintécare Healthy Communities in practice, dissemination and scale up. In particular, a worked example from a third Slaintécare Healthy Community (Westmeath) will be presented; a healthy literacy "Train the Trainer" professional development course for local health literacy champions. In this presentation, we will also challenge attendees to offer suggestions of how to support and facilitate other recommendations suggested by our participants, and invite them to consider how this participatory action approach to a health literacy needs analysis could be utilised in their own contexts.

5.L. Round table: Gaining or losing ground? Leveraging social innovation to improve abortion access in Europe

Abstract citation ID: ckae144.310

Organised by: Technical University of Berlin (Germany), Escola Nacional de Saude Publica (Portugal)
Chair persons: Liz Farsaci (Ireland), Astrid Eriksen (Germany)
Contact: katherine.polin@gmail.com

Sexual and reproductive health services are fundamental to ensuring a wide range of human rights, including the right to health. This includes guaranteeing access to abortion care, which international human rights bodies and the World Health Organization have recognised as a critical component of states' obligation to respect and ensure human rights. Abortion regulation in Europe continues to evolve along a continuum from restrictive to liberal. For decades, the legislative trend across Europe has been towards the expansion of entitlements to abortion, and the repeal of legal and policy restrictions. In the last ten years, over 15 European countries have undertaken reforms to modernize their laws, including Belgium, France, Ireland, the Netherlands, and Spain. Currently, new progressive reforms are being considered in several countries. However, more restrictive reforms have also been adopted. Health system structures and sociopolitical, cultural, ethical, and moral dimensions shape access to abortion services, while abortion regulation often causes tensions in countries. The landscape is complex, with debates over legalisation and decriminalisation of abortion, and the procedural steps to ensure service provision. Differences in regulation across and within countries result in myriad access inequalities. Understanding abortion regulation in Europe is vital to assessing service equity and access. Exploring the sociopolitical contexts of abortion helps identify potential actions for ensuring access to abortion care. In exploring the range of potential actions, we focus on social innovation, i.e., new social practices to better meet social needs and the processes undertaken to get there. The country expert (HSPM) network of the European Observatory has launched a cross-country study of the state of abortion services in 19 high-income countries since 2018. This workshop will outline the legal, regulatory, service-delivery, and sociopolitical contexts of abortion in Europe, identifying challenges to access. It will take recent experiences in Germany, Ireland, and Portugal to examine differential access, ongoing political debates, and social positioning of abortion in Europe, and as a springboard to discuss the role of social innovation in shaping legal and regulatory changes. Lastly, this workshop will explore how the public health research community can contribute to evidence-based abortion policymaking and implementation. This interactive workshop will start with a presentation of findings from the European Observatory's cross-country comparison. Then, country experts from the 3 case studies and a representative from the Center for Reproductive Rights will examine the sociopolitical environment of abortion policymaking in Europe. Discussion with audience interventions will reflect on opportunities for social innovation and movement building toward better access to abortion care in Europe and explore the role of the public health research community.

Key messages:

- European abortion laws constantly evolve with a prevalent legislative trend towards expanding access and removing barriers; social innovation can be a lever to progressive law and policy reforms.
- In all countries, those seeking abortion care continue to experience multiple access barriers, including those related to policy, regulation, financing, geography, and culture.

5.M. Oral presentations: Addressing mental health

Abstract citation ID: ckae144.311

Longitudinal association between nonstandard work schedule and depressive symptoms

Chioma Nwaru

C Nwaru[1], V Albani[1], C McNamara[1], M Bertilsson[2], C Bambra[1]
[1]Population Health Sciences Institute, Newcastle University, Newcastle Upon Tyne, UK
[2]School of Public Health & Community Medicine, University of Gothenburg, Gothenburg, Sweden
Contact: chioma.nwaru@newcastle.ac.uk

Background: Nonstandard work schedules (NSWSs) have been linked to increased risk of depression, but the evidence is mostly from cross-sectional studies and data on the risk distribution across various groups is lacking. We examined the impact of different NSWSs on depressive symptoms and assessed effect modification by sex, ethnicity, and immigrant status.

Methods: We used five waves of longitudinal data from the Understanding Society, the UK Household Longitudinal Study, which were collected biennially from 2010/11 to 2018/19. The study sample comprised 11371 employed workers aged 16 to 58 years in 2010/11. Generalised estimating equation with logistic regression was used to assess crude and adjusted effects of NSWS types (work time arrangement, work hours, and weekend working) on depressive symptoms. Independent correlation was specified in all the models. Complete-case and multiple imputation analyses were performed.

Results: After adjusting for confounders, only weekend work was associated with depressive symptoms. Workers who worked most/all (OR 1.24; 95%CI 1.13 - 1.37) or some (OR 1.10; 95%CI 1.02 - 1.18) weekends had a higher risk of depressive symptoms than workers who did not work on weekends. Ethnicity modified the association between work hours and depressive symptoms, indicating a higher risk among White workers working $>$ 40 hours/week (OR 1.10; 95%CI 1.02 - 1.20) and Asian workers working $<$35 hours/week (OR 1.72; 95%CI 1.32 -

2.25) compared to White workers working 35-40 hours/week. No effect modification by sex or immigrant status was observed. The results were the same as those obtained from the imputation model.

Conclusions: Weekend work, long work hours (for White workers), or working < 35 hours/week (for Asian workers) were associated with increased risk of depressive symptoms. These findings indicate the need to review the working conditions of workers exposed to NSWSs, especially those working on weekends and Asian workers who work part-time.

Key messages:

- Weekend work schedule is associated with an increased risk of depressive symptoms among employed workers in the UK.
- The effect of work hours on depressive symptoms varies by ethnicity.

Abstract citation ID: ckae144.312
Using Machine Learning to identify the social determinants of the mid-life decline in mental health

Christoph Henking

C Henking[1]
[1]Department of Social Policy and Intervention, University of Oxford, Oxford, UK
Contact: c.henking@gmx.net

Background: The mid-life decline in mental well-being, depicted as a U-shaped pattern, is debated across disciplines. This study seeks to identify the social determinants of this decline and the overall contribution of social determinants to changes in mid-life mental health.

Methods: We use data from the 1970 British Cohort Study, from the ages 26, 34, and 42 (N = 6992, 51.5% female). Mental distress was measured using the 9-score Malaise Inventory. Mental distress increased from age 34 (M = 1.67) to 42 (M = 1.86; p < 0.001), with 17.8% declining by at least 1 SD on the inventory. We contrasted this group of decliners with those exhibiting stable mental health. We included socioeconomic and family factors, as well as physical health and health behaviours as potential determinants of mental health decline (at ages 26, 34, or at birth). We combine Random Forest and logistic regressions.

Results: The Random Forest's Variable Importance (VI; root Mean Squared Error (MSE)), revealed social class at birth (VI = 0.023), physical multimorbidity at age 26 (VI = 0.22), and income quintile at age 34 (VI = 0.022) as most important predictors. Regressions confirmed that low birth social class (OR = 1.51 [1.25-1.83]), high-income at age 34 (OR = 0.68 [0.53-0.88]), and physical multimorbidity at age 26 (OR = 1.25 [1.06-1.48]) predict mental health decline. For those with high income and social class, the predicted probability of mid-life mental health decline is 0.109 (CI = [0.08-0.139]), rising to 0.277 (CI = [0.227-0.324]) for high risk individuals. Social class does not predict changes in mental health between ages 26 - 34.

Interpretation: We show that various social determinants of health contribute to the observed decline in mental health during mid-life. Social class at birth, income, and physical health are the most relevant predictors; they reduce the risk of decline from up to 27% to 11%. The contribution of social class appears specific to mid-life, and it could help explain the U-shaped pattern.

Key messages:

- Social Factors Matter: Social class, income, and health predict mid-life mental decline.
- Mid-life Class Impact: Social class uniquely affects mental health decline in mid-life.

Abstract citation ID: ckae144.313
Exploring the association between low birthweight and adolescent mental health in the United Kingdom

Ciara Carroll

C Carroll[1,2], *M Keller*[2]

[2]Usher Institute, University of Edinburgh, Edinburgh, Ireland
Contact: ciara.carroll2@hse.ie

Low birthweight (LBW) is associated with a range of medical conditions including behavioural and emotional problems over the life course. This study aimed to explore the association between LBW and internalising and externalising mental health problems (MHP) in adolescents born in the United Kingdom between 2000 and 2002. Data were analysed for 10,485, 9,228, and 8,402 Millennium Cohort Study participants at ages 11, 14 and 17, respectively. Internalising and externalising MHP were measured using the Strengths and Difficulties Questionnaire (SDQ). LBW was subcategorised by size for gestational age and prematurity. Crude and adjusted associations between LBW subgroup and internalising and externalising MHP were estimated using binary logistic regression. Internalising MHP were more prevalent in LBW than NBW participants at ages 11 (14.2% vs 10.3%, p < 0.001), 14 (19.4% vs 13.7%, p < 0.001), and 17 (parent-report: 20.3% vs 14.8%, p < 0.001; self-report: 25.7% vs 20.1%, p < 0.001), respectively. Externalising MHP were more common amongst LBW participants at ages 11 (9.4% vs 7.3%, p = 0.02) and 14 (9.0% vs 6.6%, p = 0.01). Compared with NBW peers, the odds of internalising (males: aOR 2.18, 95% CI 1.21-3.73, p = 0.007; females: aOR 2.17, 95% CI 1.22-3.66, p = 0.005) and externalising MHP (males: aOR 2.01, 95% CI 1.05-3.60, p = 0.014; females: aOR 2.58, 95% CI 1.14-5.24, p = 0.016) were significantly increased in male and female premature small for gestational age (SGA) participants at age 11. Externalising MHP were significantly increased amongst premature SGA females aged 14 (aOR: 2.53, 95% CI 1.01-5.66, p = 0.016). Internalising MHP were significantly increased in premature SGA females at age 17 based on parent (aOR: 2.41, 95% CI 1.38-4.22, p = 0.005) and self-report (aOR: 1.95, 95% CI 1.14-3.31, p = 0.014). Amongst LBW individuals, premature SGA females have the greatest risk of internalising and externalising MHP during adolescence, thus identifying an important target group for intervention.

Key messages:

- This study provides evidence for the longitudinal association between low birth weight and mental health in adolescents born in the United Kingdom in the 21st century.
- Stratification of low birth weight individuals by size for gestational age and prematurity enabled the identification of a subgroup of adolescents for mental health promotion.

Abstract citation ID: ckae144.314
Factors of mental health patients' uptake in social prescribing: a mixed methods study in Portugal

Louíse Hoffmeister

L Hoffmeister[1,2], *A Gama*[1,2], *B Gonçalves*[1,2], *AM Canas*[1,2],
C Figueiredo[1,2], *S Dias*[1,2]
[1]NOVA National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
[2]Public Health Research Center, Comprehensive Health Research Center, REAL, Lisbon, Portugal
Contact: lv.hoffmeister@ensp.unl.pt

Successfully addressing mental health challenges demands comprehensive, community-driven solutions. Social prescribing (SP) emerges as an innovative approach, fostering integrated care by connecting healthcare patients to community resources. Research in this topic proved effects of SP in mental health and well-being promotion, but factors influencing patients' uptake remain underexplored. This study examined the factors associated with the uptake in patients with mental health needs in SP project in Portugal. This mixed methods study examined registries data of 403 patients referred to SP for mental health needs. A logistic regression was used to analyse sociodemographic characteristics and referral details associated with SP uptake. Semi-structured interviews were conducted with stakeholders to explore challenges and facilitators of users uptake. Most users were female (71.7%) and elder (average age 64.4 years, SD ± 20.0). Mental health needs included social isolation, loneliness, anxiety, and depression. 43.7% of referred patients had diagnosed mental illnesses and 55.8% attended at least one SP appointment. SP uptake was more likely among patients referred for social and financial support (OR 2.02; 95%CI 1.32-3.07; $p = 0.001$) and referred during the Covid-19 period (OR 1.64; 95%CI 1.08-2.49; $p = 0.020$). increased the probability of SP uptake. In contrast, SP uptake was less likely among those having diabetes (OR 0.49; 95%CI 0.28-0.88; $p = 0.016$). Health professionals' proactive engagement with patients facilitated uptake in SP, yet challenges arose from users' complex needs, low awareness, motivation, and acceptance of non-traditional responses such as community-based activities, along with mistrust of their effectiveness. SP has the potential to foster mental health and well-being through person-centred holistic care, yet challenges in uptake related to health and psychosocial factors must be addressed to optimize the SP positive impacts.

Key messages:

- Factors influencing the uptake of patients with mental health needs in SP initiative in Portugal involved need of social and financial support, pandemic period and health professionals' attitudes.
- Despite SP potential, for effective implementation it is key to address challenges, like complexity of patients' needs, awareness gaps and patient mistrust, to maximize its positive outcomes.

Abstract citation ID: ckae144.315
Trends in the association between alcohol use and generalized anxiety in Finnish adolescents

Noora Berg

N Berg[1,2], *O Kiviruusu*[1]
[1]Department of Public Health and Welfare, THL, Helsinki, Finland
[2]Institute for Molecular Medicine Finland, University of Helsinki, Helsinki, Finland
Contact: nojoberg@gmail.com

Background: During the past two decades, alcohol use has decreased among adolescents, but on the contrary, anxiety symptoms have increased (at least among females). These diverging trends set interesting opportunities to examine whether the strength of the well-known correlation/co-occurrence between alcohol use and anxiety has also changed. This study aims to examine changes in the co-occurrence and associations between heavy episodic drinking (HED) and generalized anxiety among adolescents in Finland from 2013 to 2023.

Methods: Data from the Finnish School Health Promotion Study between 2013-2023 covered 874 110 participants aged 13-20. Generalized anxiety was measured using Generalized Anxiety Disorder Scale (GAD-7) (range 0-21), and heavy episodic drinking was measured as reported heavy drunkenness once a month or more often versus less than once a month. Yearly prevalence estimates of co-occurrence were analyzed for those with moderate to severe anxiety symptoms (>10) and monthly or more frequent HED. Associations between anxiety and HED were analyzed using logistic regression and time-varying effect modelling. Interactions between time and anxiety predicting HED were also considered.

Results: The moderate to severe anxiety symptoms increased from 10.7% to 20.9% and HED decreased from 18.0% to 11.8% between 2013 and 2023. The proportion of those with both HED and moderate to severe anxiety increased from 2.9% in 2013 to 3.6% in 2023. The association between anxiety symptoms and HED was stable during the study period, with odds ratios ranging between 1.06 and 1.07.

Conclusions: During the past decade, diverging trends in generalized anxiety symptoms and heavy episodic drinking have not changed the association between them. The proportion of adolescents with these co-occurring health concerns has increased in females. This calls for continuous efforts to strengthen the integration of mental health and substance use prevention and services.

Key messages:

- The association between generalized anxiety and heavy episodic drinking has not changed in adolescents in Finland between 2013 and 2023.
- The proportion of those with both moderate to severe anxiety symptoms and heavy episodic drinking has increased in females and remained stable in males during the past decade (2.9% - 3.6%).

5.N. Pitch presentations: Mother and child health

Abstract citation ID: ckae144.316
Birth registry-based cohort study of COVID-19 in pregnancy and adverse maternal outcomes in Georgia

Natia Skhvitaridze

N Skhvitaridze[1,2,3], *A Gamkrelidze*[1], *T Manjavidze*[1,2,3], *T Brenn*[2], *C Rylander*[2], *R Getsadze*[4]

[2]Department of Community Medicine, UiT The Arctic University of Norway, Tromso, Norway
[3]National Center for Disease Control and Public Health, Tbilisi, Georgia
[4]Division of Science and Mathematics, NYU Abu Dhabi, Abu Dhabi, UAE
Contact: natiaskh@yahoo.com

Georgia experienced an increase in maternal deaths (MD) during the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) pandemic, which warrants further investigation. This study aimed to assess associations between timing of SARS-CoV-2 infection during pregnancy and MD, post-delivery intensive care unit (ICU) admission, and caesarean section (CS) delivery. We performed a national birth registry-based cohort study of pregnant women who had completed 22 weeks of gestation and delivered between February 28, 2020, and August 31, 2022. The data were linked to coronavirus disease 2019 (COVID-19) testing, vital, and immunization registries. Pregnant women were classified into three groups: confirmed SARS-CoV-2 infection from conception through 31 days before delivery; confirmed infection within 30 days before or at delivery; and women negative for SARS-CoV-2 infection or without any test results (reference group). Multivariable logistic regression was used to calculate the adjusted odds ratios (aORs) and 95% confidence intervals (CIs). Among 111,493 pregnant women, 16,751 had confirmed infection during pregnancy, and 7,332 were fully vaccinated against COVID-

19 before delivery. Compared to the reference group, those with confirmed infection within 30 days before or at delivery experienced increased odds of MD (aOR: 43.11, 95% CI, 21.99-84.55), post-delivery ICU admission (aOR: 5.20, 95% CI, 4.05-6.67), and CS delivery (aOR: 1.11, 95% CI, 1.03-1.20).

Key messages:

- Pregnant women in Georgia with confirmed SARS-CoV-2 infection within 30 days before or at delivery experienced a considerably higher risk of MD and post-delivery ICU admission.
- Most pregnant women were not vaccinated against COVID-19 and these findings should alert stakeholders that adherence to public health preventive measures needs to be improved.

Abstract citation ID: ckae144.317
Vitamin D status and its determinants in pregnant women form the Faroe Islands

Background: In regions like the Faroe Islands, where sunlight may be insufficient for vitamin D synthesis, alternative sources such as diet and supplements become crucial. This study focuses on assessing the vitamin D status of pregnant women in the Faroe Islands during the early second trimester, considering the potential implications for maternal and fetal health.

Methods: A nationwide cross-sectional study (June 2020-April 2022) with 652 women providing blood samples and a questionnaire on demographics, vitamin D intake, and diet. Binary logistic regression assessed predictors of low 25-hydroxyvitamin D (25OHD) levels (<50nmol/L). Plasma 25OHD concentrations were analysed at the local National Hospital using the Alinity i 25-OH Vitamin D assay, employing chemiluminescence microparticle immunoassay (CMIA) for quantitative determination.

Results: The mean age was 30.7 (SD, 4.9) years; 86% were locally born; 45% resided in the capital area; 49% were overweight (BMI ≥25.0), with a mean pre-pregnancy BMI of 26.0. Most participants (95%) reported vitamin D intake (median of 10μg/day) and consumed vitamin D-rich foods 5.3 times per week. Low 25OHD concentrations were observed in 26% of participants, associated with residency, vitamin D intake, dietary habits, overweight, and sampling time. Maternal age, education, BMI, smoking, and traditional food showed no significant associations. During winter, vitamin D intake correlated more strongly with plasma 25OHD levels (Spearman's rho, winter: 0.4, $p < 0.001$; summer: 0.2, $p = 0.002$).

Conclusions: Our study's findings are essential for the health of Faroese pregnant women. 74% of them had sufficient 25OHD levels, which is encouraging. However, low levels were associated with residence, diet, overweight, and winter. This underscores the need for public health efforts to focus on monitoring vitamin D status, promoting vitamin D-rich foods, especially in winter, and monitoring dietary intake to protect maternal and fetal health.

Key messages:

- No previous data on vitamin D status in Faroese pregnant women.
- Seasonal variation is observed.

Understanding and monitoring vulnerability during pregnancy at population-level

Joyce Molenaar

J Molenaar[1,2], *J Struijs*[1,2], *JC Kiefte-de Jong*[2]
[1]Population Health and Health Services Research, RIVM, Bilthoven, Netherlands
[2]Health Campus the Hague, Leiden University Medical Centre, The Hague, Netherlands
Contact: joyce.molenaar@rivm.nl

Background: Detecting and addressing vulnerability during pregnancy is important to optimize the first thousands days of children's lives and prevent health inequities. We aimed to gain insight into vulnerability during pregnancy and determine the best data to predict vulnerability.

Methods: In the Netherlands, two studies were done using nationwide routinely collected data and self-reported Public Health Monitor-data. The first study utilized all data to identify classes of vulnerability among 4172 pregnant women through Latent Class Analysis. The second study predicted multidimensional vulnerability at population-level using solely routinely collected data first, and step-by-step incorporating self-reported data. Random Forest (RF) analysis was employed, and model performance was assessed using Area Under the Curve (AUC) and F1-measure.

Results: Five vulnerability-classes were found: 'healthy and socioeconomically stable', 'high care utilization', 'socioeconomic vulnerability', 'psychosocial vulnerability', and 'multidimensional vulnerability'. Women in the 'multidimensional vulnerability'-class shared multiple risk factors across domains and lacked protective factors. They more often had adverse outcomes such as premature birth. In the next study, the initial RF-model achieved an AUC of 0.98 in distinguishing multidimensional vulnerability, with an F1-measure of 0.70. Adding self-reported data improved model performance. Strong predictors were self-reported health, socioeconomic characteristics and healthcare utilization.

Conclusions: Several vulnerability classes can be distinguished among pregnant women. The co-existence of risk factors and lack of protective factors leads to more adverse outcomes. Effective public health strategies should include both medical and social care and support. Next, it seems possible to predict multidimensional vulnerability using data that is readily available, providing a foundation for longitudinal monitoring and policy formulation.

Key messages:

- Considering the combination of both social risk and protective factors related to vulnerability during pregnancy is necessary.
- Routinely collected data could provide insight in the prevalence, geographical distribution and trends in multidimensional vulnerability during pregnancy at population-level.

Abstract citation ID: ckae144.319
Non-genetic risk factors for preeclampsia: an updated umbrella review

Konstantinos Giannakou

[3]Department of Medicine, European University Cyprus, Nicosia, Cyprus
Contact: K.Giannakou@euc.ac.cy

Background: Preeclampsia (PE) is a common pregnancy disorder with complex mechanisms, and multiple risk factors may contribute to its development. Our objective is to update our literature search from our previous umbrella review, summarizing recent evidence on non-genetic risk factors associated with PE and assessing their credibility to identify those supported by robust epidemiological evidence.

Methods: We searched PubMed, EMBASE, Scopus, and ISI Web of Science up to June 2023. For each meta-analysis, we computed summary effect estimates, 95% confidence intervals, 95% prediction intervals, and assessed heterogeneity using I^2, while also examining small-study effects and excess significance bias. Quality assessment was conducted using the AMSTAR-2 tool.

Results: 89 meta-analyses were identified, providing data on 219 associations. Of these, 151 (69%) showed statistically significant findings at $P < 0.05$, with 52 (24%) remaining significant at $P < 10\text{-}6$. Large or very large heterogeneity was observed in 121 (55%) associations. Evidence for small-study effects and excess significance bias was found in 27 (12%) and 29 (13%) associations, respectively. Only 16 (7%) presented convincing evidence: Polycystic Ovary Syndrome (PCOS), PCOS (adjusted), Obstructive Sleep Apnea (OSA), Obesity (adjusted), Chronic Kidney Disease (CKD), Pregnancy Intrahepatic Cholestasis, SARS-CoV-2 infection (adjusted), Oocyte donation (OD) vs. In vitro fertilization (IVF), Fresh embryo transfer vs. spontaneous conception (SC) (singleton), Frozen embryo transfer vs. SC, OD vs. SC (singleton), IVF-OD vs. IVF-AO, IVF-OD fresh ET vs. IVF-AO fresh ET, NC frozen embryo transfer vs. AC frozen embryo transfer, Fetal sex (term), and Smoking.

Conclusions: Maternal health conditions like PCOS, along with reproductive interventions such as OD and IVF, as well as lifestyle factors like obesity and smoking, showed convincing associations with PE.

Key messages:

- Maternal health conditions, reproductive interventions, and lifestyle factors showed compelling evidence of association with preeclampsia.
- Our findings emphasize the multifactorial nature of preeclampsia and suggest potential avenues for further research and clinical intervention.

Abstract citation ID: ckae144.320
Associations between maternal origin, breastfeeding and health service use: a mediation analysis

Idil Muhumed

I Muhumed[1], *J Meinilä*[1], *R Klemetti*[2], *F Adebayo*[1], *S Virtanen*[2], *M Erkkola*[1]
[1]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland
[2]THL, Helsinki, Finland
Contact: idil.muhumed@helsinki.fi

Background: The influence of maternal health utilization on breastfeeding practices is well established. However, research shows that immigrant women tend to face challenges in accessing maternal health services. Our aim was to examine any variation in maternal and child health service utilization between immigrant and native-born mothers as well as to examine potential mediation roles of service utilization on the association between maternal origin and breastfeeding practices.

Methods: We used a nationwide FinChildren (2020) survey on parents with infants focusing on Somali ($n = 29$), Arabic ($n = 81$) and Russian speaking ($n = 181$) parents and their infants. We compared them with native Finnish speakers ($n = 7508$). We used Process Macro to conduct mediation analysis.

Results: Almost 25%/ of Somali-/Arabic-speaking mothers reported not taking their infants to routine child health clinic visits. The proportion was 0.4% for native-born mothers and 1.6% for Russian-speaking mothers ($p < 0.001$). Around 18% of Somali-/Arabic-speaking mothers and only 0.6% of the native-born mothers reported not utilizing child health clinic services in the past year ($p < 0.001$). Somali-/Arabic speaking mothers were more likely to receive breastfeeding support from maternity clinics and native-born mothers from maternity hospital or peer support groups. Russian-speaking mothers were most satisfied with the received child healthcare services while Somali/Arabic-speaking mothers were least satisfied with these services ($p < 0.001$). Only participating in breastfeeding peer support groups had mediation effects on association between maternal origin and breastfeeding practices.

Conclusions: This study shows that immigrants mothers, particularly Somali/Arabic speaking mothers use less the maternal health services particularly routine health visits. It is essential to encourage them to use the services to be able to monitor the health of both mother and the child.

Key messages:

- Somali-/Arabic-speaking mothers are in a vulnerable position when it comes to utilizing healthcare services.
- This study call for more research exploring factors contributing to this.

[6]School of Law, University College Cork, Cork, Ireland
Contact: s.leitao@ucc.ie

Background: Pregnancy loss affects approximately one in four pregnancies. The workplace is an important context to consider in pregnancy loss experiences as most women of reproductive age are in paid employment. Currently in the Republic of Ireland (ROI) there are no statutory leave entitlements if a pregnancy ends <24 weeks. Given the lack of research in this area internationally, we aimed to explore workplace experiences of early pregnancy loss.

Methods: In 2023, we conducted an online mixed-methods survey study (Mar-Apr), followed by qualitative interviews (Jun-Sept). People who experienced a pregnancy loss <24 weeks-whilst working and living in ROI in the preceding five years-were eligible to participate. The survey was distributed through professional/social networks and contained quantitative and qualitative questions-addressing pregnancy loss, experiences of workplace supports, and desired supports. Survey participants were asked to indicate their willingness to participate in a follow-up interview and were purposively sampled. The interview topic guide focused on specific aspects of workplace experiences which required further exploration following preliminary analysis of survey responses. Qualitative data were analysed in NVivo using reflexive thematic analysis.

Results: Most survey participants ($N = 913$) were female (74%), employed full-time (86%) and experienced a first-trimester miscarriage (75%). We conducted interviews with 13 people, across a range of demographics. Three initial themes were identified: (1) Personal experiences of pregnancy loss and dealing with emotional and physical impacts at work; (2) Challenges with the social side of pregnancy loss-disclosure and workplace interactions; (3) Workplace supports (4) Public policy and awareness.

Conclusions: Our analysis highlights the need for statutory leave, appropriate workplace policies and procedures, and education and training to better support workers who experience pregnancy loss.

Key messages:

- There is a gap between workers' needs and workplace supports regarding pregnancy loss <24 weeks gestation. Statutory leave, workplace policies and procedures, and education and training, are needed.
- There is a need to discuss pregnancy loss in workplaces and society, to raise awareness and reduce the stigma/taboo on the topic. Recognition from Government is crucial to promote this.

5.O. Scientific session: Exploring incidence and access to care for migrants and ethnic minorities with long-COVID

Abstract citation ID: ckae144.322

Organised by: University of Copenhagen (Denmark)
Chair persons: Marie Nørredam (Denmark), Charles Agyemang (Netherlands)
Contact: mano@sund.ku.dk

The COVID-19 pandemic disproportionately affected migrants and ethnic minorities throughout Europe leading to the assumption that long-COVID would also affect these groups to a larger extent than the majority populations. So far, the few studies on long-covid including data on migrants and ethnic minorities suggest that they are also disproportionately impacted by long-covid, but conclusive findings are lacking in European countries and beyond. However, a large number of migrants and ethnic minorities suffering from long-COVID is a major concern for equity in health. Given that migrants and ethnic minorities are more likely to experience barriers to health services, it may also be the case in terms of their ability to access services for long-covid. This would have an unknown impact on long-COVID related. Further, long-COVID may have more far-reaching implications among these populations as they are often more socio-economically vulnerable, holding more temporary jobs with a greater job insecurity. Consequently, unattended long-COVID among migrants and ethnic minorities is likely to exacerbate existing social inequalities and inequalities in health. The aim of the workshop is therefore to discuss different novel perspectives on long-COVID among migrants and ethnic minorities to share their insights from recently published or upcoming studies with leading scientific researchers on the topic. We include both qualitative and quantitative studies focusing on both the incidence and risk factors and on experiences with diagnostic pathways in accessing health care services for long-COVID. We have invited four researchers representing four different European countries to obtain a diversity of perspectives with different country contexts. The format of the workshop is a scientific session. After an introduction by the chair, four researchers will present new studies and different perspectives on long-COVID among migrants and ethnic minorities. Each presenter will have 7 min for presentation and 3 minutes for questions. After the presenters there are 20 minutes for discussion headed by the co-chair.

Key messages:

- Document and discuss the effect of the pandemic regarding long-COVID on some of the most hard hit populations.
- Lessons learned that can inform future pandemic policy and structural efforts to reach the most vulnerable.

Abstract citation ID: ckae144.323

Experiences of access to care, diagnosis and rehabilitation among a multiethnic patient population with long-COVID in Denmark

[4]Department of Public Health, University of Stockholm, Stockholm, Sweden
Contact: maria.goldschmidt@sund.ku.dk

Background and aim: The aim of the study was to explore the experiences of accessing care, diagnosis, and rehabilitation among patients with long-COVID in a multiethnic population in Denmark.

Methods: Qualitative research using semi-structured interviews among a purposive sample of 18 people diagnosed with long-COVID, according to the NICE guideline, in the Capital Region of Denmark. Participants were sampled to secure variation in sex, age, ethnicity, migration status and education. Our interview guide was developed using the theoretical framework of candidacy. Interviews were transcribed verbatim, and member checked, and subsequently analyzed using thematic framework analysis and NVivo software.

Results: The analysis generated four categories: i) living with long-COVID, ii) access to care, iii) experiences in the healthcare system, and iv) experiences with rehabilitation. A main category was identified from these categories: limited knowledge of COVID resulting in uncertainty, which challenged nearly all aspects of access to diagnosis, care and rehabilitation among the informants. In particular, ethnic minorities experienced that their motives for seeking care were questioned or had the experience of differential treatment. In general, participants perceived to be themselves responsible of recovering, while also struggling with the mental, social and work-related consequences of their long-COVID.

Conclusions: Our study demonstrated how the emergence of a new viral disease with unknown long-term sequelae results in a group of patients who to a great extend carry the burden of getting better themselves. More research into relevant diagnosis, care and support for long-COVID patients is needed, especially among ethnic minorities.

Abstract citation ID: ckae144.324

Risk of long COVID and associated symptoms after acute SARS-COV-2 infection in ethnic minorities: a Danish nationwide cohort study

George Mkoma

G Mkoma[1], M Goldschmidt[1], J Holm Petersen[1], T Benfield[3], A Cederström[4], M Rostila[4], C Agyemang[2], M Norredam[1,3]

[2]Amsterdam University Medical Centres, University ofAmsterdam, Amsterdam, Netherlands
[3]Department of Infectious Diseases, Copenhagen University Hospital Hvidovre, Copenhagen, Denmark
[4]Department of Public Health, University of Stockholm, Stockholm, Sweden
Contact: gefm@ssi.dk

Background and aim: Ethnic minorities living in high-income countries have been disproportionately affected by COVID-19 in terms of infection rates, hospitalisations, and deaths; however, less is known about long COVID in these populations. Our aim was to examine the risk of long COVID and associated symptoms among ethnic minorities.

Methods: We used Danish nationwide register-based cohort data on individuals diagnosed with COVID-19 aged ≥18 years (n = 2 334 271) between January 2020 and August 2022. We calculated the risk of long COVID diagnosis and long COVID symptoms among ethnic minorities compared with native Danes using multivariable Cox proportional hazard regression and logistic regression, respectively.

Results: Of the diagnosed COVID-19 cases, 1 973 998 (84.6%) were native Danes and 360 273 (15.4%) were ethnic minorities. After adjustment for age, sex, civil status, education, family income, and Charlson comorbidity index, ethnic minorities from North Africa (adjusted hazard ratio [aHR] 1.41, 95% CI [1.12,1.79]), Middle East (aHR 1.38, 95% CI [1.24,1.55]), Eastern Europe (aHR 1.35, 95% CI [1.22,1.49]), and Asia (aHR 1.23, 95% CI [1.09,1.40]), had significantly greater risk of long COVID diagnosis than native Danes. In the analysis by largest countries of origin, the greater risks of long COVID diagnosis were found in Iraqis (aHR 1.56, 95% CI [1.30,1.88]), Turks (aHR 1.42, 95% CI [1.24,1.63]), and Somalis (aHR 1.42, 95% CI [1.07,1.91]). A significant factor associated with an increased risk of long COVID diagnosis was COVID-19 hospitalisation.

Conclusions: Migrants and ethnic minorities had higher risk of long-COVID compared to native Danes.

Differences in incidence, nature of symptoms, and duration of long COVID among hospitalised migrant and non-migrant patients in the Netherland: a retrospective cohort study

Felix Chilunga

F Chilunga[2], *B Appleman*[2], *M van Vugt*[2], *K Klaverda*[2], *P Smeele*[2], *J van Es*[2], *WJ Wiersinga*[2], *M Rostila*[1], *M Prins*[2], *K Stronks*[2]
[1]Department of Public Health, University of Stockholm, Stockholm, Sweden
[2]Amsterdam University Medical Centres, University of Amsterdam, Amsterdam, Netherlands
Contact: f.p.chilunga@amsterdamumc.nl

Background and aim: Comprehensive data on long-COVID across ethnic and migrant groups are lacking. We investigated incidence, nature of symptoms, clinical predictors, and duration of long-COVID among COVID-19 hospitalised patients in the Netherlands by migration background.

Methods: We used COVID-19 admissions and follow up data (January 2021-July 2022) from Amsterdam University Medical Centers. We calculated long-COVID incidence proportions by migration background and assessed for clinical predictors via robust Poisson regressions. We then examined associations between migration background and long COVID using robust Poisson regressions and adjusted for derived clinical predictors, and other biologically relevant factors.

Results: 1886 patients were included. 483 patients had long-COVID (26%, 95% CI 24-28%) at 12 weeks post-discharge. Symptoms like dizziness, joint pain, and headache varied by migration background. Clinical predictors of long-COVID were female sex, hospital admission duration, intensive care unit admission, and receiving oxygen, or corticosteroid therapy. Long-COVID risk was higher among patients with migration background than Dutch origin patients after adjustments for derived clinical predictors, age, smoking, vaccination status, comorbidities and remdesivir treatment.

Conclusions: There are significant differences in occurrence, nature of symptoms, and duration of long-COVID by migration background. Studies assessing functional limitations and access to post-COVID healthcare are needed to help plan for appropriate and accessible healthcare interventions.

Abstract citation ID: ckae144.326

Risk of long COVID in migrants and the contribution of vaccinations, disease severity, social inequalities and preexisting health: A nationwide register study in Sweden

Agneta Cederstrom

A Cederstrom[1], *M Rostila*[1]
[1]Department of Public Health, University of Stockholm, Stockholm, Sweden
Contact: agneta.cederstrom@su.se

Background and aim: A number of studies have found higher COVID-19 infection rates, hospitalizations and deaths in migrants and ethnic minorities throughout the Corona Pandemic. Some recent evidence also suggests higher risk of long COVID in migrants although less is known about the risk factors for long COVID in this population. The objective of our study is to examine the risk of long COVID in migrants and to examine whether preexisting health conditions, disease severity, social inequalities and vaccinations contribute to the association.

Methods: We used linked Swedish administrative registers to estimate the risk of a long COVID diagnosis in the population that had a confirmed COVID-19 infection. Poisson regressions were used to calculate incidence rate ratios between the Swedish born and migrant groups. Adjustments for preexisting health conditions, disease severity, vaccinations and social inequalities were separately introduced.

Results: Higher risks of long COVID were found among migrants from Africa, Asia, Eastern Europe, Finland, Middle-East and South America. While the contribution of vaccinations and social inequalities were modest, we found that disease severity (i.e. whether the person was hospitalized or treated in an intensive care unit) primarily contributed to the higher risk of long COVID found in migrants.

Conclusions: The greater exposure and impact of the COVID-19 virus among migrants during the pandemic also affected the longer-term consequences of infection in this at-risk population.

5.P. Oral presentations: Understanding environmental, social and individual factors

Abstract citation ID: ckae144.327
Capturing the health and well-being impact of climate change: a health impact assessment in Wales

Liz Green

L Green[1,3], *N Edmonds*[2]
[1]Wales HIA Support Unit, Public Health Wales, Wrexham, UK
[2]Public Health Team, Swansea Bay University Health Board, Swansea, UK
[3]International Health, University of Maastricht, Maastricht, Netherlands
Contact: liz.green@wales.nhs.uk

Climate change is one of the biggest threats to global health in the 21st century and is likely to impact on health through a range of factors (societal, economic or environmental). The need to take action on climate and nature emergencies in order to protect population health and well-being and prevent negative impacts are becoming more urgent. Public Health Wales carried out a comprehensive mixed-method Health Impact Assessment (HIA) of climate change in Wales. HIA is a systematic process which considers the impact of a policy on the health and well-being of a population. It appraised the potential impacts of climate change on health and inequalities in Wales. This involved participatory workshops, engagement with stakeholders, statistical data, systematic literature reviews and case studies. The HIA findings indicate significant potential impacts across the determinants of health and mental well-being. For example, air quality, flooding, economic productivity, working conditions, access to services and community resilience. Impacts were identified across population groups, settings, and areas including urban and rural contexts, outdoor workers, children and young people, older people, schools, hospitals and workplaces. These findings have been beneficial to inform decision-makers to prepare for climate change plans and policies using a preventative evidence-informed approach. The work has demonstrated the value of HIA for significant, complex policies by mobilising a range of evidence through a transparent process, resulting in government and organizational action and transferrable learning for others.

Key messages:

- HIA is a beneficial tool to identify at a granular level the health impacts of climate change.
- The HIA has been used by the government of Wales and organisations to respond to and plan for climate change.

Abstract citation ID: ckae144.328
Cohort retention in a pandemic response study: Lessons from the SIREN study

Anna Howells

A Howells[1,2], *K Munro*[1], *A Kamal*[3], *J Haywood*[1], *E Aquino*[4], *S Russell*[1], *S Foulkes*[1], *J Islam*[1], *S Hopkins*[1], *V Hall*[1]
[1]UK Health Security Agency, London, UK
[2]Public Health Wales, Cardiff, UK
[3]School of Social Sciences, Birmingham City University, Birmingham, UK
[4]British Society for Immunology, London, UK
Contact: anna.howells@wales.nhs.uk

Background: Cohort studies represent an important research-tool, yet participant retention is difficult. SIREN followed a cohort of healthcare workers across 135 NHS sites in the UK during a pandemic. We designed an evolving retention programme, underpinned by our Participant Involvement Panel (PIP). We aimed to evaluate cohort retention over time and identify learnings.

Methods: Mixed method evaluation of our evolving retention programme in the 12 and 24-month cohort. We described cohort retention by demographics and site, using odds ratios from logistic regression. Withdrawal reasons were collected by survey. We collected participant feedback via cross-sectional survey using a behavioural science approach. We conducted focus groups with research teams and conducted thematic analysis.

Results: 37,275 (84.7%) participants at 135 sites completed 12-months of follow-up. 12,635 (85.5%) participants at 87 sites completed 24-months. Retention increased with age (24-months: >65 vs < 25 years OR $= 2.92$; 95%CI: 1.78-4.88; $p < 0.001$) and was highest in the Asian and Black ethnic groups (24-months OR $= 1.78$; 95%CI: 1.42-2.25; $p < 0.001$, and OR $= 2.12$; 95%CI: 1.41-3.35; $p < 0.001$, respectively, Ref=white). SIREN scored highly in participant feedback. Lessons for future studies include the need to monitor changing participant motivation; using inclusive and comprehensive communication; acknowledging the contributions of participants and investing in the skillset of research teams.

Conclusions: Despite challenges to running a large multicentre cohort study in an evolving pandemic, retention in SIREN has remained very high. Some factors impacting retention were outside of study control, including the altruistic motivation of participants. Participant feedback was positive, suggesting SIREN methodology will provide useful learning for future retention programmes. Site feedback provided learning for future multicentre research studies, offering insights into key facilitators and common challenges.

Key messages:

- Cohort retention is difficult. Mixed methods evaluation shows SIREN achieved high retention while following a cohort of healthcare workers across 135 NHS sites in four UK nations during a pandemic.
- Lessons learned include the need to monitor changing participant motivation; using inclusive communication; acknowledging participants contributions and investing in the research team skillset.

Contact: sarah.nayani@sciensano.be

Tobacco use remains a challenge given its substantial role in contributing to disability and premature death globally. Understanding its impact on population health, as an attributable burden, can help monitor progress on the effectiveness of tobacco policies. In this study, we used the Comparative Risk Assessment (CRA) method to estimate the share of the disease burden due to smoking in Belgium from 2013 to 2020. Population attributable fractions (PAF) were computed for risk-outcome pairs by age, sex, and region in Belgium for 2013-2020. Exposure estimates were extracted from a time series of the Belgian Health Interview Survey. Dose-response curves or relative risk estimates were drawn from the Global Burden of Disease Study 2019. In Belgium, smoking-related deaths decreased from 12,851 deaths (PAF=11%) in 2013 to 9,413 deaths (PAF=7%) in 2020. Deaths among men (2013: PAF=18%, $n = 9859$; 2020: PAF=11%, $n = 7041$) were three times higher than among women (2013: PAF=5%, $n = 2991$; 2020: PAF=3%, $n = 2341$).

Over time, larynx cancer (2013: PAF=72%, n = 185; 2020: PAF=63%, n = 125), trachea, bronchus, and lung cancer (2013: PAF=60%, n = 4,899; 2020: PAF=60%, n = 3,682), other pharyngeal and oropharyngeal cancers (2013: PAF=47%, n = 118; 2020: PAF=40%, n = 100), mouth cancer (2013: PAF=37%, n = 172; 2020: PAF=30%, n = 122), and aortic aneurysm (2013: PAF=40%, n = 268; 2020: PAF=33%, n = 209) emerged as the primary contributors to smoking-related deaths in Belgium. While the ranking of contributing causes stayed mostly consistent in both genders over the years, cervical cancer (2013: PAF=23%, n = 53; 2020: PAF=21%, n = 64) ranked fourth instead of mouth cancer (2013: PAF=22%, n = 28; 2020: PAF=14%, n = 15) among women. Despite decreasing trends over time, smoking remains a significant contributor to cancer deaths in Belgium, particularly among men. Results from this study can help inform the development of strategies for smoking prevention and reinforce the need for continued efforts in prevention initiatives.

Key messages:

- Cancers are the primary cause of smoking-related deaths in Belgium, with a decline in the death toll over time.
- Understanding the role of smoking on population health as an attributable burden can improve health monitoring.

Abstract citation ID: ckae144.330
Metabolic syndrome prevalence has increased in Finland from 2000 to 2023

Tuija Jääskeläinen

L Lehtoranta[1], T Jääskeläinen[1], T Palosaari[1], S Männistö[1], K Sääksjärvi[1], J Lahti[1], A Lundqvist[1]
[1]Public Health, THL, Helsinki, Finland
Contact: tuija.jaaskelainen@thl.fi

Obesity presents a metabolic burden that leads to increased non-communicable disease (NCD) morbidity with metabolic syndrome (MS) as a pathway. The aim was to examine the trends in the obesity and MS prevalences. The study included health examination survey data collected in 2000 and 2023 (n = 7 258, 20-64 years). Examination measurements, blood samples, questionnaires, and register data were collected. MS criteria (ATPIII/AHA) included at least 3 of the following: increased waist circumference, elevated fasting glucose or medication, elevated triglyceride or medication, elevated blood pressure (BP) or medication, and decreased HDL-cholesterol or medication. Participants were divided according to BMI (normal weight 18.5-24.9 kg/m2, overweight 25.0-29.9 kg/m2, obesity 30.0-34.9 kg/m2, severe obesity = >35.0 kg/m2). Weighted prevalence and 95% confidence intervals (CIs) of MS and obesity were calculated considering sampling design and non-response. Prevalences of normal weight decreased from 2000 (men 32%, 95% CI 30-35; women 45%, 95% CI 43-47) to 2023 (men 26%, 95% CI 23-28; women 34%, 95% CI 32-37) and obesity increased from 2020 (men 17%, 95% CI 15-18; women 15%, 95% CI 14-17) to 2023 (men 20%, 95% CI 18-22; women 18%, 95% CI 16-20) as did severe obesity (in 2000: men 4%, 95% CI 3-5; 6%, 95% CI 5-7 - in 2023 men10%, 95% CI 8-12; women 13%; 95% CI 11-14). The prevalence of MS increased from 37% (95% CI 34-39) to 45% (95% CI 43-48) in men and 30% (95% CI 28-32) to 37% (95% CI 34-39) in women. The prevalence of MS with obesity varied from 2000 to 2023 from 73-77% in men and 69-61% in women and with severe obesity from 88-91% in men and 79-76% in women. From 2000 to 2023, no MS components remained stable with normal weight (men 29-25%, women 44%) and obesity (both sexes <1%). The prevalence of MS has increased in the last 20 years. Obesity is a major risk factor for MS that increases the future burden MS and, consequently, of NCD on societies.

Key messages:

- Metabolic syndrome has increased in Finland from 2000 to 2023. At the same time, the prevalence of those with normal weight has decreased and severe obesity increased.
- The global obesity pandemic will further increase the burden of NCD's in the future. This is already visible with increasing metabolic syndrome prevalence.

Impact of temperature and humidity on airway obstruction in a cohort of elderly women

Ashtyn Areal

A Areal[1,2], N Singh[1], T Schikowski[1]
[1]Epidemiology, IUF-Leibniz Research Institute for Environmental Medicine, Dusseldorf, Germany
[2]Medical Research School, Heinrich-Heine-University, Dusseldorf, Germany
Contact: ashtyntracey.areal@iuf-duesseldorf.de

Background: Temperature and relative humidity (RH) impact human health. However, little is known about the combined association between temperature and RH on respiratory health in the elderly. In this study, we evaluated the interactive associations of temperature and RH on airway obstruction in elderly German women.

Methods: Using data from the second follow-up (2007-2010) of the German SALIA cohort study, we assessed the short-term (Lag0-8) combined association between maximum and minimum temperature (Tmax, Tmin) and RH on airway obstruction. Airway obstruction was defined as the ratio of first second of forced expiration (FEV1) / forced vital capacity (FVC) < 0.70. Multivariable logistic regression with a distributed lag non-linear model (DLNM) was constructed for the interaction between temperature and RH and adjusted for a single pollutant, location, socioeconomic status and smoking status.

Results: 735 elderly women with an average (±SD) age of 73.46 (± 3.09) years were included. Around 16.73% of them had airway obstruction. For non-linear antagonistic Tmax and RH interaction models, we found a U-shaped relationship from Lag 0-8, with an immediate adverse association from Lag0-1 and a significant delayed adverse association from Lag7-8. For non-linear antagonistic Tmin and RH interaction models, the relationship was U-shaped and showed an immediate adverse association from Lag0-1, while there was also a significant delayed association from Lag6-8.

Conclusions: Climate change increases the likelihood of exposure to adverse temperatures and weather conditions. Vulnerable populations like the elderly are more susceptible to the adverse associations of climate change. In this epidemiological study, we found that exposure to Tmax/Tmin and RH had immediate and delayed adverse associations by increasing respiratory obstruction in elderly women. Increasing public awareness of the danger of interactions between non-optimum temperature and RH on respiratory health is crucial.

Key messages:

- Elderly women's respiratory health is impacted by temperature and humidity interactions, requiring awareness and proactive measures.
- Climate change heightens risk for vulnerable groups, emphasising the need to address environmental impacts on health.

5.Q. Oral presentations: Capacity building and career development

Abstract citation ID: ckae144.332

Creating good career prospects for professionals in the infectious disease control in the Netherlands

Neelke Krijgsman

M Hop-Boxhoorn[1], *N Krijgsman*[1], *A de Munter*[1], *M Linthorst*[1]
[1]Department of Health Care, GGD GHOR Nederland, Utrecht, Netherlands
Contact: nkrijgsman@ggdghor.nl

Background: A strong public health system in the Netherlands requires sufficient and motivated professionals. In preparation for new large outbreaks and pandemics, a strong workforce is essential. Providing good career prospects is crucial to attract, engage and retain professionals at the 25 Dutch Regional Public Health Services (RPHSs). However, it is unclear what opportunities and barriers professionals experience concerning their career prospects in the infectious disease control.

Methods: We aimed to identify these barriers and opportunities using focus groups with infectious disease medical doctors, nurses and assistants. Tangible solutions to address barriers and strengthen facilitating factors were gathered using in-depth interviews with key figures within the board, management, training coordinators and human resources of the RPHSs.

Results: Forty-six professionals participated in six focus groups. Barriers and opportunities for good career prospects included whether or not professionals experienced: personal development opportunities, achievement appreciation, and opportunities for (financial) growth. Interviews with key figures identified solutions to career prospect barriers, which were grouped into five themes: 1) Engage in conversations about career prospects, 2) Provide sufficient achievement appreciation, 3) Ensure connectivity between RPHSs, 4) Develop a perspective on career prospects, 5) Improve the image of RPHSs.

Recommendations: A guideline was developed for RPHSs to improve the career prospects of infectious disease control professionals including 17 recommendations. Implementation of these recommendations will contribute to the attractiveness of working in the public healthcare.

Key messages:

- Addressing barriers and encouraging opportunities for good career prospects is essential to captivate, engage and retain public health professionals for pandemic preparedness.
- Career prospects can be improved by developing and communicating a perspective on career prospects, increasing appreciation of achievements, and improving the image of working in public health.

Abstract citation ID: ckae144.333

Wellbeing, career satisfaction, and educational requirements in healthcare assistants in Ireland

Parnian Jalili

P Jalili[1], *KF Conyard*[1], *P Wall*[1], *E Gormley*[1], *MB Codd*[1]
[1]School of Public Health, UCD, Dublin, Ireland
Contact: parnian.jalili@ucdconnect.ie

Background: The long-term residential care (LTRC) sector in Ireland relies heavily on Health Care Assistants and Carers (HCAs). This workforce has become increasingly diverse in recent years, often relying on non-national temporary workers with varying levels of education. In 2022, of 22,495 HCAs and 5,289 Healthcare Support Assistants working in 563 nursing homes caring for some 30,000 residents, 22% were non-national. Their plight became evident during COVID-19 which had profound consequences in the LTRC sector.

Objectives: In this study, we investigate the recruitment, training, employment terms and conditions of HCAs in Ireland, as well as their general well-being and career satisfaction.

Methods: A cross-sectional study of members of ‘Care Assistance Ireland’, for which ethics approval was granted for an estimated sample of 1,052, is conducted. Validated instruments used are: the Maastricht Instrument for Sustainable Employability (MAISE); Utrecht Work Engagement Scale (UWES); General Wellbeing Schedule (GWBS) and Minnesota Career Satisfaction Survey (MCSS).

Results: The internal consistency reliability (Cronbach’s alpha) of GWBS and MCSS instruments were high. The response rate in the selected sample is estimated circa 60%, the majority being female and qualified. General well-being status will be investigated once all responses are submitted. Spearman correlation is predicated to show moderate to strong positive correlations (0.2-0.9) for all GWBS and MCSS questionnaires questions. While MAISE and UWES are still under investigation. It is predicted that there is variability in the requirements for, and terms and conditions of, employment among HCAs in Ireland, while job security remains a concern.

Conclusions: These findings reinforce the importance of ensuring standards for recruitment, training, job security and well-being for the LRTC workforce. The lack of educational requirements for HCAs in some settings is a critical consideration.

Key messages:

- Findings will impel a more agreeable, consistent entry award in the healthcare system.
- It profiles career needs of HCAs outlining the long-term shortfalls preventable with health policy enactments.

Abstract citation ID: ckae144.334

Methods for projecting health workforce planning in Ireland: a collaborative approach

Charlotte Myers

C Myers[1], *V Segerstrom*[1], *A McDonnell*[1], *A De Vore-Merriman*[1], *B Johnston*[1]
[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
Contact: myersch@tcd.ie

Background: Health workforce planning (HWFP) is the process of analysing, forecasting, and planning workforce supply and demand, assessing gaps, and determining target workforce to ensure that health systems are prepared for future demand. HWFP elicits recommendations that are ideally utilised by the health system to support medical workforce over a defined time.

Methods: The objective of this project is to inform intake for medical and surgical specialties in Ireland to reach the necessary consultant workforce by 2038. A literature search was conducted to help inform the methodology for this project. The most common approach was a needs-based model, and additional reviews discussed the integration of medical engagement into the modelling approach.

Results: This project will employ a collaborative approach, combining mathematical modelling and a combination of quantitative and qualitative inputs, including the following phases: 1. The research phase will estimate baseline supply and demand data across medical and surgical specialties in Ireland using statistical models; 2. The presentation phase will include input from clinical leads to allow for more accurate assumptions in the baseline of each model; 3. Review of projections will include feedback from the clinical leads to help clarify and improve the initial model; 4. Presentation of the revised projection will include further collaboration with clinical leads to finalise the model.

Conclusions: The robust methodology for this HWFP project will ideally inform medical and surgical specialities in Ireland through 2038. Specific and extensive predictions of health workforce supply and demand will enhance strategic preparation, which is a key priority for the Health Service Executive in Ireland.

Key messages:
- A collaborative approach to HWFP is essential for health service preparation and improvement.
- The project will be finalised by the end of 2024, and the methodology for conducting similar HWFP projects can be adapted by other EU states.

Abstract citation ID: ckae144.335

Decision support systems as supporters of clinical work: perspectives from physicians in Finland

Tarja Heponiemi

T Heponiemi[1], *T Lääveri*[2,3], *J Kaipio*[2], *E Kainiemi*[1], *L Virtanen*[1], *A Kaihlanen*[1]
[1]THL, Helsinki, Finland
[2]Department of Computer Science, Aalto University, Espoo, Finland
[3]Inflammation Center, Helsinki University Hospital and University of Helsinki, Helsinki, Finland
Contact: tarja.heponiemi@thl.fi

Background: The digitalisation of healthcare has changed physicians' clinical and administrative work. For example, decision support systems (DSSs) are expected to support physicians' daily work. The present study examined physicians' experiences of DSSs' support for their work analysed by age, gender, employment sector and leadership position.

Methods: Altogether 4630 physicians (64% women) from Finland responded to the online survey. Logistic regression analyses were conducted to examine the associations of age, gender, employment sector, and leadership position with experiences of DSSs' support for their work.

Results: Of the respondents, 21.3 % agreed that DSSs supported their work, whereas 43.5 % were neutral and 35.2 % disagreed with the statement. Age (Wald's $F = 15.5$, $p = 0.001$), employment sector (Wald's $F = 84.6$, $p < 0.001$), and leadership position (Wald's $F = 16.3$, $p < 0.001$) were significantly associated with the assesment, whereas gender was not. Those aged between 45 and 54 (OR 0.65, 95% CI 0.51-0.81) and between 55 and 64 (OR 0.74, 95% CI 0.59-0.93) had lower odds for agreeing compared to those aged 35 or under. Compared to physicians in hospitals, primary care physicians had 2.18 times (95%CI=1.84-2.59) greater odds for agreeing that DSSs support their work. Those who were in leadership positions had 1.50 times (95%CI=1.23-1.82) greater odds for agreeing compared to those not in leadership positions.

Conclusions: Finnish physicians did not experience DSSs supporting their work. Especially older physicians, hospital physicians and those not in leadership positions gave negative assessments. DSSs should be better integrated to physician workflow, it is also possible that usability problems of DSSs such as alert fatigue affected user experiences. More attention should be paid to developing DSSs in a way that they support physicians work better.

Key messages:
- Finnish physicians did not experience that decision support systems would actually support their work.
- Especially older physicians, hospital physicians and those not in leadership positions did not agree that decision support systems would support their work.

Abstract citation ID: ckae144.336

Healthcare professionals and students' knowledge on termination of pregnancy: A systematic review

Sara Leitao

E O'Shaughnessy[2], *I San Lazaro Campillo*[1], *K O'Donoghue*[2,3], *S Leitao*[1,2]
[1]Department of Obstetrics and Gynaecology, National Perinatal Epidemiology Centre, Cork, Ireland
[2]Department of Obstetrics and Gynaecology, Pregnancy Loss Research Group, Cork, Ireland
[3]University College Cork, INFANT Research Centre, Cork, Ireland
Contact: s.leitao@ucc.ie

Background: Providing safe termination of pregnancy (TOP) according to each country's legalisation is an important public health matter internationally. Healthcare professionals (HCPs) and healthcare students have key roles and need to be aware of legislation and clinical practice guidelines on TOP in their country to facilitate safe and effective care. The main aim of this systematic review was to investigate the level of knowledge on TOP legislation among HCPs and healthcare students. The second objective was to assess the knowledge of TOP methods, procedures and/or potential associated complications.

Methods: This is a systematic review of qualitative and quantitative peer-reviewed studies published in English or Portuguese until July 2020. Databases included in the search were EBSCO, PubMed, Embase and Scopus. The quality appraisal was done using the CASP Critical Appraisal tools.

Results: A total of 31 studies were included, published between 2002 and 2020 and from several regions around the globe. No studies were carried out in Europe or the United Kingdom. A total of 22 studies included healthcare professionals and nine studies included students. Overall, all the studies showed poor knowledge of TOP legislation and TOP methods, procedures and complications. Knowledge of special circumstances established in the law where TOP might be legal was also very limited. In studies focussing on medical (MA) and surgical (SA) TOP, knowledge of MA was lower than of SA. Studies reported that practitioners and students have limited training in TOP. Overall, education/training and experience with TOP seem to be the main factors associated with increased levels of knowledge. Similar results were found for student's knowledge.

Conclusions: This study highlighted the importance of involving and promoting the participation of HCPs and students in the provision of TOP services. A clear need and desire for staff education and training on TOP was shown.

Key messages:
- TOP training is limited and broadly excluded from medical and healthcare education globally. Students and staff have recognised this issue and the critical impact it has on TOP care provided.
- Adequate knowledge and training in TOP ensures service sustainability and preparation of current and future healthcare practitioners to provide high-quality, respectful and compassionate care.

6.A. Round table: Building a Public Health Innovation Ecosystem in the WHO European Region

Abstract citation ID: ckae144.337

Organised by: WHO/Europe, EUPHA
Chair persons: Iveta Nagyova (EUPHA), Moredreck Chibi (Denmark)
Contact: ivanagy@gmail.com

Background: In the WHO European region, challenges persist in bridging the gap between innovative health solutions and their widespread implementation at a population scale. Despite advancements in AI, digital systems, precision medicine, genomics, and social innovations, these potential solutions often go underutilized. Immediate action is necessary to address the multifaceted issues faced by health systems, such as aging populations, noncommunicable diseases, antimicrobial resistance, and climate change impacts on health. To effectively tackle these challenges, it is essential to develop and implement innovations that respond to critical health issues in a contextual manner. Establishing an innovation ecosystem that fosters collaboration, strategic partnerships, and effective scaling of innovative solutions is crucial. Robust policy frameworks and governance mechanisms are needed to engage with the private sector and other nontraditional public health partners to drive equitable and value-driven innovations in public health.

Rationale: The workshop at the 17th European Public Health Conference 2024 aims to explore the role of public-private collaborations in driving innovative solutions for public health. By examining synergies between sectors, the workshop seeks to accelerate innovation, improve preventive services, and enhance health delivery to address pressing public health challenges. Leveraging the private sector's expertise and resources is crucial in addressing complex health issues and improving public health outcomes. The workshop will provide a platform to strategize on utilizing these collaborations for sustainable innovation in public health.

Overall Objective: Foster a deeper understanding of the benefits and challenges of public-private collaborations in advancing public health innovation.

Specific Objectives:

- Facilitate knowledge exchange on successful collaboration models between the private sector and public health entities.
- Identify key strategies to utilize private sector resources for innovative public health solutions.

Outcomes:

- Inspire the formation of new partnerships to drive innovation in public health.
- Develop actionable insights to enhance collaboration between the private sector and public health stakeholders for sustainable innovation.

Workshop Structure: The workshop will begin with a Scene-setting presentation of Dr Gauden Galea, Strategic Advisor to the Regional Director, WHO Europe, on WHO Europe's approach to leveraging innovation for public health outcomes (10 mins). Panelists will then discuss concrete examples of public-private collaboration leading to improvements in public health outcomes (40 mins). Key success factors for meaningful partnerships with the private sector will be explored, emphasizing policy considerations and the importance of behavioral and cultural insights in innovation. Interactive Q&A session with audience will close the meeting (10 mins).

Key messages:

- Establishing an innovation ecosystem fosters partnerships that drive equitable and sustainable solutions in public health.
- Public-private collaborations accelerate innovation for public health, vital for addressing complex challenges effectively.

Speakers/Panelists:

Götz Gottschalk,
YouTube, Berlin, Germany

Götz Gottschalk (Head of Health, YouTube Germany) will discuss the role of technology, particularly YouTube, in disseminating accurate health information to the public. He will also share insights on how digital platforms can be utilized to promote public health initiatives, address misinformation, and engage with diverse audiences effectively. His talk will also focus on the importance of collaboration between the public and private sectors in leveraging technology for public health outcomes, emphasizing the need for responsible and accurate health communication in the digital age.

Phillippe Menu
SOPHiA Genetics, Rolle, Switzerland

Phillippe Menu (Chief Medical Officer and Chief Product Officer, SOPHiA Genetics, Switzerland) will discuss how data-driven approaches, artificial intelligence, and genomic insights can revolutionize diagnostics, treatment decisions, and personalized medicine. His talk will highlight the potential of integrating advanced technologies into public health to improve patient outcomes, enhance clinical decision-making, and drive innovation in the field of precision medicine.

Els Torreele
Institute for Innovation and Public Purpose, University College London, London, UK

Els Torreele (Policy Associate, UCL Institute for Innovation and Public Purpose) will discuss policy frameworks, governance structures, and strategies to promote equitable access to public health innovations, particularly in low- and middle-income countries. Her talk will shed light on the intersection of innovation, public policy, and global health, emphasizing the importance of addressing systemic barriers to ensure that innovative healthcare solutions reach those who need them the most.

Andrew Nerlinger
Global Security Fund, Geneva, Switzerland

Andrew Nerlinger (Executive Director, Global Security Fund) will discuss pandemic preparedness, biosecurity measures, and the role of non-profit organizations in addressing global health threats. His talk will explore how innovative approaches, partnerships, and funding mechanisms can strengthen global health security, mitigate risks, and build resilience in the face of emerging health crises.

Susan Michie
Centre for Behaviour Change, University College London, London, UK

Susan Michie (Professor of Health Psychology and Director of the UCL Centre for Behaviour Change) will discuss evidence-based strategies for promoting behavior change, improving health outcomes, and addressing public health challenges through behavioural and cultural insights. Her talk is expected to highlight the importance of understanding human behavior, motivations, and decision-making processes in designing effective health interventions and shaping public health policies.

6.B. Oral presentations: Digital health in practice

Envisioning telemedicine in the EU health systems: Insights from policy experts and cancer patients

Tugce Schmitt

T Schmitt[1], *K Habimana*[2], *A Gottlob*[2], *C Habl*[2], *C Plomariti*[3], *A Farmaki*[4], *P Bogiatzidis*[5], *V Leclercq*[1], *M Delnord*[1], *M Van den Bulcke*[1]
[1]Cancer Centre, Sciensano, Brussels, Belgium
[2]IPED, Austrian National Public Health Institute, Vienna, Austria
[3]Lab of Medical Physics and Digital Innovation, Aristotle University of Thessaloniki, Thessaloniki, Greece
[4]Institute of Applied Biosciences, Centre for Research and Technology Hellas, Thessaloniki, Greece
[5]3rd Regional Health Authority, Thessaloniki, Greece
Contact: Tugce.Schmitt@sciensano.be

Background: Conducted as part of WP4 (Sustainability) of the eCAN Joint Action, the aim of this foresight exercise was to understand how telemedicine services in EU-Member States (MS) could be implemented in a patient-centric way to tackle cancer.
Methods: Based on a literature review, we identified factors that impact on the implementation of telemedicine in EU MS; these were integrated to an online survey. Health policy experts were invited to rank 34 factors using a 7-point Likert scale to better understand the barriers and facilitators of telemedicine services at the health system level, whilst patient associations ranked 28 other factors to capture end-users' view. Next, survey respondents were invited to a foresight workshop to collect qualitative data and gain a forward-looking perspective.
Results: 20 health policy experts working in digital health across 14 EU MS, predominantly from Ministries of Health, and 8 cancer patient associations from 5 EU MS responded to the surveys. For a sustainable integration of telemedicine services in the EU, policy experts recommend developing a clear legal framework, embracing a hybrid healthcare model, and enhancing digital literacy. They stress the importance of telemedicine as a complementary tool, advocating for solid IT infrastructure, privacy safeguards, and the integration of health equity. Similarly, cancer patients emphasise the importance of being able to choose between telemedicine and in-person visits, focusing on personal interaction. They advocate for the involvement of patients in the design and testing of telemedicine services, ensuring solutions meet their preferences.
Conclusions: Policy experts and patients are in favour of hybrid models for cancer care. Recommended public health actions include: i) develop legal frameworks to complement in-person care with telemedicine; ii) boost digital literacy and IT infrastructure, ensuring privacy and health equity; and iii) involve patients in design for tailored services.
Key messages:

- Both the EU Member States and cancer patients view telemedicine as a useful and complementary tool, however, not as a replacement for in-person healthcare services.
- Both the EU Member States and cancer patients champion telemedicine with a focus on equity, privacy, digital literacy and a hybrid model of care that respects patient preferences for cancer treatment.

Abstract citation ID: ckae144.339
Machine-learning based prediction for high health care utilizers using a multi-institution registry

Joshua Kuan Tan

JK Tan[1], *L Quan*[2], *NNM Salim*[1], *JH Tan*[2], *SY Goh*[3], *J Thumboo*[1], *YM Bee*[3]
[1]Health Services Research Unit, Singapore General Hospital, Singapore, Singapore
[2]Data Science and Artificial Intelligence Lab, Singapore General Hospital, Singapore, Singapore
[3]Department of Endocrinology, Singapore General Hospital, Singapore, Singapore
Contact: joshuatankuan18@gmail.com

Background: Rising healthcare costs worldwide have spurred interest in using machine learning to pinpoint major healthcare utilizers for population health efforts. Previous studies have focused on individuals who impose the highest financial burden, such as targeting high-need high-cost utilizers, a small group with limited potential for cost reduction. Therefore, we developed models to predict future healthcare utilization across various thresholds.
Methods: We leveraged data from a multi-institutional diabetes database to develop binary classification models capable of predicting healthcare utilization in the following year. The models predicted six different outcomes: patients with an annual total length of stay of ≥ 7, ≥ 14, and ≥ 30 days, and emergency department (ED) attendance of ≥ 3, ≥ 5, and ≥ 10 visits. To mitigate class imbalance, we applied random and synthetic minority oversampling techniques and compared against models trained without oversampling. Models were trained with 2019 data and tested on unseen data from 2020 and 2021.
Results: Models trained with random oversampling, including logistic regression, multivariate adaptive regression splines, boosted trees, and multilayer perceptron, consistently demonstrated high AUC (>0.80) and sensitivity (>0.60) across both training-validation and test datasets. Addressing class imbalance was found to be crucial, as models without oversampling displayed satisfactory AUC (>0.80) but significantly lower sensitivity (<0.10). Key predictors identified included age, number of ED visits in the present year, chronic kidney disease stage, in-patient bed days in the present year, and mean HbA1c levels.
Conclusions: Our machine learning models successfully predict high service level utilization with strong performance, offering valuable tools for policymakers and health planners to develop targeted health initiatives based on patient utilization patterns.
Key messages:

- Machine learning models can be leveraged to predict future healthcare utilization and facilitate interventional program development.
- Annual total length of stay and total emergency department visits are useful service level indicators.

Abstract citation ID: ckae144.340
A CDSS based Integrated Pathway for Influenza Vaccination Across Primary and Secondary Care

Maria Lucia Specchia

ML Specchia[1,2], *F Beccia*[1], *MG Cacciuttolo*[1], *D Tona*[1], *M Di Pumpo*[1], *M Porcelli*[1], *A Lontano*[1], *VF Corona*[1], *S Boccia*[1,2], *R Pastorino*[1,2]
[1]Department of Life Sciences and Public Health, Catholic University of the Sacred Heart, Rome, Italy
[2]Hospital Foundation A. Gemelli IRCCS, Rome, Italy
Contact: marialucia.specchia@unicatt.it

Background: In Italy, influenza vaccination coverage in people ≥ 65 years is unsatisfactory (56.7%), underlining the need to improve current vaccination strategies. The objectives of this study have been: to define a novel pathway to increase influenza vaccination adherence among ≥ 65 years population in the Lazio region; to provide a predictive estimate of the epidemiological and economic pathway's potential impact.
Methods: A multidisciplinary working group (WG) featuring cross-sectoral expertise was created and WG periodic meetings were held to define the patient journey and its flow-chart representation. The pathway's potential impact was assessed through epidemiological and economic indicators and scenario analyses.

Results: An integrated pathway across primary and secondary care was defined, based on the active patient in-Hospital recruitment and vaccination and enhanced by a Clinical Decision Support System relying on a digital algorithm to identify eligible patients. Assuming an increase of influenza vaccination coverage from the current rate of 60% (scenario 1) to 65% (scenario 2) in ≥ 65 years population in the Lazio region thanks to the pathway implementation, an increase of 8% in avoided influenza cases, influenza- or pneumonia-related hospitalizations and influenza-related outpatient visits was estimated with a relative increase in savings for hospitalizations and outpatients visits of up 2,367,310 euros. Setting the vaccination coverage at 70% (scenario 3), an increase of 16% in avoided influenza cases, hospitalizations and outpatient visits was estimated with a relative increase in savings for hospitalizations and outpatients' visits of up to 4,833,259 euros.

Conclusions: Alongside offering a predictive estimate of the relevant pathway's potential impact, both epidemiological and economic, this project, with its robust methodology, may serve as a scalable and transferable model for enhancing vaccination coverage at national and international level.

Key messages:

- The proposed pathway, offering the option of receiving flu vaccination within the Hospital, supports the paradigm shift towards primary prevention pathways in secondary care settings.
- Another relevant aspect of the integrated pathway is the adoption of an Artificial Intelligence tool to identify suitable patients and improve their recruitment and adherence to vaccination.

Abstract citation ID: ckae144.341
Machine Learning techniques for predicting inpatient probability and LOS from EU Injury Database

Alessio Pitidis

A Pitidis[1]*, G Fondi*[2]*, A Carannante*[2]*, M Giustini*[2]
[1]Research & Development, B2C Innovation Inc., Milan, Italy
[2]Environment and Social Epidemiology, Italian National Institute of Health, Rome, Italy
Contact: alessiop.dati@gmail.com

Background: Unlike statistical inference Machine Learning (ML) makes repeatable predictions without prior assumptions about the underlying relationships among variables. The Full Data Set (FDS) of the EU-IDB (European Injury DataBase) consent to explore risk of hospitalization due to injuries using many predictors. The Length Of Stay of patients in hospital (LOS) is a relevant proxy of complexity of treatment and resources consumption.

Methods: The IDB-FDS provides more than 3.800.000 ED records, in years 2008-19 for 19 Countries. LASSO (Least Absolute Shrinkage and Selection Operator) cross-validated linearized regression technique (linear for LOS) was used for variable selection and parameter regularization. Inpatients are those admitted or transferred to hospital. Days of hospitalization were used for LOS. A cross-validated Generalized Linear Model was performed on 5 folds randomly sampled assigning 80% of records to training and 20% to testing samples.

Results: The strongest predictors of hospital admission risk, selected by the model were in order of importance: EUROCOST-39 diagnoses categories, Age Group, Intent, Mechanism Of Injury, Activity When Injured, Transport Injury Event, Sex Of Patient, Place Of Occurrence. EUROCOST-39 represents 61,9% of explained variability and age group 19,4%. The strongest predictors of LOS were substantially the same: EUROCOST-39 86,2% of explained variability and age group 8,6%.

Conclusions: The main part of variability in the ML model is explained by diagnoses reclassified according to a disability standardization method. For instance, in the maximum training sample risk of hospitalization ranges from odd 0,76% for hand/fingers sprain up to 154,02% for brain concussion. In the median sample LOS ranges from 0,45 days for strain of hand/fingers up to 11,65 for multi-trauma. A combination of more disabling injury, older age and mechanism of injury (i.e. threat to breathing) increases enormously the risk of hospitalization and LOS.

Key messages:

- Machine Learning techniques applied on EU-IDB can provide identification of relevant risk factors of hospital admission from injuries for targeting preventive measures and organizing health care.
- Artificial Intelligence consents to analyse big amount of data as dimension or analytical detail of information for identifying patterns and predictors of specific indicators for injuries or diseases.

Abstract citation ID: ckae144.342
Predictive machine learning algorithms for metabolic syndrome among Tunisian adults

Mariem Zribi

[6]JEAI_TANIT, Tunis, Tunisia
Contact: zribi.mariem.fmt@gmail.com

Background: Metabolic syndrome (MS), a cluster of interconnected risk factors for cardiovascular disease and type 2 diabetes, poses a significant health burden globally. In Tunisia, amidst an ongoing epidemiological transition, the prevalence of MS presents a growing concern. Our study aimed to identify the potential risk factors of MS and propose better machine learning (ML) based models for predicting MS among Tunisian adults.

Methods: Data was sourced from the Tunisian Health Examination Survey THES-2016, encompassing individuals aged 20 years and older. MS was defined based on the criteria set by the International Diabetes Federation. Logistic regression (LR) was employed to determine risk factors for MS. Adjusted odds ratios (aOR) and 95% confidence intervals (CI) were calculated. Five ML algorithms (Naïve Bayes, Support Vector Machine (SVM), Artificial Neural Network (ANN), AdaBoost, and Random Forest (RF)) were utilized to predict MS. Performance evaluation was conducted using accuracy, precision, recall, and area under the curve (AUC) metrics.

Results: Among the 8908 participants, the prevalence of MS was 32.8% (95% CI: 31.4% - 34.6%). LR identified age group 60-69 years (aOR: 18.5, 95% CI: 16.9-19.9, $p < 0.001$), female sex (aOR: 1.7, 95% CI: 1.2-1.9), sedentariness (aOR: 1.6, 95% CI: 1.5-1.8) and low education level (aOR: 1.2, 95% CI: 1.1-1.4) as significant factors associated with MS. Among ML models tested, AdaBoost had the highest accuracy (89.8%), followed by SVM (89.6%). Naïve Bayes had the highest Recall (98.1%) and the most performant AUC (91.4%), while RF had the highest Precision (70.8%). The ANN had an accuracy of 89%, a precision of 70.4%, a recall of 78.7% and an AUC of 85.1%.

Conclusions: Our study highlighted the effectiveness of ML algorithms like AdaBoost and SVM in predicting MS among Tunisian adults, offering potential as early detection tools. However, further validation with larger datasets is necessary to solidify their utility in healthcare settings.

Key messages:

- Metabolic syndrome, a complex of cardiovascular risk factors, presents a substantial global public health challenge and is particularly pronounced in Tunisia.
- Machine learning algorithms, notably AdaBoost and Support Vector Machine, demonstrate promise in forecasting and addressing metabolic syndrome.in Tunisian adults.

Development of the Unbiased Disease Network Using Health Insurance Claims Big Data in South Korea

Kyungmin Lee

KM Lee[1], *JW Nam*[1], *KB Yoo*[2]
[1]Department of Health Administration, Yonsei University, Wonju, Gangwon-do, South Korea
[2]Division of Health Administration, Yonsei University, Wonju, Gangwon-do, South Korea
Contact: kmlee97@yonsei.ac.kr

Background: Research on the overall relationship between disease is needed. The disease network model can comprehensively show the complex relationships between diseases and progression patterns. Existing disease network studies were estimated by univariate relative risks. We aim to develop the unbiased disease network.

Methods: We used NHIS national data of 50 million patients, collected from 2008 to 2022. We used only the primary diagnosis codes (three-digit codes) and defined 603 disease categories based on the special tabulation list for morbidity in the detailed subcategories of ICD-10, prior research, and the frequency of diseases in the dataset. To develop a more unbiased disease network, we first adjusted for age, sex, period, season, and encounter type, then added the confounding disease exposure according to the Directed Acyclic Graph (DAG) and performed Poisson regression to estimate relative risk (RR) applying Inverse Probability Weighting (IPW). We identified statistically significant disease pairs ($RR > 1.10$, $p < 0.001$) and repeated the IPW analysis up to the third round because the network would be updated every round. The significant disease pairs identified in the last round were connected to develop the overall network and subnetworks by age and sex.

Results: We repeated the process up to the third round for all 346,948 disease pairs and fitted 9,024 pairs as significant. We identified general population disease network and subnetwork per age and sex subgroups.

Conclusions: These disease networks represented the overall progression relationship between diagnosis codes.

Key messages:
- We developed the unbiased disease network that shows progression patterns by adjusting for confounders and using IPW.
- The disease network can be used to extract features from various diagnosis codes in EHR/Claims data, analyze causal effects, and predict disease or healthcare usage using RR or graph embedding.

Contact: lml@clin.au.dk

Background: Lack of social connections has a serious impact on health, increasing the risk of medical conditions such as depression, dementia, and coronary heart disease. However, evidence is limited by a disease-specific focus. We aimed to provide a comprehensive overview of differences in incidence rates of a broad range of medical conditions according to social disconnectedness (i.e., loneliness, social isolation, and low social support).

Methods: We conducted a cohort study using data on loneliness, social isolation, low social support, and a composite measure from the 2013 and 2017 Danish National Health Survey. Survey data was linked with register data on 11 categories of medical conditions through 2021. Poisson regression was applied to estimate incidence rate ratios (IRRs), incidence rate differences, and explore interaction with pre-existing mental disorders.

Results: Among 162,497 survey participants, 7.6%, 3.5%, and 14.8% were identified as lonely, socially isolated, and with low social support, respectively. Lonely individuals and individuals with low social support had a higher incidence rate of all 11 categories of medical conditions (interquartile range of IRRs, loneliness 1.22-1.49 and low social support 1.10-1.14), whereas this was the case for nine categories among socially isolated individuals (interquartile range of IRRs, 1.01-1.31). Applying the composite measure, the highest IRR was 2.61 (95% CI, 2.34-2.88) for a mental disorder and the lowest 1.03 (95% CI, 0.95-1.10) for cancer. We found neither major sex differences nor substantial interaction with pre-existing mental disorders.

Conclusions: Our study confirms and extends the available evidence on social disconnectedness and the risk of medical conditions. The attained knowledge may be of significance for mapping group-specific preventative needs and guiding interventions and health practitioners aiming to reduce the disease burden among socially disconnected individuals.

Key messages:
- Based on survey and register data from 162,497 individuals, our study suggests that social disconnectedness, especially loneliness, is a determinant of a broad range of medical conditions.
- The findings may be of importance for identifying and targeting the disease burden among socially disconnected individuals.

Abstract citation ID: ckae144.345
Pandemic-related PTSD and associated risk factors in the general adult population in the Netherlands

Anouk van Duinkerken

A van Duinkerken[1], *M Bosmans*[1], *C Baliatsas*[1], *M Dückers*[1,2,3]
[1]NIVEL, Utrecht, Netherlands
[2]Faculty of Behavioural and Social Sciences, University of Groningen, Groningen, Netherlands
[3]ARQ National Psychotrauma Centre, Diemen, Netherlands
Contact: A.vanDuinkerken@nivel.nl

Introduction: The COVID-19 pandemic introduced widespread stressors and shocking events, impacting mental well-being. Understanding posttraumatic stress disorder (PTSD) prevalence during the pandemic is crucial, yet existing studies on this topic vary widely in methodological quality. This study aims to fill this gap using a large-scale national survey study to examine PTSD prevalence during the pandemic and compare pandemic-related and traditional shocking events.

Methods: This study uses data from the Dutch Public Health Monitor Adults and Elderly 2022, consisting of 365,000 Dutch adults representative for the general adult population. Pandemic-related and traditional events were assessed and anchored to a screening instrument for PTSD: the Dutch version of the PCL-5.

Results: Two-thirds of participants reported experiencing a shocking event during the pandemic. Exposure to pandemic-related events was reported more frequently than traditional events. Overall probable PTSD prevalence due to these events was 2.4%, evenly split between pandemic-related and traditional events. Among exposed individuals, probable PTSD prevalence was 3.7%. This was higher for traditional than for pandemic-related events. Risk factors for developing probable PTSD after exposure to an event during the pandemic were younger age, financial difficulties, loneliness, low resilience and experiencing multiple events.

Discussion: Exposure to shocking events during the pandemic influenced the prevalence of probable PTSD. Despite the lower relative impact of pandemic-related shocking events compared to traditional events, exposure to pandemic-related shocking events accounted for the same amount of probable PTSD cases in the Dutch general population as 5 common traditional events. This emphasizes the need to address mental health consequences of prolonged crises and the demand for healthcare, and the importance of mitigation strategies based on risk and protective factors.

Key messages:

- Exposure to pandemic-related events accounted for approximately the same amount of probable PTSD cases as 5 frequently occurring traditional events.
- Despite pandemic-related events being reported more frequently, traditional events were associated with a relatively higher prevalence of PTSD.

Abstract citation ID: ckae144.346

Work-related factors associated with workplace wellbeing in marginalized groups: a scoping review

Katja Kraljevic

K Kraljevic[1], PN Doan[1], E Demou[1], P Craig[1], T Kromydas[1]
[1]MRC/CSO Social & Public Health Sciences Unit, University of Glasgow, Glasgow, UK
Contact: k.kraljevic.1@research.gla.ac.uk

Background: Workplace wellbeing, or the physical, psychosocial, and emotional health aspects of working life, can be a predictor of overall health. Promoting workplace wellbeing is key for employers and employees because it impacts productivity, engagement, and physical and mental health. At present there is a gap in our understanding of how workplace wellbeing differs in specific worker populations. This review's objective is to evaluate which work-related factors are associated with workplace wellbeing of marginalized groups in the European Union (EU). We used job quality, work-life balance and job satisfaction to represent workplace wellbeing.

Methods: We followed Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) methodology. Our population of interest was women, immigrant, ethnic minority and/or disabled workers in the EU. We searched the MEDLINE, CINAHL, EconLit, SCI-Expanded, SSCI and SCOPUS databases. Results were restricted to English-language titles published since 1992. No restriction was placed on study design. We used Synthesis Without Meta-analysis (SWiM) guidance to synthesize the results narratively.

Results: We retrieved 2,594 results from the search terms. After full-text screening, 191 studies were included, of which 94 (49.2%) looked at job quality, 50 (26.2%) at work-life balance and 75 (39.3%) at job satisfaction. The most reported negative factors were healthcare jobs, manual work and workplace discrimination; educational attainment and policy co-production were the most frequent positive factors.

Conclusions: Our results indicate prominent inequalities in the workplace wellbeing of marginalized groups across the EU. Additionally, the evidence base on workplace wellbeing in ethnic minority, immigrant and disabled workers is limited. To address this, a larger-scale analysis using cross-EU data and comparing the impact of EU policies on workplace wellbeing of marginalized workers is needed.

Key messages:

- Workplace wellbeing is an important predictor of overall health.
- Our review finds marginalized workers have poorer workplace wellbeing than non-marginalized workers, which could affect their health.

6.D. Skills building seminar: Family Vulnerability Scale: Why and how to use at Primary Health Care to promote health equity?

Abstract citation ID: ckae144.347

Organised by: Hospital Israelita Albert Einstein (Brazil)
Chair persons: Ilana Eshriqui (Brazil), Lorrayne Belotti (Brazil)
Contact: ilana.eoliveira@einstein.br

Family vulnerability encompasses multiple perspectives that are interconnected with the health needs of each family member. Families experiencing vulnerability face heightened risks of poor health outcomes. Nonetheless, these vulnerabilities are further compounded by systemic inequalities within healthcare systems, where biological or clinical factors are exclusively considered to organize and/or prioritize access, especially given the scarcity of valid instruments to measure family vulnerability. Primary Health Care (PHC) plays a pivotal role in addressing health inequalities, especially considering its bond with community. From this context, the Family Vulnerability Scale for Brazil (EVFAM-BR, in Portuguese) was developed and validated, been composed of 14 items about four dimensions (income, healthcare, family and violence) (2019-2023). By reducing the gap between science and practice, the implementation process of EVFAM-BR was started at the same year the scale was validated (2023). First, it occurred at 14 PHC services in São Paulo (Southeast Region, Brazil) and second, since 2024 has been implemented at Boa Vista (North Region, Brazil). Also, between 2024 and 2026, the implementation of EVFAM-BR is expected to take place in other Brazilian states participating in the third phase of the PlanificaSUS project, which is developed aiming to support State health departments to implement the Health Care Planning method to organize and integrate PHC and specialized outpatient care based on population health care needs. At this stage, capacity building is needed to align the concept of family vulnerability and to train PHC managers and health professionals on how to apply and use results from EVFAM-BR. This training has already been performed for around 1,000 health professionals from two different regions of Brazil, including managers, Community Health Workers, nurses, and physicians. The present workshop proposal aims to disseminate the EVFAM-BR and to offer the EVFAM-BR experience. It proposes knowledge transferring throughout participants engagement at three activities. Activity 1) "Family Vulnerability: From concept to a scale validity and application": it is designed to engage participants to discuss about the family vulnerability concept and applicability at PHC, and to discuss on how EVFAM-BR implementation process has been occurring at Brazil and how can be tailored to other contexts. Activity 2) "Role Play: Practicing EVFAM-BR": Two cases will be used for role play dynamics that will take place in trios, in which one will represent the community health worker, another will be the patient and the third will be the observer. Activity 3) That ones that assumed observer role will share their experiences of using EVFAM-BR. Finally, a discussion will be facilitated based on the participants' impressions and a review of the main points covered throughout the workshop.

Key messages:

- Family vulnerability stratification (through EVFAM-BR) is essential to plan services achieving equity and qualified population-based care management and to qualify patient approach and care.
- Family Vulnerability Scale (EVFAM-BR) training represents efforts to reduce the gap between research and practice and contributes to address social determinants of health on healthcare.

Abstract citation ID: ckae144.348

Family Vulnerability: From concept to a scale validity and application

Ilana Eshriqui

I Eshriqui[1], LY de Almeida[1], EL de Souza[1], VE Nascimento[1], JMT de Mendonça[1], FTP Neto[1], F Rebustini[2], EB de Medeiros[1], AAF de Sousa[1], D Bonfim[1]

[2]EACH, University of São Paulo, São Paulo, Brazil
Contact: ilana.eoliveira@einstein.br

This activity will last 20 minutes. An interactive presentation will be structured at three steps. First, a debate will be facilitated to engage participants on the following questions: i. What is family vulnerability? ii. Why should we measure family vulnerability at the context of Primary Health Care (PHC)? Second, once concepts are aligned, a brief presentation about the Vulnerability Family Scale for Brazil (EVFAM-BR) will be performed. At this time, participants will have the opportunity to know about the process of development, validation and the final version of EVFAM-BR (Souza et al., 2023, available at https://doi.org/10.1371/journal.pone.0280857). Third, presenters will share step by step how EVFAM-BR can be implemented into PHC, considering two real-world experiences in Brazil, Southeast and North regions, and will discuss about possible strategies to tailor it at different cultural and geographic context, from settings with higher vulnerability and low resources to high technology settings.

Abstract citation ID: ckae144.349

Role Play: Practicing EVFAM-BR

Ana Alice de Sousa

I Eshriqui[1], LY de Almeida[1], EL de Souza[1], VE Nascimento[1], JMT de Mendonça[1], FTP Neto[1], F Rebustini[2], EB de Medeiros[1], AAF de Sousa[1], D Bonfim[1]
[1]CEPPAR, Hospital Israelita Albert Einstein, São Paulo, Brazil
[2]EACH, University of São Paulo, São Paulo, Brazil
Contact: alice.freire@einstein.br

This activity will last 20 minutes and will consist in a role Play dynamic, when participants will have the opportunity to experience the Vulnerability Family Scale (EVFAM-BR). Groups of three participants will be formed. In each group, one person will represent the community health worker, another will act as the patient and the third will play the observer role. Half of the groups will receive a case (low family vulnerability) and the other half will receive a second case (high family vulnerability, emphasizing a violence situation occurrence).

Abstract citation ID: ckae144.350

EVFAM-BR: Sharing experiences and closure

Ilana Eshriqui

I Eshriqui[1], LY de Almeida[1], EL de Souza[1], VE Nascimento[1], JMT de Mendonça[1], FTP Neto[1], F Rebustini[2], EB de Medeiros[1], AAF de Sousa[1], D Bonfim[1]
[1]CEPPAR, Hospital Israelita Albert Einstein, São Paulo, Brazil
[2]EACH, University of São Paulo, São Paulo, Brazil
Contact: ilana.eoliveira@einstein.br

This activity will last 20 minutes. After Role Play, participants will sit in large circle and the ones that assumed the observer role will share their experiences of using EVFAM-BR. Subsequently, other participants will be invited to share their experiences and impressions about EVFAM-BR. Based on the participants' impressions and a review of the main points covered throughout the workshop, a final discussion and closure of the workshop will be facilitated.

6.E. Practice session: Using European environmental data in public health: datasets and applications

Abstract citation ID: ckae144.351

Organised by: European Environment Agency
Chair persons: Gerardo Sanchez Martinez (Denmark)
Contact: gerardo.sanchez@eea.europa.eu

The European Environment Agency collects, quality-assures and quality-checks data on environment, climate and sustainability. It does so through its network and other institutional partners across 38 European countries. Most of these validated environmental data are publicly available and many can be used by practitioners to assess environmental risks to the health of their communities, as well as for designing and evaluating policies' effectiveness. The objective of this workshop is to provide public health practitioners and scientists with an overview of the EEA data streams of public health relevance, including on air pollution, noise, water pollution, industrial emissions and climate impacts, among others. It will also highlight existing examples of local and national assessments and communication products based on these data, as well as demonstrating how specifically data on air pollution can be used for a quick health impact evaluation. The format of the workshop will be a practice session of 60 minutes with four presentations, the last being a live example demonstration, and an ample session of questions and answers.

Key messages:

- The EEA collects and publishes large, validated datasets of public health from across 38 member countries, including on air and water pollution, industrial emissions, noise and climate change.
- These data can be directly used by practitioners to assess environmental risks to the health of their communities, and to design and evaluate policies, with publicly available models and tools.

Abstract citation ID: ckae144.352

Environmental and health databases used together for boosting a One Health approach

Susana Viegas
National School of Public Health, NOVA University of Lisbon, Lisbon, Portugal
Contact: Susana.Viegas@ensp.unl.pt

Publicly available European environment data, and specifically those collected and published by the European Environment Agency represent a great asset for environment and health researchers and practitioners. This presentation will summarize the use of such data for various environment and health projects and assessments at the National School of Public Health of NOVA University in Lisbon, Portugal.

Abstract citation ID: ckae144.353

EEA data streams of public health relevance: the examples of air pollution, environmental noise and industrial emissions

Sune Djurhuus
Digitalization and Data Management, European Environment Agency, Copenhagen, Denmark
Contact: sune.djurhuus@eea.europa.eu

The knowledge work of the European Environment Agency relies on high-quality data from our network and other institutional partners across 38 European countries. We collect, quality-assure and quality-check data on the environment, climate and sustainability, many of which are of high public health relevance. This presentation will summarize the most importance EEA datasets of public health relevance, including on air pollution, noise, industrial emissions, and others.

Abstract citation ID: ckae144.354

Using EEA environment and health data to communicate with the public: the European Environment and Health Atlas

Gerardo Sanchez Martinez
Health and Environment Group, European Environment Agency, Copenhagen, Denmark
Contact: Gerardo.Sanchez@eea.europa.eu

The EEA European Environment and Health Atlas presents information on how pollution and other environmental risks affect the health and well-being of Europeans. It is almost exclusively built on the datasets that the EEA collects from its network, and it summarizes only environmental information of relevance to public health, as well as health impacts from key environmental risks like air pollution, noise and industrial emissions.

Abstract citation ID: ckae144.355

Using EEA data to calculate health impacts of air pollution via the AirQ+ model: a practical example

Pierpaolo Mudu
European Centre for Environment and Health, WHO/Europe, Bonn, Germany
Contact: mudup@who.int

The AirQ+ software tool for health risk assessment of air pollution, developed by the World Health Organization, helps quantify the effects of exposure to air pollution. Specifically, AirQ+ can estimate the effects of short-term changes in air pollution (based on risk estimates from time-series studies) and the effects of long-term exposures (using life-tables approach and based on risk estimates from cohort studies). AirQ+ is available in English, French, German and Russian. In this presentation, AirQ+ will be loaded with air pollution data from the European Environment Agency datasets for a quick evaluation of health effects from air pollution in an European city.

6.F. Scientific session: Understanding the impact of climate change on health: the latest reports from EEA and NPHIs

Abstract citation ID: ckae144.356

Organised by: UK Health Security Agency, RIVM (Netherlands), Robert Koch Institute (Germany), European Environment Agency
Chair persons: Lisbeth Hall (Netherlands), Svenja Matusall (Germany)
Contact: kelleherk@rki.de

Climate change poses a significant threat to human life and wellbeing worldwide. Extreme weather events like heatwaves, storms or floods can have adverse impacts on health, as can many other factors influenced by climate change, such as allergens, UV radiation and vector-borne diseases. In order to support the action needed to protect and promote health and wellbeing, many National Public Health Institutes (NPHIs) aim to keep relevant stakeholders informed on the scientific evidence of the impacts of climate change on health. Reports that synthesise the evidence can help in the development of suitable and health-relevant climate change adaptation and mitigation measures. In this workshop, European Environment Agency assessments on climate and health are presented, including the European Climate Risk Assessment Report and recent outputs of the European Climate and Health Observatory. Next, three NPHIs introduce their recent national reports on the impact of climate change on health, sharing lessons learned and valuable insights into their content, process and reception, highlighting similarities and differences. The workshop will feature presentations by NPHIs from the United Kingdom (UK Health Security Agency), Germany (Robert Koch Institute), and the Netherlands (National Institute for Public Health and the Environment) as well as the European Climate and Health Observatory. The perspective of the European Climate and Health Observatory offers Europe-wide insights as a provider of tools and knowledge that support actions from NPHIs and other health actors. Our aim is to highlight the value of such reports, and inform and inspire NPHIs and other stakeholders that may be considering the publication of similar reports. The format of the workshop will be informative and interactive, with opportunity for Q&A, discussion, and engagement with the audience. By showcasing the recent reports, the workshop aims to increase awareness of climate change as a public health issue and establish NPHIs as key climate actors. Furthermore, it aims to highlight the importance of having a national, up-to-date evidence base to drive climate measures and enhance resilience.

Key messages:

- National evidence-based reports on climate change and health are a useful tool for informing health-relevant climate change adaptation and mitigation measures.
- Through the public health functions of surveillance, monitoring, responding and evaluating, NPHIs play a crucial role in collating and assessing the evidence on the health effects of climate change.

Abstract citation ID: ckae144.357
From the first European Climate Risk Assessment to action in policy and practice

Aleksandra Kazmierczak

A Kazmierczak[1]
[1]European Environment Agency, Copenhagen, Denmark
Contact: aleksandra.kazmierczak@eea.europa.eu

The first European Climate Risk Assessment (EUCRA), produced by the European Environment Agency in March 2024, engaging nearly 100 authors across Europe, highlights health among the most at-risk sectors. According to the structured risk assessment that was conducted to support the transparent identification of priorities for policy action, more and urgent action is needed to reduce health risks from heat indoors and outdoors; from wildfires and outbreaks of vector- and water-borne diseases. The responsibility for managing risks lies both with the EU and Member States, and the policy readiness varies depending on the risk. The European Climate and Health Observatory, set up to better understand, anticipate and prevent climate risks to human health in Europe, in the most recent report ‘Responding to climate change impacts on human health in Europe: focus on floods, droughts and water quality’ provides in-depth analyses of some climate-related risks to health and presents examples of responses to them in both policy and practice. Both assessments emphasise that without fast and systemic action to increase societal resilience, the health impacts of the changing climate will worsen, affecting already disadvantaged or vulnerable groups the most. Health and health-determining sectors have the opportunity to address the health impacts of climate change by, among others, increasing the climate resilience of health systems; developing, updating and implementing national health adaptation plans; and supporting the education and training of public health and healthcare professionals on climate change threats. At the same time, addressing health impacts from climate extremes requires responses across sectors, actors and spatial scales.

Abstract citation ID: ckae144.358
Health Effects of Climate Change in the UK report 2023

Raquel Duarte-Davidson

R Duarte-Davidson[1], *EL Gillingham*[1], *R Phalkey*[1], *L Berrang-Ford*[1]
[1]Centre for Climate and Health Security, UK Health Security Agency, London, UK
Contact: Raquel.Duarte@ukhsa.gov.uk

The fourth Health Effects of Climate Change in the UK report (HECC) was published by the UK Health Security Agency in 2023. The report brings together 15 independent chapters written by 90 experts from UK and international academic and research institutions and UKHSA. It provides an authoritative summary of the scientific evidence on the health effects of climate change in the UK, potential implications for public health and gaps in evidence. Chapters include a combination of new empirical analyses (using the most updated climate data - UKCP18 projections) and synthesis of new evidence. Topics covered include future UK climate, temperature effects on mortality, flooding, outdoor and indoor air quality, aeroallergens, infectious diseases, vector-borne diseases, food supply, wildfires, drought, human exposure to chemicals, solar radiation, health impacts of net zero and indicators for climate change and public health tracking.

Abstract citation ID: ckae144.359
The German Status Report on Climate Change and Health 2023

Kirsten Kelleher

K Kelleher[1], *M Mlinaric*[1], *H Niemann*[1], *T Ziese*[1]
[1]Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
Contact: KelleherK@rki.de

The German Status Report on Climate Change and Health was coordinated by the Robert Koch Institute, Germany’s public health institute, and published in 2023 through a collaboration of approximately 100 authors from 30 German institutions. It is an update of a similar report from 2010 and includes review articles and syntheses on the effects of climate change on human health through various influences such as heat, extreme weather, UV radiation, air pollutants and allergens, as well as the effect of climate change on infectious diseases through vector-borne, water-borne or food-borne pathogens. Literature reviews on the potential impact on antimicrobial resistance and mental health explore less well researched effects of climate change on health. The report discusses climate change communication and climate justice as cross-cutting issues and closes with an analysis of the options for action recommended throughout the preceding chapters. While the coordination of this report was funded by the German Federal Ministry of Health, the content was compiled by an advisory board of scientists and the authors recruited by them. The status report is published as 14 individual scientific papers in three issues of the peer-reviewed Journal of Health Monitoring and is available open access in English and in German in order to reach a large scientific audience. Besides the scientific audience, another target group are local authorities contributing towards adaptation and mitigation measures. Insights from the report are being communicated by diverse channels specifically to this latter group and are taken into consideration in the process of shaping the German Strategy for Adaptation to Climate Change.

Abstract citation ID: ckae144.360
Assessing the current health effects of climate change in the Netherlands

Lisbeth Hall

L Hall[1], *C Betgen*[2], *S Boekhold*[2]
[1]Centre for Environmental Safety and Security, RIVM, Bilthoven, Netherlands
[2]Centre for Sustainability, Environment and Health, RIVM, Bilthoven, Netherlands
Contact: lisbeth.hall@rivm.nl

The National Institute for Public Health and the Environment (RIVM) has assessed the current effects of climate change on health as part of a national sector-wide process towards updating the Dutch National Adaptation Strategy. Besides health, this process includes assessing the risks of climate change for water management, agriculture, the built environment, nature and other sectors. It will provide a basis for policy, for prioritising the most urgent risks and for long-term risk monitoring. Six climate-related health topics were assessed for this update: heat, air quality, mental health, UV radiation, pollen allergies and infectious diseases. To allow comparison of the impact and likelihood of the climate-related risks across sectors, a format for factsheets on climate risks had been provided. Following this format, for each climate-related health topic we considered the climate threat, secondary effects, exposure, vulnerability, adaptive capacity, impact and cascading effects. The magnitude of the health impacts was categorised per topic as low (< 10,000 people affected; 0 - 10 seriously injured/dead), medium (10,000 - 100,000 people affected; 10 - 100 seriously injured/dead) or high (>100,000 people affected; >100 seriously injured/dead). The likelihood of these impacts was then described as well as possible black swan events or tipping points. Finally, the policy context was outlined, including possible maladaptation, lock-ins, and equity aspects, followed by quality assurance considerations. For all topics, negative health impacts are already occurring. However, the magnitude of the impacts cannot yet be accurately quantified. In this presentation, we will discuss the results of this assessment and explore the pros and cons of being part of a sector-wide process.

6.G. Scientific session: The importance of using country-specific severity distributions in burden of disease indicators

Abstract citation ID: ckae144.361

Organised by: European Burden of Disease Network, EUPHA-CHR, -PHMR
Chair persons: Elena von der Lippe (Germany), Hanna Tolonen (EUPHA-PHMR)
Contact: vonderLippeE@rki.de

One of the most commonly used health gap summary measures in the field of public health is the Disability-adjusted life year (DALY). It has become the key metric for quantifying the burden of disease (BoD) and is used as an information source for setting priorities for health care and health service planning. The DALY metric quantifies gaps between a theoretical population in perfect health and the current health status related to both morbidity and mortality. It is the sum of the number of healthy life years lost due to disability (YLD) and death (YLL). The YLD summarises the loss of healthy life time using the frequency of diseases differentiated by severities or related health states (including sequelae). Depending on each health state, it converts the time spent with diseases into YLD by weighting each year with health limitation with so-called disability weights. This allows the two indicators YLL and YLD to be added to the DALY. Consequently, severity distributions are a means of describing the range of health loss along specific health states, which enables an accurate mapping with disability weights. For most of the diseases, these distributions are usually categorised as mild, moderate, severe, or no health loss (asymptomatic). Conditions with higher severity levels contribute more to the YLD and thus, to the overall disease specific BoD. The severity distributions are highly dependent on utilization at the individual level, but also on available health care services at the society level, which indicates that differences by settings are to be expected. Changes over time in the share of severe cases, for instance, may reflect the effectiveness of health interventions and policies. This underlines the importance of severity distributions, as they also reflect information about the quality of healthcare for those affected. The Global Burden of Disease (GBD) study applies for a significant proportion of their considered diseases uniform severity distributions across countries and broader regions. They acknowledge concerns over applying estimates of severity distributions based on limited data, noting that it is the only available information that they were able to use. As the YLD estimates are often utilized to develop and prioritize health policy interventions, there is a necessity for country-specific estimates that are evidence based and less susceptible to model assumptions. In most cases, the estimation of severity distributions involves complex methodology as data for such assessments are very limited or hardly reliable. In the following workshop, general concepts and country cases from Germany, Scotland, and Belgium will be presented covering a variety of diseases. The examples underline the importance of estimating national and even regional severity distributions when identifying the importance of diseases or comparing the health conditions of populations across time.

Key messages:

- As the Burden of disease indicators are predominantly used to prioritize health interventions and allocate resources, it is crucial to use accurate information in the severity levels of disease.
- Severity distributions reflect the health care services and vary across different settings. Utilising country-specific severity distributions when estimating Burden of Disease indicators is essential.

The Belgian national burden of disease study (BeBOD) was launched in 2022, and currently provides disease burden estimates for 38 key diseases. The calculation of the non-fatal component of the disease burden, the Years Lived with Disability (YLD), follows a stepwise approach that aims to establish priority outcomes; quantify prevalence “best estimates”; establish disease models; and perform expert evaluation of methods and results. The disease models visualize the relationship between the different health states associated with a given outcome. Health states include the different acute and chronic stages of the outcome (including complications), which may be stratified in different severity levels (e.g., mild, moderate, severe). Disease models used in burden of disease studies primarily aim to document the considered health states, and do not aim at a representation of the complete clinical picture of the condition. The disease models instead help in understanding how the number of cases for each health state is calculated. Models typically start with one “parent node”, which contains all cases. This parent node then gives rise to multiple “child nodes”, with the terminal child nodes representing the individual health states. In BeBOD, disease models and severity distributions are adapted from the Global Burden of Disease (GBD) study, and complemented with local data where possible. This process ensures consistency with available disability weights, while still allowing for local data to feed into the calculations. In this presentation, we will demonstrate the BeBOD process for establishing disease models based on a number of archetypical examples, which represent varying challenges linked to disease model complexity, clarity and completeness of the GBD disease model documentation, and availability of local data. Future perspectives will be discussed, including the improved leveraging of local clinical data, and the implementation of tailored active data collection.

Two people living with the same disease can have very different experiences; one has little consequence, whilst the other struggles with much more debilitating consequences that impacts how they live their lives day-to-day. A growing body of research highlights the need for better estimates of disease severity to facilitate better estimation of the non-fatal burden of disease (BOD). Routine data does not always offer solutions because it's often not coded at a granular enough level to map to individual health states. Data offering solutions are scarce and therefore not available across time or space. Most commentators have quantified the problem of assuming the same proportional severity splits to fill data gaps; a problem common to the Global Burden of Disease (GBD) study and independent BOD studies. However, whilst the need for highlighting the problems associated with this assumption remains, there are other positive steps that can be taken to overcome it. We propose how reproducible approaches can be developed, and present how they can be used to develop disease severity estimates. This involves developing a survey instrument to estimate the overall and health state prevalence of back pain and neck pain, basing health state definitions from the GBD non-fatal disease models, where the classification of cases by severity is based on the combination of respondent's answers. Furthermore, we discuss how self-assessed severity estimates allow for internal validity checks, but also more widely offer opportunities to appraise the appropriateness of GBD non-fatal disease models. The development, and publication, of survey instruments can assist both independent studies and the GBD study to improve estimates of disease severity, as well as retaining important opportunities for cross-country comparability. Understanding the spectrum of severity is important for understanding how disease impacts populations and can inform healthcare provision and expenditure strategies.

Exploring changes in the distribution of health status in type 2 diabetes over time - methodological aspects for estimating years lost due to disability for Germany

Michael Porst

M Porst[1], A Rommel[1], K Schüssel[2]
[1]Department of Epidemiology and Health Monitoring, Robert Koch Institute, Berlin, Germany
[2]Research Institute of AOK, Berlin, Germany
Contact: Porstm@rki.de

Knowledge of the severity distribution (SD) of certain diseases is crucial for calculating the years lost due to disability (YLD), as the time spent with a disease is explicitly weighted on the health state level. Depending on the disease, different severity levels are considered. In most cases, the SDs vary from mild, moderate, severe to most severe. This is different in the context of diabetes, where an explicit distinction is made according to the sequelae resulting from the disease progression. In general, these include diabetic neuropathy (with foot ulcers or amputations) and (mild or moderate) vision impairments including blindness due to diabetic retinopathy. These complications cause a considerable loss of quality of life for those affected and high costs for the healthcare system. However, the progression of many of the sequelae can be avoided through (secondary) preventive measures. Estimating the degree of severity is therefore an important indicator of the population affected and in need for care. Due to a lack of data, the Global Burden of Disease Study often uses time-invariant and regionally fixed SDs. Important insights as to the temporal variance of SDs thus remain unnoticed. As part of the BURDEN 2020 pilot project in Germany, SD for diabetes-related complications were estimated from routine health insurance data for the year 2017. In a follow-up project (BURDEN 2.0), these results will also be available for the years 2017 to 2022. If there are any changes in the proportion of individual health conditions, implications can be generated from routine healthcare data of those affected. The SDs overall and according to certain sequelae will be presented over time and discussed. Also, the resulting YLD over time for type 2 diabetes will be examined, including changes in the prevalence of the disease. This makes it possible to analyse and interpret the burden of disease due to diabetes during the years 2017 to 2022.

Abstract citation ID: ckae144.365
Methodological insights into severity distribution of non-fatal cancer burden in Belgium using a microsimulation model (2004-2019)

Robby De Pauw

R De Pauw[1,2], V Gorasso[1,3], B Devleesschauwer[1,4]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium

[4]Department of Translational Physiology, Infectiology and Public Health, Ghent University, Merelbeke, Belgium
Contact: Robby.DePauw@sciensano.be

This study leverages a registry-based microsimulation model to analyze the non-fatal burden of cancer in Belgium from 2004 to 2019, emphasizing the methodology for severity distribution. Utilizing incidence- and prevalence-based approaches, we estimated Years Lived with Disability (YLD) through detailed national cancer registry data coupled with tailored disease models. The microsimulation model employed enabled nuanced translation of cancer incidence into prevalence estimates, incorporating the longitudinal impacts of disease severity influenced by treatment. Methodologically, the model integrated expert elicitation to adjust for treatment-related disabilities, such as surgical aftereffects, enhancing the accuracy of disability weight assignment across different cancer stages. This approach allowed for a dynamic assessment of disease burden, reflecting real-world complexities of cancer prognosis and treatment pathways. Significant findings include a substantial increase in the age-standardized non-fatal burden for non-melanoma skin cancer, highlighting the model's capability to detect shifts in disease impact over time. By focusing on the microsimulation's capacity to delineate severity distributions within the cancer burden landscape, this analysis underscores the model's utility in refining health policy decisions and resource allocation. Ultimately, this study presents a robust framework for national burden of disease studies, facilitating detailed evaluations of health interventions and their longitudinal effectiveness.

6.H. Round table: Harnessing Patient-Reported Data for Health Innovation: Insights from the OECD PaRIS Initiative

Abstract citation ID: ckae144.366

Organised by: PaRIS Consortium, EUPHA-HSR
Chair persons: Johan Hansen (EUPHA-HSR), Mieke Rijken (Netherlands)
Contact: i.porter@exeter.ac.uk

Summary: This round table will disseminate knowledge and foster discussions on data reported by patients with a chronic disease in primary care settings in 20 countries for enhancing health system responsiveness and effectiveness. By delving into the OECD's Patient-Reported Indicator Surveys (PaRIS) survey's development, adaptation, and analytical strategies, participants will leave with a richer understanding of how patient-reported data can inform and transform health policy and practice in Europe and beyond.

Rationale: The round table aligns with the Conference theme by focusing on the transformative potential of patient-reported data in health systems. OECD PaRIS provide a unique lens through which to examine patient-centered care, showcasing innovative methods to capture and utilize data across diverse health system contexts. This round table will explore the development, adaptation, and analysis of this flagship survey, revealing its critical role in shaping health policies and practices that are attuned to patient needs and experiences.

Objectives: 1. Understanding Development and Testing Processes: To gain insights into the systematic approaches used in developing patient-reported instruments that are both robust and sensitive across multiple healthcare settings; 2. Exploring Co-development and Adaptation: To discuss the challenges and strategies involved in adapting health surveys to various national contexts while ensuring stakeholder engagement and data relevancy; 3. Analyzing Data for Policy Making: To comprehend the analytical frameworks used in processing patient-reported data for crafting effective health policies and identifying factors that influence patient outcomes.

Key messages:

- Patient reported data on experiences and outcomes provide essential information for health systems performance.
- Unique insights into the systematic collection of such information can be gathered through the proposed discussion on the experience of designing and implementing the PaRIS Survey.

Abstract citation ID: ckae144.367

Patient-Reported Indicator Surveys (PaRIS): measuring patient reported experiences and outcomes across populations and health systems

Ian Porter
PaRIS Consortium, University of Exeter, Exeter, UK
Contact: i.porter@exeter.ac.uk

We aimed to develop and test the performance of a questionnaire for adults (aged 45 or older) with one or more chronic conditions who use primary/ambulatory care across populations and health systems in multiple countries. Candidate scales and items were identified through a systematic process supported by international stakeholders (PaRIS Patient Advisory Panel, Technical Advisory Community and Working Party members of participating countries). Four instruments for each domain, covering patient reported outcome measures (PROMs), patient reported experience measures (PREMs), health behaviours, and health and health care capabilities, were shortlisted using predefined criteria and evaluated using the EMPRO method. A modified Delphi supported selecting a core instrument for each domain and additional relevant scales/items. Consultations took place with the stakeholders to confirm the suitability of the proposed questionnaire. The questionnaire was evaluated through cognitive testing and further modified accordingly. The survey was piloted in a Field Trial. Psychometric evaluation was conducted with data from a Field trial on an item level and scale level. Out of 217 instruments, the Delphi resulted in consensus on a core instrument for each main domain and additional questions to ensure comprehensiveness. The cognitive testing of the draft survey (17 languages, 20 countries) confirmed that most questions were interpreted as intended. The version of the survey developed for the field trial included 118 questions. The field trial psychometric evaluation was based on 10,145 patients, across 18 countries. The questionnaire performed well at item level and at scale level. Performance in terms of structure and validity was good overall. A revised version of the patient questionnaire was created with 115 items. A comprehensive questionnaire has been constructed based on the PaRIS survey framework for people living with chronic conditions and following an inclusive approach.

Abstract citation ID: ckae144.368

Patient-Reported Indicator Surveys (PaRIS): making the case for co-development and adaptation to national contexts

Candan Kendir
Health Division, OECD, Paris, France
Contact: Candan.Kendir@oecd.org

In this presentation we discuss the early implementation of the OECD's Patient-Reported Indicator Surveys (PaRIS) in primary care, highlighting the importance of co-development and national adaptation. The PaRIS initiative focuses on collecting patient-reported outcome measures (PROMs) and patient-reported experience measures (PREMs) from individuals with chronic conditions and their primary care providers. This data collection is critical as populations age and the prevalence of chronic conditions increases, necessitating health systems that prioritize patient-centered care. The co-development process of the PaRIS survey involved extensive international collaboration, incorporating feedback from policymakers, healthcare providers, patients, and academics, thereby enhancing the relevance and ownership of the project. An example of successful stakeholder engagement is the creation of the PaRIS Patient Advisory Panel, which included representatives from various patient organizations who participated in all stages of the survey's development. Challenges encountered during pilot implementations varied by country, influenced by factors like existing data infrastructures and regulatory environments. For instance, countries lacking robust data collection systems faced more significant hurdles in adapting the survey to their contexts. The article emphasizes that while rigorous standardization is essential for making international comparisons, adaptation to local contexts is crucial for addressing specific implementation challenges. The joint efforts of all stakeholders are vital for the success of international initiatives like the PaRIS survey. Such collaborative efforts not only facilitate the collection of meaningful data but also contribute to the enhancement of primary care quality through informed policymaking and improved patient care practices.

Abstract citation ID: ckae144.369
From Data to Decisions: Analyzing PaRIS for Health Policy Insights

Peter Groenewegen
PaRIS Consortium, NIVEL, Utrecht, Netherlands
Contact: P.Groenewegen@nivel.nl

To inform countries on how well they perform from the perspective of people living with chronic conditions in comparison with other countries, we propose an analytical framework for the data collected in the PaRIS survey, detailing how the data will be analysed in a multilevel approach for cross-country comparison. The data structure of the PaRIS survey represents three levels: countries/health systems, primary care practices and patients. Multilevel analysis is used because of its accuracy in estimating country-level outcomes, its flexibility in modelling relationships, and its opportunities in connecting to relevant policy questions. Country-level outcomes will be estimated to facilitate cross-country comparison and (future) within-country comparison over time. A first indication for areas for cross-country learning and policy making is the distribution of variation over patients, care providers and countries. Characteristics of patients that potentially explain variation in patient-reported outcomes and experiences can be linked to primary care practice and country/health system characteristics. The second indication for areas for cross-country learning and policy making is the variation in the slope of the association between patient and practice characteristics and patient-reported outcomes and experiences. This makes it possible to address policy-relevant questions relating, e.g., to whether some health systems or providers are better able to produce positive outcomes and experiences for (e.g.) older patients, and to the impact of chronic care management on patients with a specific chronic condition. To ensure fair cross-country comparisons, all outcomes will be estimated for an OECD (age and sex standardised) reference population, also including case-mix adjustment where necessary. Analyses will be repeated using a country-specific standard population.

6.I. Round table: Strengthening preparedness for public health emergencies: lessons learned and future perspectives

Abstract citation ID: ckae144.370

Organised by: ECDC
Chair persons: Sara Mazzilli (France), Ebba Rosendal (Portugal)
Contact: ebba_rosendal@hotmail.com

In the face of intensifying global health threats, robust health security measures in Europe and worldwide have never been more pressing. The COVID-19 pandemic has underscored the critical need for coordinated action, adaptive strategies, and robust collaborative mechanisms to effectively respond to emerging infectious diseases and other public health emergencies. This workshop serves as a platform to examine the multifaceted landscape of health security actors, focusing on collaborative initiatives and lessons learned from recent crises. By convening experts and stakeholders from across Europe, the workshop aims to achieve several key objectives:

i) To provide an overview of collaborative initiatives established to strengthen European and international health security. By showcasing successful models of cooperation, participants will gain insights into effective strategies for fostering collaboration among diverse stakeholders.

ii) Emphasize the role of European and international institutions, such as the European Centre for Disease Prevention and Control (ECDC) and the World Health Organization (WHO), in supporting states both in coordinating regional response efforts and in developing the necessary health workforce competencies and capabilities to respond to health emergencies.

iii) Drawing on experiences from recent health emergencies, including outbreaks of high-risk pathogens, such as Ebola, the workshop will facilitate a critical examination of lessons learned. Through interactive discussions, participants will identify challenges, best practices, and opportunities for enhancing preparedness and response capacity.

iv) By interactive presentations and panel discussions, the workshop will provide a platform for knowledge exchange and networking among participants. By sharing experiences, expertise, and innovative approaches, participants will contribute to a collective understanding of the challenges and opportunities in strengthening health security.

This workshop seeks to illuminate key strategies, capacity-building efforts, and real-world lessons learnt that contribute to enhancing response capabilities to public health emergencies. Participants will gain a deeper understanding of emergency participation mechanisms, essential skills required, and available training resources to enhance preparedness.

Key messages:
- Collaboration and adaptive strategies are essential for strengthening international health security in the face of emerging infectious diseases and other public health emergencies.
- Lessons learned from recent crises provide valuable insights into effective response strategies and opportunities for enhancing preparedness and response capacity.

Abstract citation ID: ckae144.371
The EU Health Task Force, supporting preparedness and response in the European Union and globally

Adriana Romani Vidal

A Romani Vidal[1], E Severi[1], D Cauchi[1], D Obach[1], E Lof[1], S Forato[1], T Hofmann[1], V Lefevre[1]
[1]Public Health Functions Unit, ECDC, Stockholm, Sweden
Contact: adriana.romani@ecdc.europa.eu

The COVID-19 pandemic revealed shortcomings in the European Union (EU) mechanisms for managing public health threats. In 2022, the European Centre for Disease Prevention and Control (ECDC) was mandated to establish the EU Health Task Force (EUHTF) to strengthen preparedness and response at country, EU and global levels. The EUHTF is coordinated by an ECDC Permanent Capacity and relies on pools of experts including ECDC experts, ECDC fellows and European public health experts that can be mobilized for specific assignments or broad public health emergencies. Members from EU/ Economic European Area (EEA) countries, EU agencies, the European Commission, WHO and non-profit organizations advise ECDC on the EUHTF establishment. From May 2023 to April 2024, the EUHTF addressed 13 requests for support from seven EU countries and three non-EU countries. The requests were related to preparedness (e.g. after-action reviews, simulation exercises, mass gathering preparation, capacity building) and emergency response activities (e.g. risk assessment, operational research during crisis, emergency and outbreak response). The EUHTF is operational and able to mobilize expertise from ECDC, the ECDC fellowship and EU/EEA countries. The EUHTF Pool of External Experts, comprised of public health professionals across various levels and institutions of the EU/EEA, is poised to offer comprehensive and robust expertise. Through these resources, the EUHTF is collaborating with and reinforcing the work of EU institutions and other international partners in strengthening preparedness and response.

The EUHTF is a new and structured EU-level approach to public health crises, ensuring tailored in-country support to EU and non-EU countries in preparedness strengthening and crisis response.

Abstract citation ID: ckae144.372
The European Mobile Laboratory: key insights from a decade of outbreak response

Emily Nelson

E Nelson[1], *S Duraffour*[1]
[1]The European Mobile Lab, The Bernhard Nocht Institute for Tropical Medicine, Hamburg, Germany
Contact: nelson@bnitm.de

EMLab has responded to emergencies including the West Africa Ebola virus outbreak (2014-2016), the COVID-19 pandemic, and outbreaks of yellow fever, Marburg virus, and Lassa fever. It has deployed mobile labs and experts to many countries, including Guinea, Liberia, Sierra Leone, Nigeria, Uganda, the Democratic Republic of the Congo, Germany, and Greece. With accumulated experience from each deployment, EMLab's diagnostic expertise has evolved beyond RT-PCR and serological testing to include basic point-of-care tests, haematology, and genomic surveillance capacities, also focusing on interoperability with other response capacities such as EMTs. Critical to mission success, the organization works closely with the WHO and GOARN, and was certified in 2023 as an official German response capacity within the European Civil Protection Pool. The two-year continuous deployment from 2014-2016 was pivotal in shaping EMLab's evolution, also leading to significant capacity-building efforts in West Africa. In Guinea, for example, a surveillance network of three diagnostic laboratories has been established and successfully detected cases of viral haemorrhagic fevers, including the re-emergence of Ebola virus and the first reported case of Marburg virus in Guinea in 2021. Ultimately, EMLab's extensive experience demonstrates that effective public health emergency response requires constant evolution, strategic partnerships, and a commitment to building local capacities, paving the way for a more resilient and prepared global health community.

Training for outbreak response through the Global Outbreak Alert and Response Network

Basel Karo

B Karo[1]
[1]WHO Collaborating Centre for GOARN, Information Centre for International Health Protection, Berlin, Germany
Contact: karob@rki.de

The WHO designated the Information Centre for International Health Protection (INIG/ZIG 1) at the Robert Koch Institute as the first WHO Collaborating Centre for Global Outbreak Alert and Response (WHO CC GOARN). Its mandate is to aid WHO's efforts in improving the detection of public health events and enhancing preparedness, readiness, and capabilities for alerts and rapid responses. The main focus of WHO CC GOARN at RKI include supporting WHO in the development and implementation of the GOARN training programme on international outbreak alert and response, as well as facilitating knowledge exchange and information dissemination. GOARN's extensive engagement in international public health response underscores the need to complement technical expertise with human-centred competencies like effective communication and teamwork, while respecting diversity. On 18 -22 September 2023, WHO CC GOARN at RKI hosted the first "GOARN Outbreak Response Leadership Training Programme", inviting 24 public health leaders plus highly experienced mentors from all WHO. The training was designed to enhance leadership mind-sets and practices, including advanced interpersonal and situational awareness, managing polarised tension, establishing trusted relationships with stakeholders, and influencing collective decision-making. Alongside expert facilitators and experienced mentors from various fields, participants engaged in open discussion, shared experiences and reflected on lessons from the COVID-19 pandemic and other recent outbreaks. This course provided an opportunity to engage with diverse, experienced and highly regarded leaders, sharing their views and personal experiences on what it means to practise leadership in health emergency response. This training also aimed to build a network of diverse, well-trained and interconnected public health leaders, upholding the principles of diversity, equity and inclusion to ensure that our response efforts resonate with the communities we serve.

6.K. Pitch presentations: Health literacy across generations

Abstract citation ID: ckae144.374
Digital health literacy of adults with low reading and writing skills: A mixed-methods study

Saskia Muellmann

S Muellmann[1,2], *R Wiersing*[1,3], *T Brand*[1,2,3]
[1]Leibniz Institute for Prevention Research and Epidemiology, Bremen, Germany
[2]Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany
[3]Leibniz Living Lab, Bremen, Germany
Contact: muellmann@leibniz-bips.de

Background: Around 12% of the adult population living in Germany have low reading and writing skills. Little is known about their digital health literacy and use of digital health technologies. The objectives of the Liter@te study were to assess the digital health literacy of adults with low reading and writing skills and to explore which digital tools they used in everyday life.

Methods: A cross-sectional survey ($n = 96$) and five focus groups ($n = 39$) were conducted with adults aged 18-64 years with low reading and writing skills. Digital health literacy was measured using the eHEALS scale and compared with results from a nationwide sample.

Focus group participants completed a task course on digital health information and then discussed their experiences. Survey data were analyzed using descriptive statistics and logistic regression. Qualitative content analysis was applied to analyze the focus group data.

Results: Survey participants were on average 44 years old, 72% were female and 92% were not born in Germany. Compared to the nationwide survey, use of digital health technologies and digital health literacy were lower. In addition, use of digital health technologies was associated with higher digital health literacy. Lack of technical skills, language problems, and searching and finding health information online were most challenging for focus group participants (mean age 43 years, 87% female). Focus group participants reported that they prefer videos when searching for health information online and seek support from family members or local organizations if they cannot find a solution to their health issue.

Conclusions: Adults with low reading and writing skills search for health information online, but have difficulties to find the appropriate information. Interventions to promote digital health literacy are needed to ensure that persons with low reading and writing skills are not further left behind.

Key messages:

- Adults with low language skills have a low digital health literacy.
- Reading and writing requirements and lack of technical skills make it difficult for them to search health information online.

Abstract citation ID: ckae144.375
Health literacy from the perspectives of children and adolescents - a meta-ethnography

Isolde Sommer

I Sommer[1], *K Seidl*[1], *L Affengruber*[1], *L Stauch*[2], *D Rojatz*[3], *A Wahl*[3], *L Gugglberger*[3], *O Okan*[2], *U Griebler*[1]
[1]Department for Evidence-based Medicine and Evaluation, University for Continuing Education Krems, Krems, Austria
[2]The Entrepreneurial University, Munich, Austria
[3]Austrian National Public Health Institute, Vienna, Austria
Contact: isolde.sommer@donau-uni.ac.at

Background: The current literature on health literacy rarely considers the views of children and adolescents. The aim of our qualitative evidence synthesis was therefore to develop a child- and adolescent-centered conceptualization of health literacy.

Methods: We conducted a meta-ethnography of qualitative studies. Our iterative literature search considered the literature up to November 2023. We dually screened 1596 abstracts and 97 full texts, assessed the methodological limitations of the 32 included studies, and considered 21 data-rich studies in the analysis. We extracted first- and second-order constructs, translated the studies into each other, and developed a coherent argumentation. We dually assessed the trustworthiness of the evidence.

Results: The resulting model comprises micro-, meso-, macro- and chronosystems. It highlights the influence of demographic, cognitive and psychological factors on the development of health literacy in children and adolescents at the micro level, the social environment, including family, friends, peers, teachers, and health professionals at the meso level, and the media and internet, the health and education system, the living environment, and the social narrative about health at the macro level. The chronosystem shows the impact of upbringing, development, and experience. Children absorb health information actively and passively, employing various strategies to evaluate its trustworthiness. They seek advice from their social environment, which acts as a source of information and influencing factor. Different types of information are weighed up and ranked before action is not taken.

Conclusions: Existing models of health literacy are too one-dimensional to be applied to children and adolescents and do not consider their social and living environment. The proposed model offers a comprehensive understanding of health literacy in children and adolescents. It can be used as a basis for future interventions to improve health literacy.

Key messages:

- Health literacy of children and adolescents is significantly influenced by a combination of internal and external factors.
- By incorporating the perspectives of children and adolescents, we have developed a more inclusive and nuanced understanding of health literacy.

Abstract citation ID: ckae144.376
Enhance physical, mental and academic wellbeing of pupils in Germany through digital health literacy

Denise Renninger

D Renninger[1,2], *L Stauch*[1,2], *L Fischer*[3], *A Hartmann*[3], *P Rangnow*[3], *K Dadaczynski*[3], *O Okan*[1,2]
[1]School of Medicine and Health, Technical University of Munich, Munich, Germany
[2]WHO Collaborating Centre for Health Literacy, Technical University of Munich, Munich, Germany
[3]Department of Health Sciences, Fulda University of Applied Sciences, Fulda, Germany
Contact: denise.renninger@tum.de

Background: Digital health literacy (DHL) involves the ability to find, understand, appraise, and apply health information from digital sources. It serves as the foundation for informed decision-making about one's health and well-being using digital technology and online health information sources and services. Despite its significance, the role of DHL in relation to schoolchildren's wellbeing remains underexplored. Therefore, this study aims to investigate how schoolchildren's DHL influences their physical, mental, and academic well-being.

Methods: The cross-sectional survey comprised a representative sample of $N = 1448$ school-aged children (9-18 years) living in Germany. DHL was assessed via a translated and adapted version of the DHL instrument. The assessment of physical, mental, and academic well-being relied on the KINDL questionnaire. Linear regression analyses were conducted, with the scale score of physical, mental, and academic well-being serving as dependent variables and DHL as predictor. Additionally, potential confounding variables such as sex, age, migration background, subjective family wealth, chronic illness, and subjective health status were included in the analyses.

Results: All three regression models were significant (physical: $F(9,1325) = 34.99$, $p < .001$; $R2 = 0.19$; mental: $F(9,1320) = 27.43$, $p < .001$; $R2 = 0.16$; academic: $F(9,1336) = 15.19$, $p < .001$; $R2 = 0.09$). DHL significantly predicted physical ($B=.08$, $p=.01$), mental ($B=.17$, $p<.001$), and academic ($B=.21$, $p<.001$) wellbeing.

Conclusions: This study provides the first evidence of the predictive power of DHL for schoolchildren's physical, mental, and academic well-being. It emphasizes the importance of promoting DHL in schoolchildren to empower them to find, understand, appraise, and apply digital health information effectively.

Key messages:

- Digital health literacy significantly predicts schoolchildren's physical, mental, and academic well-being.
- Promoting digital health literacy can empower schoolchildren to make informed decisions about their well-being.

Advancements in health promotion and prenatal medicine have made noninvasive prenatal testing (NIPT) a common practice during pregnancy, but understanding prenatal health information becomes crucial not only for the well-being of the mother but also for that of the unborn child. Analyze health-related information during pregnancy is fundamental, and this work fits perfectly with this topic, reporting preliminary results from the pilot study "SaperePer". A health-related questionnaire was administered to 358 women in the first trimester of pregnancy, aiming to study different outcomes: 1.level of knowledge of NIPT; 2.number of screening tests undergone; 3.willingness to undergo a diagnostic test with a high outcome risk of screening test; 4.willingness to end the pregnancy following a diagnosis of pathology. The questionnaire was divided into 3 sections: personal characteristics and lifestyle habits, prenatal health behavior scale (PHBS), and knowledge of NIPT. Preliminary results showed that the level of knowledge of NIPT was higher in older, atheist, working, wealthy highly educated, and preliminary informed women, as well as the higher number of screening tests undergone and the propensity to undergo an invasive diagnostic test after a high-risk screening result (KS and MW tests $p < 0.05$). On the contrary, women with lower education, faithful and, even more, not preliminary and appropriately informed during prenatal counseling showed lower knowledge of NIPT, lower number of tests undergone, and meager chances to undergo an invasive diagnostic test or to end the pregnancy after a positive diagnosis of pathology (KS and MW tests $p < 0.05$). In conclusion, this study evaluated health-related information during the first but crucial stages of pregnancy, opening a new understanding of how health literacy and correct prenatal counseling could increase awareness and health promotion in pregnant women, particularly in those women with lower cultural tools.

Key messages:

- Health literacy and correct prenatal counseling could increase awareness and health promotion in pregnant women.
- Understanding prenatal health information becomes crucial both for maternal and prenatal well-being.

Abstract citation ID: ckae144.378

Limited critical and communicative health literacy is related to poorer health among older adults

Pia Svensson

P Svensson[1,2], J Agerholm[2], J Wångdahl[2]
[1]Social Medicine and Global Health, Lund University, Malmö, Sweden
[2]Aging Research Centre, Karolinska Institute and Stockholm University, Stockholm, Sweden
Contact: pia.svensson@med.lu.se

Background: Health literacy-related challenges are expected to increase with age due to a discrepancy between individual capacity and health care demands. Knowledge about associations between health literacy and age-related health outcomes among older adults is scarce. This is important to address and promote optimal health in older adults. The study aims to investigate the association between health literacy and health status among older adults and explore differences between the younger old and the oldest old adults.

Methods: Cross-sectional study using SWEOLD population-based data from 2022, a national representative sample of people 77+ years in Sweden. Univariate and multivariate logistic regression analysis assessed associations between communicative- and critical health literacy and health outcomes. Models were adjusted for age, sex, and socioeconomic status, and stratified by age.

Results: Significant adjusted associations were found between inadequate and problematic health literacy and less than good self-rated health (OR 2.64, 95%CI: 1.61-4.33; 2.11, 95%CI: 1.40.3.17), and requiring assistance with medicine management (OR 5.26, 95%CI: 2.67-10.38, 2.14, 95%CI 1.08-4.22). Among the younger old (77-84 years) inadequate and problematic HL was associated with having lifestyle-related conditions (OR 1.77, 95%CI: 1.07-2.93, 2.75, 95%CI: 1.33-2.71). Among the oldest old (85+), inadequate health literacy was associated with higher likelihood of poor activities of daily living (ADL) (OR 4.48, 95%CI: 1.99-10.07) and frailty (OR 3.51, 95%CI: 1.43-8.47). Level of frailty increases earlier in age for individuals with limited HL than among those with sufficient HL.

Conclusions: Limited health literacy is a prevalent issue in the older population and is associated with negative health-related outcomes. To mitigate development of poor health and frailty and to promote healthy ageing, care organisations need to meet the needs of this population in a health literacy friendly way.

Key messages:

- Limited health literacy among the older population is associated with several negative health-related outcomes.
- Care organisations need to work actively to mitigate the development of poor health while promoting healthy aging among the older population in a health literacy-friendly and age sensitive manner.

Abstract citation ID: ckae144.379

Using PPI and UDL principles to design a gastrointestinal endoscopy patient information video series

Sean Fennessy

S Fennessy[1], L Mulcahy[1], B O'Donnell[1], H Mulcahy[1], M Spooner[2], E McDermott[1]
[1]Department of Gastroenterology, St Vincent's University Hospital, Dublin, Ireland
[2]Department of Medicine, RCSI, Dublin, Ireland
Contact: sfennessy@hotmail.com

Introduction: Patients undergoing GI endoscopy often experience anxiety and due to limited health literacy. Traditional paper-based information leaflets are often not sufficient to accommodate for the diverse way in which people consume information. Public and patient involvement (PPI) and universal design for learning are two well-described pedagogical principles. We wanted to use these principles to design more effective patient education materials.

Objectives: Given the heterogeneity of resources available to patients, the authors wanted to develop a high-quality and trustable video resources for patients that would be available on our hospital website. These videos would be co-designed by patients and ancillary staff, through the formation of a key stakeholder panel.

Results: Using PPI principles, we were able to improve the relevance and quality of our content, through the use of storyboards and the expertise of the stakeholder panel. Through the three key UDL principles of multiple means of representation, engagement and action and expression, we were able to ensure that our videos were accessible and appropriate for all of our patients. Initial feedback from stakeholders and patients provided valuable insights, prompting necessary adjustments for accuracy and patient understanding. This comprehensive approach underscores the commitment to enhancing healthcare delivery. Our project is the first guide in combining both pedagogical principles in the development of patient information and education materials.

Conclusions: The meticulous steps taken, from stakeholder engagement to video production, reflect a commitment to inclusivity and patient-centred care. Ongoing evaluation and feedback mechanisms ensure continuous improvement, contributing to the overall success and sustainability of the digital service.

Key messages:

- This is the first research/patient education piece designed using both PPI and UDL principles.
- The importance of patient-centred educational design is key to improving health literacy and education in our patients.

Abstract citation ID: ckae144.380
Does School Education Improve Children's Health Literacy? Evidence from a Performance-Based Survey

Raffael Heiss

R Heiss[1], L Schamberger[1], E Leuprecht[2], D Schütze[2], M Überall[3], C Zoller[1], F Sahling[1], S Gell[1], R Griebler[2]
[1]Center for Social & Health Innovation, MCI Management Center Innsbruck, Innsbruck, Austria
[2]Austrian National Public Health Institute, Vienna, Austria
[3]Department of Secondary Vocational and Genera, University College of Teacher Education Tyrol, Innsbruck, Austria
Contact: raffael.heiss@mci.edu

Background: Children begin using digital sources of health information at a young age and are quickly exposed to a variety of unmoderated health content. Health literacy helps children navigate, understand, evaluate, and act on this content. But is the educational system preparing young people for these tasks? This study develops a validated, performance-based measure of health literacy and applies it to a sample of 9- to 13-year-old children (grades 4 to 7).

Methods: A performance-based tool to measure children's health literacy was developed through expert consultation and qualitative and quantitative pretesting. The tool uses vignettes and quizzes and captures three dimensions of health literacy: nutrition, physical activity, and psychosocial health. The validated tool was then used in a cross-sectional survey of Austrian children aged 9 to 13 years (n = 780): Diet, Physical Activity, and Psychosocial Health.

Results: Results show that the performance-based health literacy scores do not correlate with self-reported scores. Girls (vs. boys) and native speakers perform better on the performance-based literacy test, while boys and children reporting more robust financial backgrounds overestimate their literacy on self-reported questions. Most importantly, the data do not show meaningful increases in performance-based health literacy across grade levels. For nutrition literacy, the study even shows a slight negative trend across grade levels.

Conclusions: This study questions the heavy reliance on self-reported health literacy, which is often confounded with self-efficacy and social environment. Performance-based instruments are needed to measure health literacy as an educational outcome. This study presents one of the first validated instruments. Most importantly, the study shows that the current educational system may not produce meaningful increases in performance-based health literacy, calling for deeper educational reforms.

Key messages:

- Performance-based health literacy is a distinct concept from the subjective health literacy measures that dominate current health literacy research.
- Performance-based health literacy did not increase with grade level, indicating a poor performance of the education system in strengthening health literacy.

6.L. Pitch presentations: Health policy evaluations

Abstract citation ID: ckae144.381
Policies and programs on children's health promotion in the EU in the context of the JA Health4EUKids

Angela Giusti

A Giusti[1], V Di Stefano[1], P Scardetta[1], F Zambri[1], V Palermo[1], A Di Nolfi[1], A Dittami[1], G Martelli[1], C Cattaneo[1], &Health4EUKids Joint Action Group[1]
[1]National Centre of Epidemiology, Surveillance, National Institute of Health, Rome, Italy
Contact: angela.giusti@iss.it

Background: Overweight and obesity prevalence are a global public health challenge. The prevalence is rapidly increasing, with significant health risks such as cardiovascular disease, type 2 diabetes, and cancer.

Objectives: To describe the state of the art of policies and programs (PPs) on children's health promotion and responsive parenthood (children 0-12 years) in the EU, and to identify their gaps.

Methods: A cross-sectional study was carried out through an online survey, as part of the Health4EUKids Joint Action (JA) (HADEA n.101082462), between October and December 2023, targeting all EU member states (MSs) involved.

Results: The survey collected information about 74 PPs from 11 EU MSs of the JA. The PPs are primarily focused on healthcare (62.1%), education (24.1%), and social sectors (10.3%), with a focus on children aged 6-11 years. The settings for PPs include primary schools, communities, secondary schools, and healthcare services. The PPs are characterized by different degrees of innovation, controversy, equity, transferability, and sustainability, although the structural or systemic impact and public visibility appear to be lower among other characteristics. The formulation and design of PPs include problem analysis (73%), based on national or local data and on stakeholder consultation. As for implementation, most PPs are implemented upon release, but recommended action and allocated human resources are not fully adequate. Regular monitoring and evaluation (47.3%) are based on defined outcomes, standards, and indicators (63.5%). The results are disseminated to decision-makers and stakeholders (37.8%), through media, and to the general population (32.4%).

Conclusions: Most PPs are variable and context-dependent. It is necessary to align the policies with the implementation, in all its aspects, and to strengthen monitoring, evaluation, and communication with the relevant stakeholders, which currently appear to be the most lacking aspects.

Key messages:

- Most European policies and programs are context-dependent, mainly in healthcare. Yet, a cross-sectoral trend involving health, education, and social sectors emerges.
- The study stresses the need for better alignment between policy formulation and implementation to enhance the effectiveness of EU children's health programs.

Abstract citation ID: ckae144.382
'Health in all policies": effect on health outcomes and collaboration among welfare actors

Treisy Villegas

TM Villegas-Gomez[1], *J Sundewall*[2]
[1]Public Health, Lund University, Malmö, Sweden
[2]Social Medicine and Global Health, Lund University, Lund, Sweden
Contact: treisy.villegasg@gmail.com

Background: The 'Health in All Policies' (HiAP) approach, introduced in 2006, recognises the impact of policy decisions and actions on population health. It prioritises health and well-being as a core objective of all public policymaking, ensuring that policies promote health equity and social justice. Implementing HiAP requires collaboration among diverse welfare actors beyond healthcare. Thus, reviewing evidence of the effects of HiAP on collaboration among welfare actors and health outcomes is crucial for informing policy and practice intersectoral collaboration to improve population health outcomes. This study addresses the question: What is the existing evidence of the effects of HiAP on better collaboration among welfare actors and improved health outcomes from 2006 to 2023? We conduct a scoping review on peer-reviewed articles following the Joanna Briggs Institute reviewer's manual, the five-stage framework outlined by Arksey and O'Malley, and adhering to the PRISMA extension for scoping reviews for reporting.

Preliminary results: 472 research articles and 68 other documents published from 2006 to 2023 were identified, mainly from Europe and North America. 90% of the reviewed studies focused on collaboration among welfare actors, while 10% examined the effect of HiAP on improved health outcomes. Themes identified in the studies on collaboration among welfare actors include funding, intersectoral partnerships, shared vision, local and national settings, identity and responsibilities, accountability, dedicated staff, Health Impact Assessment, and indicators.

Conclusions: Despite being widely referred to as an effective approach in health policy, there is limited evidence of the effects of HiAP on health outcomes. However, some evidence supports that HiAP contributes to enhanced collaboration among welfare actors, potentially leading to better health outcomes. More evidence is needed that specifically investigates the effects of the HiAP approach on health outcomes.

Key messages:

- Most evidence suggests that HiAP has a positive impact on collaboration among welfare actors; however, evidence of its effects on health outcomes is limited.
- Further research that specifically explores the effects of the HiAP approach on improved health outcomes is crucial for informing policy and promoting intersectoral collaboration.

Abstract citation ID: ckae144.383
Why is regulation of the online world urgently needed to protect children's wellbeing?

Louise Signal

L Signal[1], *M Smith*[1], *M Gurtner*[1], *R Gage*[1]
[1]Health Promotion & Policy Research Unit, University of Otago, Wellington South, New Zealand
Contact: louise.signal@otago.ac.nz

Background: The online world affords children many benefits, such as connectivity and access to educational and cultural content. Simultaneously, it increases their likelihood of encountering harmful or distressing web-based content and behaviour, such as marketing for harmful products, violent or discriminatory material, and cyberbullying. Yet, there is a dearth of objective research globally on children's real-time experiences, with current research relying on self-reports or observations made in experimental conditions. This paper reports on the nature and extent of children's online world.

Methods: Kids Online Aotearoa is a cross-sectional observational study of children's real-time experiences of the online world. A strategic sample of 180 12-year-olds from schools in the Wellington region of Aotearoa, New Zealand, used Zoom video conferencing software to record their online world for four days. Recordings were analysed manually and using AI.

Results: Children spend most of their time online on their phones, often using TikTok. Children spend 25 % of their online phone time gaming or watching games (game time). They encounter many gambling and gambling-like activities while doing so. Of game time, 16% of the time children are exposed to marketing. Preliminary analysis reveals that children are exposed to marketing for alcohol, junk food, tobacco, vapes and gambling. This is counter to national legislation prohibiting or restricting such marketing to children.

Conclusions: This novel methodology reveals the actual online experiences of children as they go about their daily lives. This includes engaging in harmful behaviours such as gambling and encountering harmful product marketing. While from New Zealand, this study is likely to be relevant for other countries given the global reach of the online world. The research indicates the urgent need for national and global government regulation of the online world to protect the rights of children and ensure their wellbeing.

Key messages:

- Kids Online Aotearoa reveals the nature and extent of children's online world, including their exposure to harmful product marketing.
- National and global regulation of the online world is urgently needed to protect child rights and wellbeing.

Abstract citation ID: ckae144.384
The Impact of Portuguese Community Pharmacies on Influenza Vaccination Accessibility and Coverage

Sónia Romano

A Teixeira Rodrigues[1,2,3], *J Guerreiro*[1], *S Romano*[1], *S Moura*[4], *E Paulino*[5]
[1]Centre for Health Evaluation and Research, National Association of Pharmacies, Lisbon, Portugal
[2]Life and Health Sciences Research Institute, School of Medicine, Braga, Portugal
[3]ICVS/3B's-PT Government Associate Laboratory, Braga/Guimarães, Portugal
[4]Public Health Unit, Entre Douro e Vouga Health Local Unit, Santa Maria, Santa Maria da Feira, Portugal
[5]National Association of Pharmacies, Lisboa, Portugal
Contact: sonia.romano@anf.pt

Background: Vaccination reduces influenza infections. Non-adherence often stems from external barriers like distance to vaccination sites. To counteract the projected coverage decrease for 2023/24, Portugal's Government expanded free Influenza vaccination to those ≥ 60 and to community pharmacies (CP), enhancing proximity and availability. This study aimed to assess the impact of CP inclusion on the distance to vaccination sites and on Influenza vaccine coverage in the 2023/24 campaign.

Methods: Analytical study, evaluating the average distance (km) from population to the nearest vaccination site per municipality using GPS coordinates from National Health Service (NHS) sites and CP. The Global Human Settlement resident population grid was derived from Eurostat 2011 Census, Corine Land Cover Refined 2006 and European Settlement Map 2016. Scenarios with and without CP were compared. The difference (%) in distances between 2022/23 (NHS sites) and 2023/24 (NHS sites and CP) and the coverage for the top and bottom 10% of municipalities with the highest and lowest distance reductions were calculated.

Results: In the 2023/24 Influenza vaccination campaign, 844 NHS sites and 2487 CP participated. Excluding CP, the average distance to the nearest NHS site was 2.4 km, decreasing to 1.2 km with CP inclusion (-50.5%). As of March 31, 2024, influenza vaccine coverage for those aged $\geq$65 was 72.1%, decreasing 0.1 percentage points (pp) compared to 2022/23 (72.2%). For the top 10% municipalities with the highest distance reduction (up to 66.5%), coverage increased by 1.3 pp compared to 2022/23. Conversely, the bottom 10% (reduction under 10.3%) experienced a decrease of 4.5 pp.

Conclusions: The inclusion of pharmacies has effectively reduced access barriers, filled geographical gaps, and improved proximity to vaccination. This strategy appears to have a positive impact on influenza vaccination coverage, particularly amid growing hesitancy, with potential for broader public health strategies.

Key messages:

- The inclusion of community pharmacies in the 2023/24 Influenza vaccination campaign reduced the average distance to the nearest vaccination site by 50.5%, from 2.4 km to 1.2 km.
- In 2023/24, for the top 10% municipalities with the highest distance reduction (up to 66.5%), coverage increased 1.3 pp compared to 2022/23.

Abstract citation ID: ckae144.385
Exercise interventions for Long COVID: a systematic review of randomised controlled trials

Cillian McDowell

C McDowell[1], *B Tyner*[1], *S Shrestha*[1], *L McManus*[1], *F Comaskey*[1], *P Harrington*[1], *K Walsh*[1,2], *M O'Neill*[1], *M Ryan*[1,3]
[1]HIQA, Dublin, Ireland
[2]School of Pharmacy, University College Cork, Cork, Ireland
[3]Department of Pharmacology & Therapeutics, Trinity College Dublin, Dublin, Ireland
Contact: cmcdowell@hiqa.ie

Background: Long COVID is prevalent and costly. There is much debate around the effectiveness and tolerance of exercise among people with Long COVID due to the potential to exacerbate symptoms. Therefore, this systematic review aimed to examine the effectiveness and tolerance of exercise interventions among people with Long COVID as part of a wider project to inform updates to the Irish Health Service Executive's Long COVID interim model of care.

Methods: Medline via EBSCOhost, Embase, and CENTRAL were systematically searched on 28 February 2023. Inclusion criteria were: (1) participants with Long COVID; (2) random assignment to either an exercise intervention or a comparison group; (3) a quantitative measure of at least one of 12 core Long COVID outcomes. Two reviewers independently extracted data and assessed study risk of bias using the Cochrane Risk of Bias tool.

Results: In total, 4,394 studies were identified, 569 full texts were screened, and eight studies were included. Follow up periods ranged from two to 28 weeks (mean=8.5 weeks). Sample sizes ranged from 39 to 119 (mean=56). All studies were in adults (mean age=49.9 years) and both sexes (mean female proportion=53.9%). Four studies were at low risk of bias, two unclear, and two high. The evidence suggests that exercise interventions led to short-term improvements in dyspnoea, fatigue, physical function and the physical domain of quality of life. Of the five studies that reported adverse events, rates were low and, when reported, mild. Of the seven studies that reported sufficient information, one of 252 participants who received exercise discontinued the intervention due to tolerance-related issues.

Conclusions: Available evidence suggests that exercise interventions may have short-term benefits and be tolerable among some people with Long COVID. However, the evidence base consists of a limited number of studies with small sample sizes and short follow-up periods.

Key messages:

- There is much debate around the effectiveness and safety of exercise among people with Long COVID due to the potential to exacerbate symptoms.
- The available evidence suggests that appropriate exercise interventions may have short-term benefits and be tolerable. However, there are notable limitations among the evidence.

Abstract citation ID: ckae144.386
Effects of legal age change on adolescents' perception of access to alcohol in Portugal

Daniela Lima

D Lima[1,2], *T Leão*[2,3,4]
[1]Public Health Unit, Local Health Unit São João, Maia, Portugal
[2]EPIUnit, Instituto de Saúde Pública Universidade do Porto, Porto, Portugal
[3]ITR, Universidade do Porto, Porto, Portugal
[4]Departamento de Ciências da Saúde Pública e Forenses, Faculdade de Medicina, Universidade do Porto, Porto, Portugal
Contact: dani.dslima@gmail.com

Background: Adolescents and young adults are a group particularly vulnerable to the effects of alcohol consumption. In Portugal, legislative changes in 2013 and 2015 prohibited the sale of alcoholic beverages to under-18s. This study aimed, first, to evaluate the impact of these policy shifts on the perceived access to alcohol among Portuguese adolescents, and second, to assess the different impacts across gender and socioeconomic strata.

Methods: Data from the ESPAD survey, spanning 1995-2019, was used. A quasi-experimental difference-in-differences study design was employed, using Finland, Norway, and Sweden as controls. The perceived access to beer, wine, and spirits among 16-year-old adolescents was used as outcomes, adjusted for gender and parental education. Results were also stratified by gender and by parental education status.

Results: After the increase in the minimum age for alcohol sales, there was a higher perceived easiness of access to beer (coef=0.018, $p = 0.001$) and a decline in spirits (coef=-0.088, $p = 0.022$), with no changes in wine. Male adolescents exhibited a decrease in the perception of access to spirits (coef=-0.100, $p = 0.007$) and wine (coef=-0.049, $p = 0.049$), while changes in the perception of access to beer were non-significant. Similar patterns were observed in female adolescents, yet non-significant for wine or spirits. These positive impacts on beer and negative impacts on spirits were observed in the different socioeconomic groups; wine was the exception, with only the highest-education group showing a decrease in the perception of access (coef=-0.056, $p = 0.011$).

Conclusions: In this study, the effect of raising the minimum age for alcohol sales in Portugal varied according to the alcoholic beverage, gender, and, for wine, according to the socioeconomic group. These findings suggest limitations in the policy's effectiveness and equity. Future research should delve into the underlying causes to optimize health-promoting policies.

Key messages:

- Portugal's alcohol policy changes led to differential impacts on the perception of access to alcohol, with an impact in higher alcohol content beverages.
- The impact of alcohol policy changes also differed across gender and socioeconomic status, with a stronger effect on male adolescents and higher socioeconomic strata.

6.M. Scientific session: Risk And Resilience Factors Of Mental Health During COVID: European Multi-country Data Findings

Abstract citation ID: ckae144.387

Organised by: Vrije Universiteit Amsterdam (Netherlands)
Chair persons: Anke B Witteveen (Netherlands)
Contact: a.b.witteveen@vu.nl

The COVID-19 pandemic significantly affected mental health. It worsened the mental health and well-being of those already vulnerable or exposed to excess pandemic-related stress. In addition, lockdowns and other measures created additional obstacles to mental health support access. In response, the European Commission funded the RESPOND project in 2020, aimed at enhancing the preparedness of mental health systems for pandemics and global crises. As part of the RESPOND project, (meta-)analyses were conducted on prospective cohort datasets, national health register data, and multi-country individual participant data (IPD). The aim was to examine whether there was a change in prevalence rates of mental health conditions (e.g., anxiety and depression) in the general adult population of the EU during, compared to before and in between, the COVID-19 pandemic waves. Analyses on risk factors (e.g. socio-demographic- and economic factors, severity of COVID-19 infection, (lack of) social activity and support, and loneliness) associated with psychological distress and mental disorders as well as resilience and well-being (coping strategies and core value orientations) in the general population or specific vulnerable groups were conducted as well. This workshop will feature five talks covering various aspects of the RESPOND epidemiological analyses. First, an introduction and rationale of the RESPOND study on short- and long-term impacts of the COVID-19 pandemic and outbreak response, will be provided. Subsequently, findings from the multi-country longitudinal COvid MEntal healTh Survey (COMET) on forecasting psychological distress throughout the pandemic will be presented. Second, findings from the French TEMPO (Trajectoires EpideMiologiques en POpulation) cohort and merged datasets will be presented indicating associations and interactions between socioeconomic factors, mental health, and public health behaviours during the pandemic. Third, using data of a large Belgian prospective cohort, fluctuations in risk of psychological distress across study waves and the factors associated with individual trajectories of psychological distress during the COVID-19 pandemic will be presented. Fourth, the risk of SARS-CoV-2 infection, severe COVID-19 outcomes, and death among individuals with various mental disorders, based on Spanish health records, will be presented with specific attention to sex differences. Finally, based on the IPD meta-analyses of 9 European cohorts, findings on stressor reactivity, resilience trajectories, and factors associated with resilient outcomes and vulnerability are presented. By presenting a selection of findings from large datasets together, we aim to facilitate discussions on critical topics such as vulnerability and resilience to mitigate mental health impacts in future public health crises.

Key messages:

- Targeting specific individual vulnerabilities appears to be more effective in reducing the pandemics' mental health impact than solely responding to pandemic-related fluctuations.
- Research and harmonised data on vulnerability and resilience factors are essential for guiding the development of targeted interventions and support systems for vulnerable populations during crises.

Abstract citation ID: ckae144.388

Forecasting Psychological Distress Across Waves Of The COVID-19 Pandemic: A Multi-country Longitudinal Study

Anke B Witteveen

AB Witteveen[1], M Sijbrandij[1]
[1]Clinical, Neuro-, Developmental Psychology, Vrije Universiteit Amsterdam, Amsterdam, Netherlands
Contact: a.b.witteveen@vu.nl

The current study used a longitudinal multi-country cohort survey ($N = 8013$ at baseline; age (M) = 40.3, $SD = 15$; female 76%) to investigate whether psychological distress assessed at five waves (May-June 2020; September-October 2020; December 2020-January 2021; March-April 2021 and March-May 2022) during the COVID-19 outbreak can be forecasted by a variety of socio-demographic and psychological- and COVID-related factors assessed at baseline. Psychological distress was defined by elevated depression and/or anxiety scores (PHQ-9 and GAD-7 $>=$ 10). Predictors included demographic characteristics (e.g., gender, age, education), infections with COVID-19, loss of income, substance abuse, domestic violence, contamination fear, basic value orientations, social support and coping strategies. A Random Forest (RF) prediction model within a machine learning context was used to estimate the association between the independent variables and the presence of psychological distress among respondents completing all waves ($N = 1052$). Preliminary RF results showed that psychological distress at multiple waves, both during the initial phases (2020) as well as the more protracted phases (2021 and 2022), was adequately forecasted by scores on a number of basic value orientations (e.g., lower tradition and conformity, higher security and predictability), by demographic characteristics (e.g., younger age), by the fear of being contaminated, and by lower levels of social support and higher levels of loneliness. It is concluded that during a pandemic, certain personal values may elicit more vulnerability for psychological distress than others. Effective psychological intervention strategies should encompass personal traits and values and factors such as low social support levels and feelings of loneliness to mitigate distress. These insights can help in accurately pinpointing high-risk groups for heightened distress in future public health crises.

Abstract citation ID: ckae144.389

Socioeconomic And Mental Health Challenges: Lessons From The COVID-19 Era

Aurélia Roversi

M Melchior[1], I Hecker[1], A Roversi[1]
[1]INSERM, IPLESP, Sorbonne Université, Paris, France
Contact: aurelia.roversi@iplesp.upmc.fr

The relationship between work arrangements, financial difficulties, compliance with COVID-19 sanitary measures, and preexisting mental health issues amidst the ongoing pandemic is multifaceted. By merging data from the TEMPO cohort and other European cohort studies during the RESPOND European project, we seek to provide comprehensive about these dynamics for developing targeted interventions and policies aimed at mitigating the adverse impact of pandemics on mental well-being. Our analyses reveal significant associations between unemployment, financial strain, and elevated levels of symptoms of anxiety and depression during the

COVID-19 pandemic. Even after controlling for pre-pandemic socioeconomic and mental health factors, individuals experiencing unemployment or financial difficulties were more likely to report heightened mental distress. Additionally, our findings highlight gender-specific patterns in compliance with COVID-19 sanitary measures, with women exhibiting increased compliance amidst mental health difficulties, while men, particularly those with lower educational attainment, demonstrated decreased compliance. These preliminary results underscore the complex interplay between socioeconomic factors, mental health, and public health behaviours during pandemics. In conclusion, our study underscores the urgent need for targeted interventions and strategies to address the intersecting challenges of mental health, employment, financial strain, and compliance with public health measures during the COVID-19 pandemic. The findings emphasize the importance of considering socioeconomic disparities in designing effective interventions aimed at promoting public well-being and resilience in the face of future pandemics. By leveraging these insights, public health practitioners and policymakers can develop evidence-based approaches to support individuals and communities experiencing heightened vulnerabilities during times of crisis.

Abstract citation ID: ckae144.390

Psychological Distress Changes During COVID-19: A Belgian Cohort Study On Psychosocial Factors

Camille Duveau

C Duveau[1,2], *P Nicaise*[1], *P Smith*[1,2], *K Seeber*[1], *V Lorant*[1]
[1]Institute of Health and Society, Université Catholique de Louvain, Brussels, Belgium
[2]Sciensano, Epidemiology and Public Health, Brussels, Belgium
Contact: camille.duveau@uclouvain.be

Longitudinal studies have identified an increase in psychological distress across the general population during the COVID-19 pandemic. Nevertheless, the trajectories of mental health outcomes exhibit variations, suggesting potential associations with psychosocial individual factors. This paper identifies the factors of this individual trajectory of psychological distress during the COVID-19 pandemic. Five waves of a prospective cohort survey were conducted with a convenience sample of the general population in Belgium between March 2020 and November 2021 ($n = 4,550$). Psychological distress was measured using the GHQ-12. Individual covariates included socioeconomic factors (age, gender, level of education), psychological factors (loneliness, social support, and social activities), and factors related to the virus and the lockdown measures (exposure to COVID-19 and survey wave). Multilevel models were used for analysis. Women and young people experienced more pronounced fluctuations in their risk of psychological distress across study waves, experiencing both increases and decreases. We found that individual variance in psychological distress breaks down into two components, respectively 43% for psychosocial factors (time-invariant) and 57% for the survey waves (time-variant) variation. A significant share of the time-invariant difference in psychological distress over COVID-19 is associated with loneliness, social support, and social activities. Loneliness emerged as the most important interpersonal factor associated with psychological distress. The change in psychological distress was mainly associated with psychosocial factors rather than with pandemic-related dynamics (e.g. survey waves). These findings suggest that mitigation policies aiming at controlling the pandemic should focus more on addressing specific individual vulnerabilities rather than solely responding to the fluctuations within pandemic waves to decrease their detrimental impact on mental health.

SARS-CoV-2 Infection And COVID-19 Outcomes Among Mental Disorders: A Register-based Study in Catalonia

Iago Giné-Vázquez

JM Haro[1], *I Giné-Vázquez*[1]
[1]Parc Sanitari Sant Joan de Déu, Fundació Sant Joan de Déu, Universitat de Bar, Barcelona, Spain
Contact: iago.gine@sjd.es

This study aimed to study the risk of SARS-CoV-2 infection and severe COVID-19 outcomes across different mental diagnoses and to assess the role of sex in these associations. We used electronic health records from Catalonia to identify adults receiving inpatient/outpatient mental health care between 2017-2019 with diagnosis of non-affective psychosis (NAP), bipolar disorder (BD), depressive disorder (DEP), stress-related disorders, neurotic/somatoform disorders (NSD), and substance misuse (SUB) (exposed). Outcomes included SARS-CoV-2 infection, COVID-19 hospitalization, and COVID-19-related death. Adjusted logistic regression analyses were conducted. 785,378 adults were included (70.3% $<$ 65 years old; 57.1% women). Compared to unexposed, those with NAP [OR (95%CI): 0.84 (0.80-0.88)], BD [0.80 (0.75-0.86)], DEP [0.97 (0.94-1.00)] and SUB [0.81 (0.78-0.84)] had a lower risk of SARS-CoV-2 infection, while people with NSD presented an increased risk [1.03 (1.01-1.06)]. Among those infected, people with DEP, NSD, and SUB had a lower risk of COVID-19 hospitalization, but higher risk of COVID-19-related death [1.23 (1.07-1.41); 1.26 (1.07-1.48); 1.48 (1.24-1.71), respectively]. A higher COVID-19-related death was also found in people with NAP and BD [1.68 (1.34-2.12); 2.02 (1.50-2.73)]. Sex-stratified analysis showed that women with NSD were especially vulnerable to infection [1.07 (1.03-1.11)], and women with DEP and NSD to COVID-19-related death [1.24 (1.05-1.47); 1.26 (1.02-1.54)]. These results suggest different vulnerabilities to infection and COVID-19 hospitalization and death across mental disorders. These findings have implications for pandemic preparedness, highlighting the need for specific public health strategies to mitigate the excess of mortality of people with certain mental disorders.

Abstract citation ID: ckae144.392

Stress Resilience And Resilience Factors Across 9 European Samples During The COVID-19 Pandemic

Papoula Petri-Romão

P Petri-Romão[1], *R Kalisch*[1]
[1]Leibniz Institute of Resilience Research, Mainz, Germany
Contact: papoula.petri-romao@lir-mainz.de

While many describe changes in mental health over the pandemic, we investigate change in resilience over time during the pandemic. Stress resilience can be operationalised as stressor reactivity, that is, how much a person's mental health is affected by the stressors that they experience. Utilising the individual participant data (IPD) meta-analyses megadataset available we first define and quantify how many stressors individuals. We then regress this stressor exposure on mental health within each sample to compute each sample's normative stressor reactivity. Each person's individual stressor reactivity is then calculated as the residual to this line at each time points. Resilient outcomes can be understood as lower reactivity as this indicates lower susceptibility to stressors. Stressor reactivity (SR) scores control for individual stressor exposure, therefore allowing us to investigate resilience factors during a time in which exposure to macro and micro stressors varied greatly between individuals. Further, SR scores are a harmonised outcome that can easily compared across different samples in the IPD dataset. Using this outcome, we present findings on resilience trajectories and identify factors that are associated with resilient outcomes. We also disentangle the role of current stressor exposure and prior stressors, showing that prior exposure to stressors increases vulnerability in subsequent exposures. Our findings show that stressor reactivity over time was more stable than mental health symptoms during the pandemic, therefore indicating that SR as an outcome offers new insights into the impact of the pandemic.

The association between electronic media use and quality of life (QoL) in Norwegian adolescents

Annette Løvheim Kleppang

AL Kleppang[1], TH Stea[2], T Bonsaksen[1], M Leonhardt[3], L Lien[1], AM Steigen[1]
[1]Innland Norway University of Applied Sciences, Elverum, Norway
[2]University of Agder, Kristiansand, Norway
[3]VIDSpecialized University, Oslo, Norway
Contact: annette.kleppang@inn.no

Background: The use of screens, especially mobile devices like tablets and smartphones have increased over the last years and have become an integrated part of modern life. Adolescents today spend a lot of their time using screens both at school and outside school. Identifying how screen use are related to QoL is necessary to plan effective policies and interventions in adolescence since it is the period where different behaviours are adopted. The purpose of this study is to examine the association between electronic media use and quality of life (QoL) among adolescents.
Methods: This study was based on self-reported cross-sectional data from the Young-Hunt4 study, conducted in 2017-2019. The target group comprised 8066 13-19 years old adolescents. QoL was measured with the Norwegian version of the Inventory of Life Quality (ILC). The ILC scale consists of seven items with four response alternatives. Electronic media use was measured using the two variables Social media use and Gaming. Multiple linear regression was used to analyse the association between gaming, social media use and QoL.
Results: Preliminary results showed an inverse association between gaming (>3 hours per day) after school and quality of life (β: -.07, $p < 0.001$) and social media use (>3 hours per day) after school and quality of life ($\beta = -.06$, $p < 0.001$). Similar inverse associations were observed between gaming (>3 hours per day) in the weekend and quality of life (β: -.09, $p < 0.001$) and social media use (>3 hours per day) in the weekend and quality of life ($\beta = -.04$, $p = 0.002$). These associations remained significant after controlling for gender, age, family economy, psychological distress and having friends.
Conclusions: More than three hours on screens per day after school was negatively associated with QoL. Hence, public health policy and practice should pay attention to consequences of screen time use in adolescence. Additional research is needed to further explore these associations.
Key messages:
- More frequent use of electronic media is negatively associated with QoL.
- Public health policy and practice should pay attention to screen time in adolescence and its association with QoL.

Abstract citation ID: ckae144.394
Adolescents witnessing family violence and its association with socio-economic factors

Sanna Tiikkaja

S Tiikkaja[1,2], Y Tindberg[2,3], N Durbeej[1]
[1]CHAP, Department of Public Health and Caring, Uppsala University, Uppsala, Sweden
[2]Centre for Clinical Research, Uppsala University, Eskilstuna, Sweden
[3]Department of Women's and Children's Health, Uppsala University, Uppsala, Sweden
Contact: sanna.tiikkaja@fou.sormland.se

Background: About 200 000 children in Sweden live in families where violence among adults occurs. About 10% of children have witnessed violence family violence Family violence is often more prevalent in low social status families. The present study describes adolescents that have witnessed threats of violence, abusive words or physical/sexual violence in their families, as well as the association between these types of violence and socio-economic factors.
Methods: Data from a school-based survey, in the County of Sörmland (2023), including 15-18-years-old students in 2023 were used. Witnessing family violence was measured by the following item "Have you experienced that an adult in your family has... 1) threatened to use violence against someone else in your family? 2) used abusive words, oppression, or been dominant or controlling against someone else in your family? 3) used physical violence against someone else in your family, such as hitting, pushing, kicking, or sexual violence". Parental work status, the child's living conditions and economic stress were used as socio-economic factors. Data were analysed by descriptive methods and logistic regressions.
Results: This study included 3 407 adolescents among which 19% had witnessed any type of family violence. The most prevalent type was witnessing abusive words, (17%), followed by physical/sexual violence (10%) and threats to use violence (9%). Witnessing any type of family violence was associated with all socio-economic variables in univariate analyses, the strongest association was found for having economic stress ($OR = 3.30$; 95% CI 2.72-4.01), in comparison to not having economic stress. Further adjustments for gender, grade, ethnicity, parental work status and living with both parents attenuated the association, $OR = 2.50$ (95% CI 2.03-2.07).
Conclusions: Two of ten adolescents have witnessed any type of family violence. These adolescents often belonged to families with low socioeconomic status making them vulnerable.
Key messages:
- In this school-based study, 19 % of adolescents had witnessed any type family violence. Having witnessed abusive words was the most prevalent type of family violence.
- There is as strong association between witnessing family violence hand having economic stress among adolescents. These adolescents need to be noticed in their particularly vulnerable situation.

Abstract citation ID: ckae144.395
Impact of loneliness and social support on leisure physical activity in adolescents in Luxembourg

Joana Lopes Ferreira

J Lopes Ferreira[1], FG Mendes[1], C Catunda[1]
[1]Department of Social Sciences, University of Luxembourg, Esch-sur-Alzette, Luxembourg
Contact: joana.lopesferreira@uni.lu

Background: Healthy lifestyle includes a regular practice of vigorous physical activity in adolescents' leisure time. Engaging in physical activity (PA) depends on individual, social and environmental factors. Previous literature has showed that social support and loneliness can influence the practice of PA. The study aims to analyse the relation between PA during leisure time and social support and loneliness among adolescents in Luxembourg.

Methods: The study includes 7049 adolescents from the Health Behaviours in School-aged Children (HBSC) Luxembourg 2022 survey. PA in leisure time was categorised according to WHO recommendations for vigorous physical activity. Perceived social support (friends, family, teacher, and classmate) was dichotomised in high support and in low/medium and loneliness in feel often lonely and not feel often lonely. It was executed a binomial logistic regression to analyse the PA levels in leisure time by loneliness and social support, controlling by age, migration background, perceived wealth, and family structure, split by gender.

Results: In Luxembourg, boys who perceived high support from most of the sources and didn't feel often lonely had higher chances to reach WHO recommendations for PA during leisure time (e.g. loneliness: OR = 1.38, CI95%[1.11-1.74]; family support: OR = 1.31, CI 95%[1.10-1.56]), except for teacher support (OR = 0.79, CI95% [0.67-0.93]). In contrast, girls who only perceived high support from classmates (OR = 1.21, CI95%[1.05-1.4]) and teachers (OR = 1.19, CI95%[1.01-1.38]) had higher chances to be physically active.

Conclusions: This is the first study to investigate the impact of social support and loneliness among adolescents in Luxembourg. Future research should investigate social-related barriers and facilitators of PA during leisure time.

Key messages:

- Understanding adolescents social support can guide towards effective strategies that promote physical activity during leisure time.
- Boys benefit from several social support sources, while girls thrive with encouragement from classmates and teachers to stay physically active in leisure time.

Abstract citation ID: ckae144.396
Association of healthy lifestyle on overweight and obesity among adolescents in Luxembourg

Felipe G Mendes

FG Mendes[1], *J Lopes Ferreira*[1], *C Catunda*[1]
[1]Department of Social Sciences, University of Luxembourg, Esch-sur-Alzette, Luxembourg
Contact: felipe.goedertmendes@uni.lu

Background: Adolescent overweight and obesity are significant public health challenges. Understanding the impact of healthy lifestyle behaviours is crucial for effective intervention strategies. The aim of this study is to analyse the association between healthy lifestyle behaviours with overweight and obesity among adolescents in Luxembourg.

Methods: The study was based on the HBSC Luxembourg 2022 survey and includes 8415 adolescents aged 11 to 18 years. Adolescents self-reported the frequency of fruit and vegetable consumption, physical activity, height, and body mass. Eating and physical activity behaviours were categorized based on WHO recommendations. Body Mass Index categorization followed International Obesity Task Force criteria. Binomial logistic regression of obesity and overweight with the interaction between healthy diet and physical activity was performed, controlling for age, gender, family affluence, migration background, and family structure.

Results: The results indicated a significant protective effect of healthy lifestyle behaviours against overweight and obesity. For overweight, adolescents engaging in either fruit and vegetable consumption (OR = 0.829, 95% CI [0.697-0.986]) or physical activity (OR = 0.719, 95% CI [0.566-0.913]) showed reduced odds compared to those with unhealthy behaviours. For obesity, similar associations were observed. Adolescents engaging in physical activity (OR = 0.407, 95% CI [0.235-0.705]) showed reduced odds compared to those with unhealthy behaviours. Combining both behaviours resulted in the lowest risk of obesity (OR = 0.366, 95% CI [0.177-0.760]) and overweight (OR = 0.473, 95% CI [0.340-0.658]).

Conclusions: Promoting health eating and physical activity behaviours are important strategies for preventing overweight and obesity in youth in Luxembourg. Implementing targeted interventions aimed to promote these behaviours could mitigate the burden of overweight and obesity in this population.

Key messages:

- Healthy lifestyle matters: Fruit and vegetables consumption or regular physical activity significantly reduce the risk of overweight and obesity among adolescents.
- Combining behaviours counts: Concurrent engagement in both fruit and vegetables consumption and physical activity offers the greatest protection against overweight and obesity.

Tradition to Concern: Health Risks and Nicotine Dependence of Midwakh Use in Young Males in the UAE

Basema Saddik

B Saddik[1,2,3], *M AlHajjaj*[1], *M AlHouqani*[4], *R Halwani*[1,2], *B Mahboub*[1], *R Zeidan*[2], *M AlHammadi*[1], *A Shukla*[2], *A Seif*[1], *F Saheb Sharif-Askari*[2]
[1]College of Medicine, University of Sharjah, Sharjah, UAE
[2]RIMHS, University of Sharjah, Sharjah, UAE
[3]School of Population Health, University of New South Wales, Sydney, Australia
[4]College of Medicine, United Arab Emirates University, Al-Ain Abu Dhabi, UAE
Contact: bsaddik@sharjah.ac.ae

Background: Midwakh smoking, a traditional practice, poses a growing public health concern in the Middle East region. Despite global efforts to curb tobacco use, smoking rates, particularly among young men, remain high. This study explores nicotine dependency, assesses acute health effects, and measures carbon monoxide levels among midwakh smokers.

Methods: A quasi-experimental before-and-after study involved 103 young male midwakh smokers in the UAE. Data collection included surveys featuring the Hooked-on Nicotine checklist (HONC), clinical measurements, and pre/post-smoking saliva samples. Statistical analyses, including descriptive, paired samples, correlation, and regression, assessed associations between midwakh smoking, dependency, and health outcomes.

Results: Preliminary findings found that 33% of midwakh smokers were under 21 years, 68% had below undergrad education, and household incomes over 15,000 AED monthly. Smoking initiation was as early as 10 years. Smoking habits revealed 37% exclusive midwakh, 54% midwakh with e-cigarettes, 21% with shisha, and 34% with cigarettes. Post-smoking clinical measurements showed significant increases in blood pressure, heart, pulse and respiratory rates, and carbon monoxide levels ($p \leq 0.05$). Significant differences in pre- (134.6 ng/ml) and post-smoking (154.4 ng/ml) saliva cotinine levels ($p \leq 0.05$) were observed. Regression analysis identified predictors of nicotine dependency: initiation age (β= -.315; -0.579,0.0512), household income ($\beta = 1.221$; 0.297,2.146), multiple tobacco use ($\beta = 0.576$; 0.129,1.024), quit attempts ($\beta = 1.555$; 0.519,2.590) and smoking risk perception ($\beta = 3.420$; 1.950,4.890)

Conclusions: Midwakh smoking adversely affects clinical measurements, with early start correlating with higher nicotine dependency, worsened by using multiple tobacco products. Urgent action is needed, including tailored prevention campaigns and support systems to aid youth cessation and raise awareness of midwakh smoking's harmful effects.

Key messages:

- Midwakh smoking is deeply ingrained in UAE tradition but poses significant adverse health outcomes and nicotine dependency.
- There is a need to establish specialized cessation programs offering support and resources to midwakh users, addressing both the health consequences and addictive nature of midwakh.

Abstract citation ID: ckae144.398
Early life social predictors of longitudinal relations between childhood BMI and overeating

Anna Bartoskova Polcrova

A Bartoskova Polcrova[1]*, G Ksinan Jiskrova*[1]*, M Bobak*[1,2]*,*
H Pikhart[1,2]*, AJ Ksinan*[1]
[1]RECETOX, Masaryk University, Brno, Czechia
[2]Department of Epidemiology and Public Health, University College London, London, UK
Contact: anna.bartoskova@recetox.muni.cz

Introduction: The progression of obesity is a continuous process involving a complex system of genetic, environmental, and behavioural factors. Socioeconomic disadvantage as well as psychological distress may lead to overeating, subsequently associated with increased energy intake and weight gain. Recent evidence indicated that the association between childhood obesity and overeating might be bidirectional. Therefore, this study aimed to longitudinally investigate the directionality of the association between childhood BMI and overeating and to identify antecedent early childhood predictors.

Methods: The study sample included 5,777 children from the European Longitudinal Study of Parents and Children (ELSPAC), collected between 18 months and 11 years of child age. The outcomes were child BMI and overeating. Predictors included maternal BMI, maternal education, single-parent households, financial difficulties, and adverse childhood experiences (ACEs). The random intercept cross-lagged panel model (RI-CLPM) was applied.

Results: The results showed temporal stability in the development of overeating and BMI, with a bidirectional relationship that strengthened over time. The child's BMI was predicted by maternal BMI ($\beta = 0.37$, $p < 0.001$). The child's overeating was predicted by maternal BMI ($\beta = 0.13$, $p < 0.001$), but a stronger effect was found for ACEs ($\beta = 0.24$, $p < 0.001$). ACEs mediated the impact of maternal education, financial difficulties, and single parenthood on overeating with indirect effects of $\beta = -0.01$ ($p = 0.005$), $\beta = 0.04$, ($p < 0.001$), and $\beta = 0.07$ ($p < 0.001$), respectively.

Conclusions: We observed stable bidirectional longitudinal effects, with a stronger association from BMI to overeating. The results suggested two main pathways: one linked to maternal BMI and early childhood BMI increase followed by overeating, and the other associated with ACEs mediating the effect of early childhood socioeconomic factors on overeating, leading to gradual BMI gain. #NGEU

Key messages:

- The study revealed a stable bidirectional association between childhood BMI and overeating, with a stronger association from BMI to overeating.
- There are two potential pathways in childhood obesity development, one involving maternal BMI, and the second associated with social disadvantage and ACEs.

6.O. Scientific session: The unmet needs of LGBTQ+ persons and communities: perspectives from across the globe

Abstract citation ID: ckae144.399

Organised by: EUPHA-SGMH, -GH
Chair persons: Kristefer Stojanovski (USA), Elena Petelos (EUPHA-HTA, EUPHA-GH)
Contact: kstojanovski@tulane.edu

Lesbian, gay, bisexual, transgender and queer persons suffer from rising anti-LGBTQ+ stigma. Such stigma entails laws that punish being LGBTQ+ such as in Uganda, Russia, Ghana, Iran, etc. The stigmatizing contexts have numerous health-harming effects, including perpetrating mental health harms and creating environments that hamper access & quality of services. Rising global anti-LGBTQ+ stigma and the adverse health impacts require more data on the topic to adequately dispel LGBTQ+ mis- and dis-information. This workshop will give examples of studies that examine LGBTQ+ disparities and inequities in health across different social and cultural contexts, drawing from research in Czechia, Kenya, Rwanda, and Sweden. The workshop will first outline the relevant social and cultural contexts of LGBTQ+ persons in various countries, such as attitudes, beliefs, and values. The workshop will then discuss LGBTQ+ inequities and disparities that arise from health-harming attitudes, beliefs, and values. Afterward, the workshop will discuss public health-oriented solutions & policy directions, including using data for interpretation and advocacy labs and efforts, enhancing data collection, improving knowledge and attitudes, and other implications for public health practice and policy. The workshop will open a session that will situate LGBTQ+ public health for the audience. The first study will be by Andreas Malm from the Karolinska Institute, Sweden, examining LGBTQ+ differences in mental health and treatment disparities in Sweden. This will be followed by Luis Roxo from the Karolinska Institute and Universidade NOVA de Lisboa, Portugal, discussing stressors and symptoms that shape inequalities in mental health service use. Then, Michal Pitonák from the National Institute of Mental Health, Czechia, will present treatment and outcome gaps in the mental health of LGBTQ+ persons in Czechia. Lastly, Emmy Kageha Igonya from the African Population Health Research Center, Kenya, will showcase work from a mixed-methods study with LGBTQ+ people in Rwanda and Kenya, examining access to and use of healthcare services. After the individual presentations, which will each last 7-8 minutes, the audience will be invited to a moderated 20-25-minute open discussion on the papers & how the findings can help inform public health practice & policy to address the unmet needs of LGBTQ+ populations globally. The continuing rise in anti-LGBTQ+ sentiments across the globe is problematic from a public health standpoint, given the severe health-harming effects across numerous physical and mental health states and domains. Our workshop aims to facilitate a conversation on understanding the structural situations that shape LGBTQ+ health and identifying strategies to reduce gaps in services and needs that disproportionately burden LGBTQ+ persons.

Key messages:

- LGBTQ+ people across the globe are experiencing rising stigma and discrimination.
- Rising anti-LGBTQ+ backlash disproportionately harms LGBTQ+ physical and mental health and creates gaps in care.

Abstract citation ID: ckae144.400
Mental health symptoms and treatment for common mental disorders among sexual minority immigrants in Sweden – a national population-based study

Andreas Malm

P Tinghög[1,2], *R Bränström*[1], *A Malm*[1]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Department of Health Sciences, Swedish Red Cross University, Huddinge, Sweden
Contact: andreas.malm@ki.se

Background: Although sexual minorities are at greater risk of poor mental health, less is known about mental health among dual minority statuses individuals based on sexual orientation and migration status. The current study investigated disparities in mental health symptoms and psychiatric treatment for common mental disorders among Swedish-born and immigrant heterosexuals and sexual minorities. It further explored the role played by interpersonal and social stress in explaining these disparities.

Methods: Participants (n = 104,652) were drawn from the Swedish Public Health Survey in 2018. Six groups were compared based on sexual orientation (heterosexual, sexual minority) and migration status (Swedish-born, European-born, non-European). The survey was complemented with information on psychiatric treatment from nationwide registries. Odds ratios were calculated using logistic regression.

Results: Compared to Swedish-born heterosexuals, Swedish-born and non-European sexual minorities had the greatest risk of mental health symptoms (odds ratios [OR]=2.20, 95% confidence intervals [CI]: 1.89-2.57, and OR = 2.10, 95% CI 1.34-3.29, respectively). Swedish-born sexual minorities had greater risk of psychiatric treatment (OR = 2.58, 95% CI 2.20-3.01), while non-European heterosexuals had lower risk (OR = 0.61, 95% CI 0.52-0.72). No differences in psychiatric treatment was found for non-European sexual minorities (OR = 0.82, 95% CI 0.46-1.48). Interpersonal and social stress factors mediated the associations between migration status and mental health symptoms and psychiatric treatment differently depending on sexual orientation.

Conclusions: No excess risk of mental health symptoms was found among sexual minority immigrants compared to their Swedish-born counterparts.

Key message:

- Non-European sexual minority immigrants' risk of mental health symptoms was equally high to the risk among Swedish-born sexual minorities, but they received less psychiatric treatment.

Abstract citation ID: ckae144.401
Stressors and symptoms explaining sexual orientation inequalities in mental health services usage: A longitudinal study with young adults

Luis Roxo

J Pachankis[3], *R Bränström*[1], *L Roxo*[1,2]
[1]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
[2]Comprehensive Health Research Centre, Universidade NOVA de Lisboa, Lisbon, Portugal
[3]Department of Social and Behavioral Sciences, Yale University, New Haven, USA
Contact: luis.roxo@ki.se

Background: Sexual minority (i.e., lesbian, gay, and bisexual [LGB], and other non-heterosexual) individuals are more likely to use mental health services than heterosexuals; however, evidence is scarce about factors contributing to this difference.

Methods: This study uses longitudinal data from a population-based sample of young adults (aged 18- 36) in Sweden (N = 1,137). We use mediation analysis to examine whether common mental health symptoms (i.e., depressive, anxiety and social anxiety symptoms, suicidality, and alcohol use) mediate sexual orientation differences in mental health services use; and to understand whether adding general stressors (i.e., low social support, loneliness, and perceived stress) to these models increases the total effect explained. Afterwards, we use logistic regression models to understand how minority-specific stressors (e.g., family reaction and dimensions of sexual minority identity) predict mental health service use among sexual minority individuals (N = 498), adjusting for common mental health symptoms.

Results: Common mental health symptoms only partially mediate the associations and the direct effect for sexual orientation remain significant ($\beta = 0.11$, $p < 0.01$). Adding general stressors to these models only slightly increase the total effect explained and the direct effect remained significant ($\beta = 0.11$, $p < 0.01$). Among sexual minority individuals, after adjusting for common mental health symptoms, a difficult process of coming out ($\beta = 0.12$, $p < 0.05$) and negative family reaction towards one's sexual orientation ($\beta = 0.15$, $p < 0.05$) predicted use of mental health services.

Conclusions: Overall, these results show that minority-specific stressors contribute to help-seeking behaviours among sexual minority individuals, regardless of psychiatric morbidity, highlighting the potential role of mental health services empowering sexual minority individuals to cope with minority stress.

Contact: michal.pitonak@nudz.cz

Aims: This study aims to (1) estimate the prevalence and relative risk of mental disorders, (2) assess the severity of mental health symptoms, and (3) investigate the treatment gap for mental disorders within SM.

Methods: Data from a cross-sectional, nationally representative survey of 3,063 Czech adults (response rate = 58.6%) were utilized. The Mini-International Neuropsychiatric Interview was employed to screen for mental disorders. In those identified with mental disorders, help-seeking behaviors over the past 12 months were examined. The severity of mental health symptoms was evaluated using the 9-item Patient Health Questionnaire and the 7-item Generalized Anxiety Disorder scale. Prevalence rates of mental disorders associated treatment gaps, and relative risks of mental disorders were calculated.

Results: The prevalence of mental disorders among heterosexual, gay or lesbian, bisexual, and more sexually diverse individuals was 18.9% (17.4-20.3), 52.3% (36.9-67.6), 33.3% (19.5-47.2), and 25.9% (13.9-38), respectively. Suicidal thoughts and behaviors were reported in 5.7% (4.9-6.6) of heterosexual individuals compared with 25.0% (11.7-38.3) in gay or lesbian, 22.9% (10.6-35.3) in bisexual, and 11.1% (2.5-19.8) in more sexually diverse individuals. After adjusting for confounders, gay or lesbian individuals demonstrated an increased risk of having at least one current mental disorder compared with heterosexual people (OR = 3.5 95% CI(1.8-6.8)).

Bisexual and more sexually diverse individuals demonstrated risks consistent with a null effect. No substantial differences in treatment gap were detected between heterosexuals and SM who scored positively for at least one current mental disorder.

Conclusions: The findings underscore the urgent need for systemic changes to improve the mental health outcomes of Czech SM. Addressing structural stigma and ensuring sensitive care are imperative to mitigate the health disparities faced by Czech SM.

Background: Lesbian, gay, bisexual men, and transgender persons (LGBT) in Kenya and Rwanda have a hard time accessing healthcare, in particular sexual health screening. We used a social norms and values framework to examine determinants of access to healthcare, with specific attention to sexual healthcare.

Methods: We draw on cross-sectional mixed methods research in Kenya and Rwanda that examined the lived experiences of sexual and gender minorities in access to health services. A cross-sectional quantitative survey in Rwanda ($n = 499$) and Kenya ($n = 1,550$) was conducted with LGBT people. We conducted key informant interviews ($n = 81$), in-depth interviews ($n = 48$), digital storytelling ($n = 3$), and focus group discussions ($n = 30$). We used a mixed-methods thematic and content analysis to integrate quantitative and qualitative findings.

Findings: Accessibility and quality of care were the main barriers to healthcare services. The results indicate widespread discrimination and stigma toward LGBT people in service provision. Approximately half of the survey participants, 47%, reported challenges accessing health services, and 25% indicated they experienced discrimination in healthcare. Qualitative results link low quality of care to stigma and discrimination. "Mostly at the hospitals, there are times people take too much time discussing who we are instead of giving us the treatment we seek, and send us to mental health to first deal with our sexuality issues since they think it is a 'sickness.'" (Focus group, Muhanga, Rwanda). Our study highlights challenges in navigating sexual healthcare in government, faith-based, and donor-funded health facilities.

Conclusions: Access to healthcare services, particularly sexual health screening and prevention, is a growing issue for LGBT people in Kenya and Rwanda. Stigma acts as a significant barrier to high-quality healthcare. Sensitivity training and educational opportunities for healthcare professionals are urgently needed to address stigma.

6.P. Scientific session: Economic evaluation of health impacts for better decision choices

Abstract citation ID: ckae144.404

Organised by: EUPHA-HIA, -FS, -ECO, -PHPP, University of Bath (UK), RIVM (Netherlands)
Chair persons: Piedad Martin-Olmedo (EUPHA-HIA), Henk Hilderink (EUPHA-FS)
Contact: piedad.martin.easp@juntadeandalucia.es

The strategy of Health in All Policies (HiAP) pursues to analyse the wider determinants of health affected by the decision-making process of traditionally non-health sectors, seeking to enhance population health benefits while avoiding health inequalities. This usually involves the use of health impact assessment (HIA) or health lens analysis to any policy, program, plan or project (PPPP), preferably prior to its implementation. On the other hand, decision-makers from a wide range of public and private sectors also demand a better insight of the meaning of the health impacts quantified under HIA. Assuming the (ubiquitous) situation of limited resources and budgets, decisions need to be based on cost effectiveness criteria and, whenever possible, direct and indirect health costs should be part of the impact assessment. Economic appraisal attempts to define whether a proposal makes a net contribution to social welfare, quantifying and valuing changes to individuals' utility from the societal perspective, taking into account the impact of health on the individual, their family, employers, healthcare providers and the state. This approach can incorporate different components of the welfare costs of illness, including direct medical and paid care expenses, indirect lost opportunity costs such as productivity and the value of informal care time, as well as a value that monetises the disutility or pain and suffering associated with disease. The range of methods and estimated benefits can make it challenging to identify a best practice approach.

The present session aims to address certain methodological aspects related to the economic evaluation of health impacts, which still generate some controversy and debate, with particular emphasis on the following topics: • Approaches for synthesizing evidence on health impact pathways and economic evaluation of health impacts for a better decision choice; • Health metrics: influence on the conclusions of economic analysis within HIA; • Sources of metrics used for economic analysis; • Uncertainties inherent to economic valuation of health outcomes: how to deal with it.

Key messages:

- The economic analysis of health impacts can help prioritizing aspects with the greatest impact on population health, facilitating a more effective use of human and economic resources.
- The economic analysis within HIA can improve decision-making but requires careful consideration of health metrics, sourcing of data, and management of uncertainties.

Abstract citation ID: ckae144.405

Cost-benefit analysis: just a step in the HIA process

João Vasco Santos

J Santos[1,2]
[1]EUPHA-ECO
[2]Faculty of Medicine, University of Oporto, Oporto, Portugal
Contact: jvasco.santos@gmail.com

The economic analysis within Health Impact Assessments (HIA) is a critical component in informing public policy decisions by assessing the financial implications of health outcomes associated with the different intervention options. Health metrics play a role defining the cost-effectiveness and societal value associated with the interventions. These metrics, quantifying the health impacts, include quality-adjusted life years (QALYs), years of life lost (YLLs) or disability-adjusted life years (DALYs). On another level, such metrics need to be translated into cost-effectiveness and societal value in which other methods play a role, such as the value of statistical life (VSL) or the value of a life year (VOLY). While VSL quantifies the value individuals place on reducing mortality risk, VOLY evaluates the value attributed to extending life expectancy. On another hand, uncertainties related to economic valuation pose challenges to the accuracy and reliability of cost estimates within HIA. These come from several factors, including data quality, methodological differences across studies, and subjective judgments involved in valuing health states. In fact, estimating the economic value of a prevented death involves multifaceted considerations and important assumptions. Additionally, assigning monetary values to non-fatal health outcomes, such as disability or reduced quality of life, involves subjective assessments and value judgments. By selecting appropriate metrics, considering diverse data sources, and addressing methodological steps and uncertainties, HIA practitioners can improve the utility of economic assessments, facilitating evidence-based decision-making in public health policy and resource allocation. This work was supported by National Funds through FCT - Fundação para a Ciência e a Tecnologia,I.P., within CINTESIS, R&D Unit (reference UIDP/4255/2020).

Social Cost Benefit Analysis – a powerful tool for decision making

Ardine De Wit

A De Wit[1,2], *E Over*[1]
[1]Centre for Public Health, RIVM, Bilthoven, Netherlands
[2]Department of Health Sciences, Beta Faculty, University Amsterdam, Amsterdam, Netherlands
Contact: Ardine.de.wit@rivm.nl

Health Impact Assessment provides policy makers with important information about health effects of programs, policies, plans or projects (PPPP). However, PPPP may have many more effects, both positive and negative, direct and indirect, intended and unintended, immediate and in the far future. Ex-ante insights in all these effects may help policy makers to optimize decision-making, but also to communicate realistically to all stakeholders about the PPPP. Weighing effects that may be very different in scale and reach different stakeholders in different ways is inevitable. One powerful tool to help decision makers in this task is Social Cost Benefit Analysis (SCBA). SCBA requires to specify and quantify all effects of PPPP over a specified time horizon. It is also necessary to specify a base-case scenario, i.e. how the problem under study would develop without further investments in PPPP. All effects of PPPP need to be quantified in monetary terms, these can be financial, e.g. healthcare costs or costs of productivity losses, or non-financial, for instance by placing a value of €50,000 on a QALY gained or a DALY averted or a value of €3,5 million on a lost life. PPPP with positive net monetary value are considered welfare enhancing, while PPPP with a negative monetary value do not add to welfare in society. In the Netherlands, government asks any bigger PPPP to be quantified with SCBA methodology. Guidance on unit values for non-monetary effects is given. This contribution will elaborate on results of the SCBA method for different alcohol policy measures, such as increase in excise taxes, minimum unit pricing, closure of vending spots and a total marketing ban. SCBA is a powerful tool to inform policy makers and assist in their decision making processes. It is also a labour and data intensive process that should only be used for larger PPPP investments and not for local decision making.

Informing healthy urban policy making through quantitative health impact appraisal – a co-designed approach

Alistair Hunt

A Hunt[1], *E Eaton*[1]
[1]Environmental Economics, University of Bath, Bath, UK
Contact: ecsasph@bath.ac.uk

Quantitative health impact appraisal for land use development is currently challenging. We show how a co-designed process between urban decision makers and academics can help to improve ways of deriving evidence for creating healthier cities. The Health Appraisal of Urban Systems (HAUS) economic valuation model was developed with local partners to inform a strategic framework for a UK urban regeneration site. HAUS is a comparative risk assessment model which allows the user to understand mechanisms for change through applying an impact-pathway approach to quantify changes in health. It is informed by systematic reviews of epidemiology and societal costs of 85 individual health end-points. Scenarios combined a range of characteristics including air and noise pollution, green space, crime, walkability, food environment and transport. Health outcomes include morbidity and mortality impacts. Results show the value of a holistic approach to comparing health risks in designing urban living. By monetising outcomes, practitioners were able to understand the relative magnitude of risk within a specific area and compare alternate urban development scenarios. Compared to an unmanaged development, the Strategic Framework can mitigate health risks by improving safety and quality of the public realm and add health benefits by encouraging activity and active commuting. Flood risks are managed, and green infrastructure improved and extended. These benefits extend to communities outside the site boundaries. Over 25 years, the PV benefits are £60 - 80 million in averted health costs. Strategic planning for urban areas can unlock the potential of the public realm to tackle health inequalities and mitigate serious risks to public health. Timely access to quantitative information on health can help inform understanding of unhealthy environments, strengthen arguments for good design, reinforce capacity of planning teams and so improve the quality of urban developments.

6.Q. Round table: Artificial Intelligence in healthcare: navigating ethically with equity and workforce empowerment

Abstract citation ID: ckae144.408

Organised by: EUPHA-HCW, -ETH, -MIG, WHO Collaborating Center for Health Workforce Policies and Planning, Faculty of Public Health (UK), Public Health Ethics and Law Network
Chair persons: Abi Sriharan (Canada), Ellen Kuhlmann (EUPHA-HCW)
Contact: e.kuhlmann@em.uni-frankfurt.de

Background: Artificial Intelligence (AI) is emerging as a pivotal technology with vast promises for healthcare. However, integrating AI into clinical and public health settings must be cautiously approached to ensure that it does not inadvertently exacerbate existing health system problems. The healthcare workers, already under severe stress, could view AI as a threat to job security rather than as a support mechanism. Moreover, past experiences with digital transformations, such as Electronic Health Records, have shown that technological integration can sometimes increase rather than decrease the burden on healthcare workers, leading to burnout and dissatisfaction, and thus worsening the healthcare workforce crisis. Furthermore, equity and ethical considerations are paramount in the deployment of AI in healthcare. Data privacy, patient consent, and algorithmic bias must be addressed to ensure that AI applications are designed to support and enhance human decision-making that is sensitive to the social determinants of health and accountable to equity and social inclusion, to the needs and rights of the healthcare workforce, and the dignity of the patients and populations. While AI presents significant opportunities for health systems and healthcare workers, there is a lack of knowledge, evidence-based policies, and ethical frameworks that support equitable and human-centred approaches to AI implementation.

Objectives: This round table workshop aligns three major public health challenges: the integration of AI in health systems, the global healthcare workforce crisis, and the improvement of equity and equality. It critically explores capacity building for AI, equity in AI implementation, and regulatory measures for ethical and responsible AI deployment, addressing the following major questions: What are the critical impacts of AI on the healthcare workforce? How can the healthcare workforce be effectively upskilled and supported to adapt to the changes brought by AI technologies? What regulatory frameworks and governance models are necessary to ensure AI's safe and ethical implementation in healthcare, that is also sensitive to equity, gender equality and the needs of minority groups? Finally, what actionable steps and leadership can public health take to implement AI technologies while addressing the healthcare workforce needs, equity issues, and ethical guidelines? The panellists will illuminate these questions from different disciplinary approaches, helping us to disentangle complexity and to build capacity for evidence-based and socially inclusive AI policies. The workshop contributes to better understand the risks and benefits of AI. It seeks to advance knowledge exchange of good practice experiences and effective implementation.

Key messages:

- The effects of AI on the healthcare workforce must be monitored and strategies adapted to mitigate the healthcare workforce crisis and to upskill and empower healthcare workers.
- There is a need for human-centred and ethically responsive AI implementation and governance measures that support equity, gender equality, and diversity in healthcare settings.

7.A. Skills building seminar: Is Behavioural Science Relevant for Public Health? A Quintuple Helix Lens

Abstract citation ID: ckae144.409

Organised by: EUPHA, WHO/Europe
Chair persons: Iveta Nagyova (EUPHA), Susan Michie (UK)
Contact: ivanagy@gmail.com

Background: On 29 May 2023, the World Health Assembly adopted the first-ever global Behavioural Sciences for Better Health resolution (WHA76.7). This resolution requests the World Health Organization (WHO) to mainstream and support behavioural sciences in public health across the WHO and within Member States; including enhancing awareness, knowledge, and evidence and providing technical assistance, normative guidance, and capacity-building. But is behavioural science really relevant for public health? Why and how it can help us to improve people's health?

Rationale: This workshop seeks to delve into the application of behavioural science in public health within the context of the quintuple helix framework - academia, industry, government, civil society, and the broader environment. Through collaborating across sectors, stakeholders can leverage behavioural science to design more effective strategies for promoting positive health behaviour change, preventing diseases, and addressing public health challenges. This workshop will feature discussions and case studies in various public health domains.

Aim: The main aim of this skills-building seminar is to explore the synergies between behavioural science and the quintuple helix, examining how these collaborations can drive innovation, enhance policy implementation, and foster sustainable health outcomes. By critically examining these intersections, we seek to stimulate dialogue, foster collaborations, and inspire innovative approaches for addressing complex health challenges in our society.

Workshop structure: This workshop will consist of three parts:

- It will start with a short scene-setting presentation by Iveta Nagyova, EUPHA president, highlighting the innovation potential of behavioural science to improve people's health (10 mins).
- In the second part (30 mins), the panellists will discuss concrete examples of interconnections of behavioural science and public health within the quintuple helix framework. 1. Susan Michie will share her experience of interconnections between academia and government as a member of the UK SAGE - Scientific Advisory Group for Emergencies. 2. Simon Bacon will discuss the behavioural lens applied to the commercial determinant of health. 3. Tiina Likki will share WHO/Europe's experience with developing and implementing the European regional action framework for behavioural and cultural insights for health, 2022-2027, 4. Kim Lavoie will speak about community involvement and social innovation within the context of more efficient healthcare systems. 5. Stefano Capalongo will show us examples of salutogenic design and architecture, applying neurobiobehavioural mechanisms.
- The third part (20 mins) will be dedicated to a facilitated discussion with the audience to explore attendees' opinions regarding the challenges and opportunities of applying behavioural sciences to improve people's health and well-being, using the quintuple helix framework.

Key messages:

- Integrating behavioural science within the quintuple helix framework cultivates partnerships advancing effective, inclusive and lasting public health initiatives.
- Fostering cross-sector collaboration establishes an ecosystem driving innovative, equitable and sustainable solutions in public health.

Speakers/Panelists:
Susan Michie
University College London, London, UK
Simon Bacon

7.B. Pitch presentations: Applying AI and Machine Learning

Abstract citation ID: ckae144.410
Leveraging ChatGPT for systematic reviews: how accurate is it for screening by title and abstract?

Antonio Sciurti

A Sciurti[1], G Migliara[2], C Isonne[1], LM Siena[1], C Marzuillo[1], P Villari[1], V Baccolini[1]
[1]Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[2]Department of Life Sciences, Health and Health Professions, Link Campus University, Rome, Italy
Contact: antonio.sciurti@uniroma1.it

Background: Systematic reviews are at the top of the evidence pyramid, but the whole process can be labor-intensive, especially in the screening by title and abstract of retrieved records. Large language models (LLMs), such as ChatGPT, are proficient in natural language processing tasks and offer potential for accelerating this phase. The aim of this study is to assess ChatGPT's performance in screening records for an already published systematic review (doi: 10.1080/21645515.2023.2300848).
Methods: 1601 records with title and abstract were evaluated with ChatGPT 4, using two different prompts to instruct the model: one asking the model to classify each record as included or excluded (Prompt A), and one asking the model to rate each record from 1 to 5 based on inclusion confidence (Prompt B), to compute the model's performance metrics.
Results: The review included 64 records after title and abstract screening, of which 18 after full text screening. Using records included by title and abstract as a reference, prompt B with a rating cut-off of 3 provided 82% sensitivity, 88% specificity and 99% negative predictive value (NPV). With articles included by full text as a reference, 100% sensitivity, 86% specificity, and 100% NPV. An 85% workload saving was reached. Prompts A showed higher workload savings (~93%), high NPVs (~100%) and specificity (~96%), but lower sensitivity (62-72%).
Conclusions: Prompts with a rating cut-off of 3 achieved a better performance, and still relevant workload savings compared to binary classification prompts. These findings can inform prompt-engineering strategies to instruct LLMs and reach both high sensitivity and workload savings.
Key messages:

- Systematic reviews provide evidence synthesis to guide policy and decision-making in healthcare and public health. Such process can be time-consuming, and need for timely evidence is often stringent.
- LLMs can help reduce workload and speed up the title and abstract screening phase of a systematic review, which is considered a major bottleneck in the review process.

Abstract citation ID: ckae144.411
eHealth profile and care coordination of primary care physicians

Stefano Tancredi

M Jendly[1], V Santschi[2], S Tancredi[1], A Chiolero[1]
[1]PopHealthLab, University of Fribourg, Fribourg, Switzerland
[2]La Source, School of Nursing Sciences, HES-SO University of Applied Sciences and Arts Western Switzerland, Lausanne, Switzerland
Contact: stefanotancredi@gmail.com

Background: Digital health or eHealth is a vast field encompassing mobile health (mHealth), health information technology, wearable devices, telehealth, and telemedicine, and is changing the practice of medicine. While it holds promise for enhancing care coordination, its adoption is hindered by various barriers, including at the healthcare professional level. We assessed the eHealth profile of primary care physicians and its relationship with care coordination.
Methods: As part of the Commonwealth Fund 2022 IHP survey of primary care physicians, 1114 physicians in Switzerland completed a questionnaire on their digital health use, and care coordination practices. Based on their responses, we built a digital health score, summarizing physicians' use of digital health tools, and a care coordination score. Associations between both scores were assessed using stratified analyses and multiple linear regression.

Results: Among 1114 participants (46% women, mean age 52), 83% used electronic patient records, 96% used teleconsultations for less than 5% of consultations, and 63% never used connected health tools for the monitoring of patients with chronic diseases. A total of 16% allowed for online appointments, 20% for online medical prescriptions, 52% for communicating electronically lists of medications with other healthcare professionals, and 89% the possibility of e-mail or web communications with the patient. The eHealth score was positively associated with the number of weekly working hours, being an internal medicine specialist or practicing physician, the number of full-time equivalents in the practice, and with being in a group practice setting. The higher the eHealth profile score, the higher was the care coordination score.

Conclusions: Physicians' use of digital health tools was positively associated with care coordination. This could underscore the potential benefits of digital health in enhancing collaborative and interprofessional care practices.

Key messages:

- In a large survey of primary care physicians, the use of digital health tools and care coordination were correlated.
- Digital health could enhance collaborative and interprofessional care practices.

Abstract citation ID: ckae144.412

Detecting Unrecognized Dementia Using Deep Learning Methods with Korean National Claims Data

Ji-Woong Nam

KB Yoo[1]*, JW Nam*[1]*, KM Lee*[1]*, TH Kang*[2]*, JH Yoon*[3]
[1]Division of Health Administration, Yonsei University, Wonju, South Korea
[2]ROWEM, Seoul, South Korea
[3]Department of Preventive Medicine and Public Health, Yonsei University, Seoul, South Korea
Contact: wiswoong@yonsei.ac.kr

Background: Dementia is one of the leading causes of death in elderly people. In Korea, the government supports dementia screening for people aged 60 and older, but it is not a population-based organized screening program. It is difficult to achieve early diagnosis and early treatment. The objective of this study is to detect unrecognized dementia using Korean National Claims Data for early diagnosis.

Methods: This study used the National Health Insurance Claims data in Korea. The case group is the new dementia visit as an unrecognized group, while the control group was randomly selected from the general population without dementia. The predictors included health utilization, socioeconomic and demographic, procedure codes, diagnostic codes and health screenings data. The health utilization variables included length of stay, the number of outpatient visits, health expenditures and other encounter information. All medical utilization data was aggregated monthly. In the case group, 12 months of data from 6-month or 2-years before the onset of dementia were used. In the control group, 12 months of data from randomly selected time point were included. Transformer, embedding methods, and Time2Vec were used as the deep learning methods. This study included 453,306 incidents of dementia, representing almost all cases reported from 2010 to 2019 in Korea. The control group consisted of 669,873.

Results: After training the deep learning prediction model, the AUC for 6-month dementia prediction on the test dataset was 0.87, and for 2-year dementia prediction, it was 0.76. The most important variables were health utilization variables, especially health expenditures. The health utilization trajectories of the case group were significantly different from those of the control group.

Conclusions: Based on the claims data, we could detect unrecognized dementia case. We can extend the model to other chronic disease such as cancer and stroke, which are significant burden of disease.

Key messages:

- Screening in healthcare facilities or using lab test results would be more accurate, but it would be difficult to apply to a large population due to the cost-effectiveness and timeliness constraints.
- On the other hand, the detection model using the existing claims data would be helpful to to develop cost-effective mass screening program. It can cover the weakness of current screening program.

Machine Learning powered Patient Records Analysis for Injury Monitoring in Children and Adolescents

Annina Zysset

A Zysset[1]*, S Feer*[1]*, FM Saaro*[2]*, M Bächli*[3]*, S Niemann*[3]*, D Meier*[3]*, M Seiler*[4,5]*, J Bogojeska*[2]*, J Dratva*[1,6]
[1]Institut of Public Health, ZHAW School of Health Sciences, Winterthur, Switzerland
[2]Centre for Artificial Intelligence, ZHAW School of Engineering, Winterthur, Switzerland
[3]Swiss Council for Accident Prevention BFU, Bern, Switzerland
[4]Pediatric Emergency Department, University Children's Hospital Zurich, Zurich, Switzerland
[5]Children's Research Centre, University Children's Hospital Zurich, Zurich, Switzerland
[6]Medical Faculty, University of Basel, Basel, Switzerland
Contact: Annina.Zysset@zhaw.ch

Background: Injuries to children and adolescents are common and are associated with individual suffering and costs. Switzerland lacks data of injuries in children and adolescents. This study investigates the feasibility of utilizing machine learning (ML) methodology to automatically extract relevant data from electronic pediatric patient records needed for monitoring and prevention purposes.

Methods: The feasibility study follows three steps. 1. Utility evaluation of text data from electronic pediatric patient records regarding ML, injury monitoring and prevention requirements in a test-sample. 2. The development of an ML-based approach to extract relevant information based on electronic pediatric patient records ($N = 30'884$) of children treated for injuries at the University Children's Hospital Zurich emergency department between 2018-2022. 3. The performance of the ML methodology is evaluated.

Results: Qualitative and ML expert assessment of the sample showed that the desired data on injuries is contained in the test-sample and necessary requirements are met. Data records differ in detail with severe injuries providing especially rich information records. The international IDB code-tree was proved to be too elaborate and adult-orientated and was adapted. Preliminary data analyses indicate that the number of accidents is highest in the age group from 0 to 4 years (36%). More male (58%) children were treated. Majority of accidents were classified as less severe (73%), few ($<1\%$) as very severe. Further lessons learned, along with more detailed prevalence data on injuries in children and adolescents, will be available by August 2024.

Conclusions: Extraction of injury information from electronic patient record by means of ML may provide valuable information for injury monitoring and prevention, so far missing in Switzerland. Prerequisites for the successful application of ML are digital record access, usable coding-tree, and detailed text input by the emergency departments.

Key messages:

- An ML-based approach has the potential to improve the data basis by extracting valuable accidents information from existing texts of patient records.
- To successfully apply this method, digital record access and detailed text data are needed.

Abstract citation ID: ckae144.414
Preventing type 2 diabetes in Portugal: a novel person-centered digital intervention

Joana Alves

J Alves[1], IB Félix[2], J Balsa[3], MM Marques[1], N Pimenta[4,5,6], MP Guerreiro[2]

[6]SPRINT, Polytechnic University of Santarém, Santarém, Portugal
Contact: joana.alves@ensp.unl.pt

Introduction: Diabetes, particularly type 2 diabetes (T2D), stands as one of the leading noncommunicable diseases worldwide. In Portugal, the prevalence of diabetes has surged, with T2D affecting 14% of adults in 2021. Its repercussions extend beyond individual health, deeply impacting familial, social, and community dynamics, presenting a significant public health challenge globally.

Objectives: The VA|PREVENTION project (https://doi.org/10.54499/2022.02969.PTDC) aims to assess the (cost-) effectiveness and implementation of an innovative person-centered digital intervention to prevent T2D among high-risk adults.

Methodology: A comprehensive approach encompasses the Behavior Change Wheel for intervention design, scalability principles, the WHO guidelines for digital health interventions, co-design, and the ISO framework for usability assessment. Evaluation will be pursued through a type 1 hybrid effectiveness-implementation study (randomized controlled trial), supplemented by qualitative and economic studies.

Results: The web application prototype features Ema, an automated virtual human coach (VHC), educational menus and a dashboard (version 1.0). Co-design included 2 workshops with 11 representatives of end-users and health professionals. Ema uses standardized techniques from an ontology to support behavior change, based on an initial assessment of low-level target behaviors (e.g. walking, fruit consumption, and reducing red meat intake), and barriers to performing these behaviors. Ema communicates in a helpful-cooperative style using a synthetic voice in European Portuguese, with its speech also appearing as subtitles on the interface. Users interact with Ema by pressing buttons or entering data, such as the daily number of steps. Ethics approval was granted for usability assessment with end-users.

Conclusions: The project is expected to yield health, scientific, technological, and policy impacts, powered by an exploitation and sustainability roadmap.

Key messages:
- Innovative type 2 diabetes prevention through a scalable web app with a virtual human coach.
- Comprehensive and robust approach for developing and evaluating the digital behavior change intervention.

Abstract citation ID: ckae144.415
I am frail and my robot is stuck on the corridor: cohabitation of people with frailty and robots

Evangelia Chrysikou

[4]School of Computer Science and Informatics, Cardiff University, Cardiff, UK
[5]Hobbs Rehabilitation Intensive Neurotherapy Centre, Bristol, UK
Contact: e.chrysikou@ucl.ac.uk

UK and European policies promote research and innovation for people living with frailty (PLWF), as realistic strategies for independent living. Yet homes are not designed for PLWF or robots, even though robots could support PLWF with activities, i.e., exercise and companionship. Adoption of robots in homes is limited to devices such as automated vacuum cleaners and voice assistants. Robotics aimed at assisting PLWF have been thus far been tested in laboratories and the study of real homes for the co-habitation of robots and older people is often neglected. We draw on expertise from human-robot interaction, built environment, public health and clinical practice to facilitate optimisation of human and robot co-habitation for PLWF. For this, we have reviewed different robots-for-frailty, in terms of, ability to fit and move within homes. We utilised a range of methods and sources of information including meetings with allied health professionals, visited the Robot House and explored the available robots from a fit for purpose perspective, audited five flats for PLWF in Gloucester, England in accordance with the needs of those with frailty, simulated robot's function within the home environment, using persona's for different use case scenarios, trial testing of selected robots in the home environment for comparison with simulation, using knowledge gained to extrapolate this data to estimate suitability for frail individuals in their homes. Most robots currently available would not adequately fit in an independent living accommodation or the smaller ones could be a tripping hazard. The communal areas of independent living would be more realistic for such human robot interactions, rather than the actual households. The research informs the process facilitating the adoption of robots to benefit PLWF both feasible and desired. The research produced a framework that can lead to future research exploring robot and PLWF co-habitation in real home settings.

Key messages:
- The cohabitation of humans and robots currently faces barriers relevant to independent living built-environment spatial restrictions.
- Technologies that support independent living and frailty must develop in spatially-unobtrusive ways.

Abstract citation ID: ckae144.416
Patients' and professionals' experiences with remote care during COVID-19: a qualitative study

Jelena Kollmann

J Kollmann[1], S Sana[1], I Merkelbach[1], PL Kocken[1], S Denktas[1]
[1]ESSB, Erasmus University Rotterdam, Rotterdam, Netherlands
Contact: kollmann@essb.eur.nl

Background: There are concerns about access to remote care for patients from low-income neighborhoods, as their first point of contact in Dutch health care is the general practitioner (GP). Now that general practice professionals have returned to the pre-pandemic ways of health care delivery, this paper looks back at experiences with remote care during COVID-19. It investigates experiences of both patients and general practice professionals with the approachability and appropriateness of remote care, and their satisfaction.

Methods: In this qualitative study, interviews were conducted with 78 patients and 18 GPs, 7 nurse practitioners and 6 mental health professionals from general practices in low-income neighborhoods. Interviews took place by phone or in person in the native language of participants.

Results: Patients from low-income neighborhoods generally found remote care to be approachable, especially telephone consultation. In contrast, video calling was rarely used. Most patients thought remote care was possible for minor ailments but still wanted to see the doctor face-to-face regularly. Patients were generally satisfied with remote care at the time, but this did not necessarily reflect their willingness to continue using it in the future. Moreover, there was lack in consensus among general practice professionals on the appropriateness of remote care for certain physical and mental complaints. Nurse practitioners and mental health professionals had a negative attitude toward remote care.

Conclusions: Integrating remote care in general practices in low-income neighborhoods is not only important in times of crisis, but also for the future where care is becoming increasingly digitalized. To achieve full integration of remote care in general practices, it is important to take opinions and barriers of patients and providers into account. It is also recommended to create guidelines for reaching consensus on the cases in which remote care can be appropriately used.

Key messages:

- Take opinions and barriers regarding remote care of GP patients and providers into account.
- Create guidelines to reach consensus on the appropriate use of remote care for GP patients' health problems.

[2]Department of Mathematics and Statistics, McGill University, Montreal, Canada
Contact: yannan.shen@mail.mcgill.ca

Introduction: Digital disease surveillance (DDS) detects public health events from internet-based data e.g., online news. Event features depicting epidemiological and social characteristics of health events can be extracted from news using the natural language process techniques. However, few studies have leveraged the event features to support anomaly detection in DDS. We aimed to understand the distribution of the event features and explore anomaly detection using the frequency of these features.

Methods: We collected event data from COVID-19-related news collected from October 1 to December 31, 2021, sourced from BioCaster, an infectious-disease-focused DDS system. The predefined event features in BioCaster include disease, pathogen, location and 14 binary features, such as if an event was caused by an unclassified virus. We described the distribution of the features and detected changes in the frequency of event features using a Bayesian online change point detection. We compared the change points with the number of new cases and of genomic samples collected.

Results: We included 170,168 news articles reporting COVID-19 in 155 countries. The event feature indicating that an event was caused by an unclassified virus was identified as positive among 3831 (2.25%) news and 12.91% of news had positive value for the feature indicating cases who had travelled across international borders. The change points detected from these two features were temporally correlated to the emergence of the Omicron variant in corresponding countries, which was more significant in countries with at least 300 news articles. Conversely, event features irrelevant to this case study, e.g., if the cases were military workers, were identified as negative in all news and no change points were detected.

Conclusions: Our study highlights the potential of monitoring the frequency of event features extracted from online news for anomaly detection in DDS, which relies on sufficient news coverage.

Key messages:

- Monitoring the event features extracted from online news provide is useful approach for automatic anomaly detection in digital disease surveillance.
- Increasing media coverage is fundamental for improving the early detection in a digital disease surveillance system.

7.C. Scientific session: Commercial determinants of health: impeding attainment of the Sustainable Development Goals

Abstract citation ID: ckae144.418

Organised by: American University of Beirut (Lebanon), Global Commercial Determinants of Health Action Network
Chair persons: Jihad Makhoul (Lebanon)
Contact: jm04@aub.edu.lb

The commercial determinants of health (CDOH) and the adverse impacts they have on health equity globally, have recently emerged as an innovative growing field of research in public health. The corporate playbook comprises a myriad of strategies and tactics that aim to enhance profitability for the commercial actors, while harming health and posing grave risks to planetary health for current and future generations. The literature however, rarely explicitly makes the connection between commercial determinants and the impact they have on the attainment of the Sustainable Development Goals (SDGs) set out by the United Nations in 2015. This workshop aims to use the commercial determinants of health framework as a new approach to draw attention to, and make linkages between, commercial determinants and the challenges they pose to the attainment of several if not all the global SDGs. The four presentations showcase exemplars of the commercial determinants to include the firearms industry, fossil fuel industry, food industry and the tobacco industry focusing on impacts in low- and middle-income countries (LMICs). The workshop will start with a brief overview of the CDOH framework, their corporate playbook, and the progress in SDG attainment globally while presenting the first case on the firearms industry trade impacting armed conflicts that impede SDG 3 (good health and wellbeing), 10 (reduced inequalities), and 16 (peace, justice and strong institutions). The second presentation will discuss how the fossil fuel industry uses greenwashing tactics to conceal its harmful activities thereby compromising SDGs 7 (affordable and clean energy), 11 (sustainable cities and communities), and 13 (climate action). The third presentation will address how the tobacco industry impedes the advancement of SDG 3, 8 (decent work and economic growth), 13 (climate action) and 17 (partnerships for the goals) perpetuated by national system level attributes. The last presentation will showcase how the food industry challenges SDG 3 in its production of ultra-processed foods. The workshop will draw on evidence from LMICs, but is also eye opening for high-income countries of Europe which face industry interference in social and health policymaking progress in SGD attainment. The audience will be engaged in a short warm-up exercise at the start of the workshop through an app for real-time feedback accessed through a QR code on the screen, and will interact with the presenters at the end of the workshop if time permits.

Key messages:
- All commercial actors pose a direct or indirect threat to progress in attaining the SDGs.
- The commercial determinants of health pose are in direct contradiction to the SDG 17 through their corporate playbook.

Abstract citation ID: ckae144.419
The firearms industry challenges progress on SDGs in the Middle East

Jihad Makhoul

J Makhoul[1], *M Saad*[1], *R Nehme*[1]
[1]Department of Health Promotion and Community Health, American University of Beirut, Beirut, Lebanon
Contact: jm04@aub.edu.lb

Firearms violence is a grave public health issue globally. Relevant public health outcomes include in addition to death, long term disability, and mental health harms. Further adverse effects on public health in armed conflicts include forced displacement, destruction of life supporting infrastructure and natural resources, in addition to adverse outcomes on civilian populations caught up in wars and protracted crises, who bear the burden more if located in low- and middle-income countries (LMICs) of the world. Firearms violence is understudied beyond recent research which focuses on gun violence at an individual level in the context of the Global North, such as in the US, and which rarely addresses the marketing and lobbying strategies of the firearms industry globally to increase sales and consumption of its products. This focus on civilian level gun ownership and violence obscures the influence of the underlying commercial determinant, the firearms industry. Armed conflicts globally are fueled to a great extent by the weapons produced by the firearms industry and their trade, the majority of which are manufactured in industrialized countries, such as the US, UK and China. Based on the above and through the commercial determinants of health framework, this presentation will illustrate using the Middle East as a case, how the firearms industry gravely undermines and threatens the majority of SGDs, 3 (health and well-being), 10 (inequality reduction) and 16 (peace and justice) directly, and several of the others indirectly. Implications for research are also discussed.

Abstract citation ID: ckae144.420
Greenwashing by the fossil fuel industry: impediments to SDGs

Nourhan Talhouk

J Makhoul[1], *N Talhouk*[1], *J Loutfi*[1], *A Al-Madhwahi*[1]
[1]Faculty of Health Sciences, American University of Beirut, Beirut, Lebanon
Contact: nwt02@mail.aub.edu

The fossil fuel industry, a major commercial determinant of public and environmental health, constitutes a central challenge to the achievement of the SDGs. Motivated by profit, the industry has contributed to establishing the current global reliance on fossil fuel as the primary energy source and essential raw material in global production. Major oil companies have purposefully hindered the research and transition towards renewable energy. This was achieved through an intricate web of interference and mechanisms that fall under the corporate playbook, such as political interference through lobbying to stagnate carbon emission reduction, influences on carbon pricing policies, and hinderances to environmental protection legislation. These practices known as ‘greenwashing’ have resulted in misinformation, interfered with climate action in an aim to increase demand for their products, to decrease the pressure from society on the industry, and portray a green image to consumers. Using the commercial determinants of health framework and focusing on the Middle East, this presentation will illustrate how fossil fuel companies falsely advertise their products as environmentally friendly, resulting in environmental degradation, and impede the achievement of most SDGs, especially SDG 3 (good health and wellbeing), SDG 7 (affordable and clean energy), and SDG 13 (climate action).

Abstract citation ID: ckae144.421
How Big Tobacco exploits the UN SDGs to advance its own goals

Rima Nakkash

R Nakkash[1]
[1]Department of Global and Community Health, George Washington University, Virginia, USA
Contact: Rnakkash@gmu.edu

Globally, the tobacco industry poses a major barrier to the advancement of the Sustainable Development Goals through its influence on SDG 3 (health and well-being), 8 (decent work and economic growth), 13 (climate action), and 17 (partnerships for the goals). Soon after the launch of the SDGs report, Big Tobacco immediately used it to promote its own agenda for development in LMICs such as Lebanon. Using the commercial determinants of health model, this presentation will highlight global and local tobacco monopoly practices, specifically the Lebanese Regie, as a commercial actor and their practices linked to the SDGs to illustrate how the tobacco industry compromises SDG advancement. The presentation will also address some of the system level attributes that serve to perpetuate such practices in Lebanon, allowing for tobacco industry free reign in the country. The presentation will end with suggestions on how LMICs, such as Lebanon, can address the growing industry influence on advances in SDGs and discuss potential measures to curb harmful commercial actor practices.

Abstract citation ID: ckae144.422
The Food industry barrier to achieving the SDGs

Melissa Mialon

M Mialon[1]
[1]Inserm, Paris, France
Contact: Melissa.mialon@inserm.fr

The presentation will use the food industry and the model of the commercial determinants of health to illustrate how commercial actors are a major barrier to progress towards the SDGs. Ultra-processed foods, whose consumption is linked to ill-health, are indeed aggressively marketed - thus directly posing a barrier to progress towards SDG 3 (health and well-being). The industry also uses its corporate political activity to prevent the introduction of measures that limit the consumption of such harmful products and halt harmful practices. SDG 17, which promotes partnerships for the goals, is in direct contradiction with these realities. The presentation will also discuss why the current political-economic system needs to be reformed. The presentation will end with a discussion on solutions, including pitfalls if we are to address the commercial determinants of health for a better food system.

7.D. Scientific session: Digital health divide in access, use, and effectiveness: Examples from three countries

Abstract citation ID: ckae144.423

Organised by: Leibniz ScienceCampus Digital Public Health Bremen (Germany)
Chair persons: Saskia Muellmann (Germany), Chungwan Lo (Germany)
Contact: muellmann@leibniz-bips.de

The increasing digitalisation of the healthcare system opens up a wide range of opportunities but also poses challenges in reducing inequalities due to unequal technological access as well as social and demographic differences of populations. This so-called digital divide is the opposite of digital inclusion, defined by the United Nations as “equitable, meaningful, and safe access to use, lead, and design of digital technologies, services, and associated opportunities for everyone, everywhere”. Indeed, digitalisation is a global phenomenon that permeates all levels of determinants of health inequities, leading to several populations being more disadvantaged. Age, gender, education, and economic status are significant factors amplifying the digital divide’s impact, with older individuals, women, less educated individuals, and economically deprived populations bearing disproportionate effects. Prior literature suggests three levels of digital divide: 1) access to internet and digital technology, 2) individual cognitive and technical competencies in utilizing digital tools, and 3) effectiveness or the optimal functionality and reach of digital technologies. Although there is less consensus with regards to the scope of the divide in the health sector, the three levels are the common reference. Nonetheless, this lack of agreement resulted in existing literature to be concentrated around digital health literacy, or the cognitive and technical abilities to use digital technologies. In addition, while tools such as the Global Digital Health Monitor are valuable to track, monitor, and assess the enabling environment for digital health worldwide, it does not capture the lived experience of the population, including the disadvantaged population groups. This workshop aims to 1) generate discussion on digital health divide and how it can be operationalized and 2) reflect on potential actions to counteract these injustices. Case studies from Germany, Indonesia and Argentina will be presented to diversely contextualize the inequities in digital health and assess plausible interventions. The workshop will be divided into four parts. First, an introduction to the digital health divide will be presented as well as its public health relevance (10 minutes). Second, researchers representing three countries (i.e., Germany, Indonesia, and Argentina) will present digital health divide case studies within their context of expertise (15 minutes). Third, a case-based discussion will be conducted with participants. Participants will be allocated into groups based on the three levels of the digital health divide (i.e., access, use, and effectiveness) and work on recommendations to best operationalize and narrow the digital health divide (25 minutes). Finally, the workshop will conclude with a wrap-up of the group discussion results (10 minutes).

Key messages:

- The digital health divide affects all regions, regardless of income levels. Narrowing the gap is crucial to reduce health inequity and achieve universal health coverage.
- By clearly defining the scope and operationalization of the digital health divide, its measurability and usefulness to inform health policies and programs to address this issue can be enhanced.

Abstract citation ID: ckae144.424
Introduction to the digital health divide

Núria Pedrós Barnils

N Pedrós Barnils[1,2]
[1]Institute for Public Health and Nursing Research, Bremen, Germany
[2]Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany
Contact: nupedros@uni-bremen.de

This presentation will introduce the concept of digital health divide. It refers to inequalities in accessing and using digital technologies, leading to digital exclusion. Digital inclusion is defined by the United Nations as “equitable, meaningful, and safe access to use, lead, and design of digital technologies, services, and associated opportunities for everyone, everywhere”. Indeed, digitalisation is a worldwide phenomenon that permeates all levels of determinants of health inequities, leading to several populations being more adversely affected. Age, gender, education, and economic status are significant determinants amplifying the digital divide’s impact, with older individuals, women, less educated individuals, and economically disadvantaged populations bearing disproportionate effects. The relationship between the digital divide and health leading to the digital health divide can be direct and indirect. Here, access to the latest advancements in health technologies used along the health span (eHealth, mHealth) - from health prevention to patient care - can directly influence the user’s health. However, the lack of access to or use of existing technologies can also indirectly affect their well-being. A globally informative example of this indirect association is the lack of internet access in rural areas during the hard COVID-19 lockdowns, leading to the loss of a school year for many pupils. Indeed, school attendance and attainment are associated with better physical and mental health. Currently, there is a lack of operationalisation of the digital health divide, making it difficult to measure it accurately. The absence of a standardised evaluation and therefore evidence-based information hinders governments and organizations’ efforts to effectively address digital health divide.

Contact: muellmann@leibniz-bips.de

Even though Germany is an industrialised country, health inequalities exist between individuals or population groups due to unequal access to scarce social resources such as money or knowledge. This case study illustrates the extent of the digital divide in access and use of digital health technologies. Data from the Liter@te study, in which 96 adults aged 18-64 years with low reading and writing skills living in Germany were asked about their digital health technology use and their digital health literacy, were compared with two parallel conducted population surveys in Germany (i.e., nationwide telephone survey on digitalisation and health with 1020 internet users aged 18 years and above, online survey on digitalisation in health care with 1839 adults aged 18-80 years insured at a statutory health insurance company). Adults with low reading and writing skills used digital devices in the health context such as computers (23% vs. 71%) or activity trackers (21% vs. 35%) less frequently than the general population, whereas no differences were reported in the use of smartphones (79% vs. 70%). In addition, 18% of adults with low reading and writing skills and 4% of the general population stated that they do not use digital health technologies. Other digital health technologies such as online appointment scheduling (25% vs. 81%) or health websites (32% vs. 45%) were also used less frequently by adults with low reading and writing skills compared to the general population. Participants in the Liter@te study who do not use digital health technologies reported more frequent access problems (e.g., no suitable device, technical problems, poor internet connection) than participants in the population survey. 35% of participants in the Liter@te study have a low digital health literacy (eHEALS score between 8-19/40 points), compared to only 8% in the population survey.

Digital health divide in Indonesia: evidence from national-level data

Herfina Nababan

H Nababan[1,2]
[1]Institute for Public Health and Nursing Research, Bremen, Germany
[2]Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany
Contact: hnababan@uni-bremen.de

Indonesia is a country in south-east Asia with a diverse population and context underlined by its geographical condition as an archipelagic country. Due to closer proximity to the capital, the Western regions (e.g., provinces in Sumatra and Java islands) are relatively more developed than the central and eastern parts of Indonesia (e.g., Nusa Tenggara, Sulawesi, and Papua). In the last few years, the country started to embrace digital transformation for public services including the health sector. Accelerated by the COVID-19 pandemic, a proliferation of digital health services through for example the use of telehealth and health apps is now considered important to improve access and availability of health services, especially among marginalized and hard-to-reach populations. Nonetheless, the difference in access to information and technology infrastructure and services as well as in the level of digital literacy across different regions in Indonesia may perpetuate the existing inequity in access to health services. In 2022, data from the Indonesian Central Bureau of Statistics showed that the level of internet access in Indonesia's capital Jakarta has reached 85%, while the level in the eastern part of Indonesia (i.e., Papua) is only 26%. Similarly, the level of internet access in the Western provinces tend to be higher than their Eastern counterparts. Additionally, a survey performed by the Ministry of Communication and Informatics to assess the level of digital literacy in Indonesia shows that 85% out of 10,000 respondents accessed the internet through smartphones. However, almost all respondents encounter problems when accessing the internet, especially regarding network quality which causes unstable and frequent connections disconnected. In addition, the level of digital literacy varies across different regions, with the Western region performing better than other regions (e.g., digital literacy index of 3.64 in Yogyakarta vs 3.55 in Papua in 2022).

Abstract citation ID: ckae144.427
Digital health divide and digital technologies for treating substance-related disorders in Argentina

Manuel Badino

M Badino[1,2]
[1]School of Medicine and Health Sciences, Madrid, Spain
[2]Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany
Contact: manuel.badino@mi.unc.edu.ar

Argentina is a country located in the South American region with more than 45 million inhabitants. According to the National Institute of Statistics and Censuses, over 92% of the population lives in urban areas. Additionally, 47% households do not have access to computers, and 12% lack availability of the internet. The present case study demonstrates the effects of the digital divide regarding the use and access to digital technologies in patients who underwent virtual treatment for substance-related disorders in a mental health service in the city of Córdoba, Argentina. This treatment modality included virtual consultation with a psychologist and WhatsApp groups for mutual support. The data obtained is part of a larger research project aimed at evaluating access to digital healthcare treatment, quality of life and patient satisfaction with the use of digital tools for treating substance-related disorders. Participants were adults between 25 and 60 years. The majority of the patients who were surveyed presented cognitive impairment and unemployment status. Those who completed secondary school (79%), stated that virtual consultation was easy to conduct (83%) and WhatsApp group texting information for mutual support was very difficult to comprehend for participating actively (63%). On the other hand, participants who only reached primary school (21%) declared that virtual consultation was easy to do (71%) and WhatsApp group texting information for mutual support was very difficult to comprehend for participating actively (87%). Concerning access, 78% of participants answered that they have difficulties with the availability of digital devices (i.e., smartphones, computers, or tablets), internet connectivity and privacy at home or work for undergoing digital treatment.

7.E. Pitch presentations: Health hazards and impact on health

Abstract citation ID: ckae144.428
Noise inequalities and cardiovascular diseases in Bulgaria

Dima Tsanova

D Tsanova[1], *TS Vitkova*[1], *EM Bankova*[1], *B Ivanova*[1], *D Dimitrov*[1]
[1]Faculty of Public Health, Medical University - Pleven, Pleven, Bulgaria
Contact: d_krumova@abv.bg

Background: Social determinants of health in the physical environment are among the social determinants that greatly impact population health. At very high levels, noise can cause permanent changes in a person's psyche but, even at lower levels, it can cause stress and disorders. Global burden of diseases studies arrange noise on the second position among the environmental risk factors, related to sleep disturbance, cardiovascular effects etc. The study aims to analyse noise pollution in Bulgaria and measure its association with cardiovascular diseases.

Methods: National Statistical Institute and Eurostat data were used to analyse the noise pollution in Bulgaria. The 28 regions were compared according to the proportion of surveyed points above permissible limits and the death rates due to CVD, /2022/. Data were statistically processed with SPSS v.26. To establish the correlation, the Pearson coefficient was used.

Results: Data provided by Eurostat reveal that 9% of the total population suffers from noise but there is a very positive trend - from 17.7% /in 2005/ to 8.7% /in 2023/. The share of surveyed points above permissible limits shows a continuing trend of maintaining a high percentage - 71.80% /2011/ and 68.62%/2022/. The district comparison shows significant variations - Blagoevgrad -17.65% and Silistra, Kyustendil and Razgrad with shares above 80%. The study found that almost all districts with the highest share of surveyed points above permissible limits have higher levels of death rate due to CVD. The results of statistical data analysis show that there is a positive moderate linear correlation between the share of surveyed points above permissible limits and the death rate due to CVD - Pearson coefficient 0.423 ($p = 0.025$).

Conclusions: The study found a moderate correlation between noise pollution and the death rate due to cardiovascular disease. CVD have a multifactorial genesis, but reducing noise in urban areas would help prevent these diseases.

Key messages:

- As a result of the performed analysis, it can be concluded that the investigated indicators determining the degree of discomfort during the daily period remained high in Bulgaria.
- The established health inequalities between regions and the increasing mortality from CVD are one of the factors for the deteriorating level of public health in Bulgaria.

Radon Exposure Is Associated with Breast Cancer Risk: A Long-Term Population-Based Study from Finland

Peng Li

P Li[1,2], *C Lin*[3], *P Martikainen*[1,2,4], *M Myrskylä*[1,2,4]
[1]Population Health, Max Planck Institute for Demographic Research, Rostock, Germany
[2]MaxHel Center, Max Planck – University of Helsinki, Rostock, Germany
[3]National Cancer Center, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, China
[4]Population Research Unit, University of Helsinki, Helsinki, Finland
Contact: penglistat@outlook.com

Background: Radon is a common environmental carcinogen. It is not known whether radon exposure and breast cancer risk are associated at the population level.

Methods: Women continuously living in Finland during the 1987-2016 period were linked to municipality-level indoor radon data annually to estimate their cumulative radon exposure over 30 years. Breast cancer incidence was observed over five years from 2017 onwards. Association between radon exposure and breast cancer incidence was assessed using conditional Cox models adjusted for family history of breast cancer, reproductive history, and socio-demographic covariates. Population attributable fractions (PAF) of breast cancer due to radon exposure were estimated. Robustness analyses were conducted in the population who lived only in houses.

Results: Among 1,335,947 women, 20,067 breast cancer cases were observed during a median follow-up period of 4.9 years. Among women who were exposed to high levels of radon (>100 Bq/m3), overall breast cancer incidence was 10% higher (Hazard ratio 1·10 [95% CI 1·05-1·16]), duct carcinoma incidence was 6% higher (1·06 [1·00-1·13]), lobular carcinoma incidence was 8% higher (1·08 [0·94-1·23]), and the incidence of other morphological sub-types was 34% higher (1·34 [1·17-1·53]) than among other women. Robust associations with overall breast cancer incidence (1·12 [1·05-1·20]) and the incidence of morphological sub-types in the house sample. Correspondingly, suggestive dose-response associations were observed.

Conclusions: High radon exposure is associated with elevated breast cancer risk at the population level, and this relationship is independent of well-established risk factors.

Key messages:

- This study investigates the association between long-term radon exposure and breast cancer incidence based on national register data.
- High radon exposure is robustly associated with breast cancer risk in general Finnish population.

Abstract citation ID: ckae144.430
Burden and economic impact of PM2.5 exposure on Acute Myocardial Infarction in Portugal, 2011-2021

Francisco Madeira

F Madeira[1,2], *M Corda*[3,2], *C Martins*[1,2], *J Perelman*[1,2]
[1]NOVA National School of Public Health, Lisbon, Portugal
[2]Comprehensive Health Research Center, Lisbon, Portugal
[3]CiiEM, Egas Moniz School of Health & Science, Caparica, Almada, Portugal
Contact: fmc.madeira@ensp.unl.pt

Background: Air pollution, specifically particulate matter with a diameter of 2.5 micrometers (PM2.5), is the primary environmental health risk in Europe. Exposure to PM2.5 increases the risk of cardiovascular diseases, including AMI, resulting in high direct costs associated with in-patient treatment. This study aims to estimate the avoidable and attributable disease and economic burden of AMI due to ambient PM2.5 exposure in Portugal between 2011 and 2021.

Methods: National databases were used to assess the annual number of hospitalisations and deaths due to AMI between 2011 and 2021. The annual mean costs were calculated using a direct cost analysis (bottom-up micro-costing) to assess the direct economic burden of AMI. In turn, these cases and associated costs were multiplied by the respective morbidity and mortality population attributable fraction (PAF) to estimate the number of hospital admissions and deaths, and their associated costs attributable to ambient PM2.5 exposure. For 2019 and 2021, an alternative scenario of exposure was considered (2021 WHO Air Quality Guidelines), and the avoidable morbidity and mortality costs were determined using the potential impact fraction (PIF).

Results: Between 2011 and 2021, there were 130,447 hospitalisations and 47,968 deaths due to AMI, with 4.79% and 28.90%, respectively, attributable to ambient PM2.5 exposure. This translates to a direct economic burden of morbidity of more than 44 million euros and mortality of almost 195 million euros. If the proposed scenario guidelines were met, 279 cases and 448 deaths would have been avoided in 2019, resulting in a savings of almost 9.7 million euros. In 2021, 93 cases and 355 deaths would have been avoided, with approximately 4 million euros saved.

Conclusions: Exposure to ambient PM2.5 significantly contributes to AMI cases and deaths in Portugal, imposing a significant economic burden. These findings highlight the urgent need for measures to improve air quality.

Key messages:

- PM2.5 pollution in Portugal drives AMI cases and fatalities, entailing significant economic costs.
- Adhering to WHO air quality guidelines promises substantial reductions in AMI incidence and save millions annually in healthcare expenditure.

[5]Nofer Institute of Occupational Medicine, Lodz, Poland
[6]Barcelona Institute for Global Health, Barcelona, Spain
Contact: kinga.polanska@imp.lodz.pl

Background: The environment in which we live is thought to explain 70% of the non-communicable disease burden. The aim of EXPANSE project (funded from the European Union Horizon 2020 research and innovation programme under grant agreement No 874627) is to evaluate the optimal strategies for maintaining health in the context of contemporary urban environments. As a component of the project, Urban Labs allow deep phenotyping of the urban exposome and assessing its use and perception. The Urban Labs aim to improve exposure assessment, identify mediating and modifying lifestyle factors, and link the urban exposome to intermediate endpoints relevant for cardiometabolic and pulmonary health.

Methods: By monitoring the activities of 4,000 individuals in five distinct urban areas, Urban Labs provide a comprehensive understanding of the urban exposome, which can be compared with residential address-based model estimates. The participants complete a baseline questionnaire, repeated bi-monthly questionnaires and exposure-specific questionnaires over a period of 2 years using mobile phone application (ExpanSeeker). Two-week personalized measurements including spatial-temporal activity patterns, sensor-based environmental and behavioral measurements, and minimally invasive biological sample collection are performed covering different seasons.

Results: The Baseline Questionnaire (BQ) and two-weeks measurement campaigns (MC) were completed in European cities as follows: Athens BQ = 379, MC = 232; Barcelona BQ = 1040, MC = 303; Basel BQ = 731, MC = 655; Lodz BQ = 634, MC = 100; The Netherlands (multicity) BQ = 1033, MC = 326. Data collection process is ongoing.

Conclusions: The collection of novel data on individuals activities and perceptions within temporal and geographical contexts in Urban Labs will contribute to a more comprehensive understanding of how the urban dwellers are exposed to and interact with their environment, thereby supporting healthier urban engineering and policy making.

Key messages:
- Urban Labs will provide a more comprehensive understanding of the impact of the urban environment on individual's behavior, their exposome, enabling more accurate prediction of non-communicable risk.
- Urban Labs will provide a base to support healthier urban engineering and policy making.

[3]Women, Children Public Health Sciences Department, Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
Contact: giulia9134@gmail.com

Background: Living in urban areas has been linked to a rise in noncommunicable diseases. Nevertheless, there is scarcity of evidence emphasizing the combined impacts of certain urban attributes (e.g. pollution, excessive soil sealing, urban temperatures) and the existence of green spaces on health outcomes. Further studies are imperative to evaluate the association between chronic illnesses such as dementia and ischemic heart disease, and the presence of urban green areas.

Methods: We conducted an ecological study in two Italian regions. Prevalence of chronic diseases in Tuscany and Latium were obtained at the municipality level from public health databases available online and Normalized Difference Vegetation Index (NDVI) was calculated for 2023. Descriptive analyses and Poisson regression models were run to assess the association between green space and chronic diseases prevalence, adjusting for age, sex, education, employment, foreign residents, income, urbanicity and spatial correlation.

Results: Preliminary analyses were conducted on 273 municipalities in Tuscany. Mean prevalence per 1000 inhabitants of dementia and ischemic heart disease were 15.75 (SD = 5.3) and 48.25 (SD = 11.06), respectively. Mean NDVI across municipalities was 0.37 (SD = 0.04). Higher green exposure is associated with lower prevalence of ischemic heart disease (β= -0.21; $p < 0.05$) and dementia (β=-0.3, $p < 0.05$). Analyses will be executed for the Latium region and complete results will be available by mid-June.

Conclusions: The presence of urban greenery appears to be associated with a reduction in chronic illnesses. While further studies are warranted, it is crucial to adopt urban policies focused on green spaces and citizens' health outcomes. Generating evidence for decision-makers is essential for shaping urban environments in ways that promote both health and overall human wellbeing.

Key messages:
- Living in green urban areas appears to positively impact human health, reducing chronic disease prevalence.
- Greenery serve as a tool for mitigating and adapting to the climate crisis, promoting health.

Abstract citation ID: ckae144.433
Does the way workplace canteens are managed influence users' plate waste?

Diana Menis

D Menis[1], F Fiori[1], P Cautero[1], D Zago[1], M Driutti[1,2], L Lesa[3], A Conte[4], E Scarpis[5], L Brunelli[1,6], M Parpinel[1]

[6]Accreditation, Quality, Clinical Risk Unit, Friuli Centrale Healthcare University Trust, Udine, Italy
Contact: menis.diana@spes.uniud.it

Background: Plate waste (PW) is part of the food waste and is defined as the amount of edible food served not eaten. There are few estimates of PW in the food services, mainly in school canteens, where PW appears to differ depending on the provider. Our aim was to analyse the role of different canteen management in determining PW in three hospital canteens in Italy.

Methods: On 5 working days between August and September 2022, healthcare workers' trays were photographed before and after meal consumption. We compared two canteens managed by an external catering service (EC) with one internally managed (IC). The two canteens with similar sample size had different management. A modified visual Comstock scale was used to assess the PW. The Carbon Footprint (CF), Water Footprint (WF), energy and nutrient content were estimated using the SU-EATABLE LIFE database and the Italian Food Composition Database for Epidemiological Studies (www.bda-ieo.it). Significance was set at $p < 0.05$.

Results: 1227 trays were analysed (1026 in EC; 201 in IC), most of which contained no waste. The percentage of trays with leftovers was higher in EC (34%) than in IC (21%), as was the mean amount of PW (104g EC vs 60g IC) ($p < 0.001$). The PW contained significantly more energy (125 kcal vs 73 kcal) and protein (6.0g vs 2.4g) and had higher CF (204 CO2eq EC vs 76 CO2eq IC) and WF (178 LH20 EC vs 75 LH20 IC) in CE than in IC. The significance was confirmed independently to the sample size of the canteens, and when the analysis was repeated and only the first access of each user was considered.

Conclusions: Results suggest that an internally managed canteen produces less leftovers than a canteen operated by an external provider. This could be because an internally managed canteen is more adaptable to users in terms of food offerings and portion sizes, despite a smaller number of food options. However, further studies are needed to confirm our findings and to identify the causes of PW in food service.

Key messages:

- Internally managed canteens seem to reduce plate waste, probably due to certain flexibility according to users' plate waste.
- Non-served food of the canteen should be estimated to confirm our data.

Abstract citation ID: ckae144.434
Dietary trajectory profiles of French adults over time: Multicriteria analysis of sustainability

Hafsa Toujgani

H Toujgani[1]*, J Berlivet*[1]*, F Berthy*[1]*, B Allès*[1]*, H Fouillet*[2]*, M Touvier*[1]*, D Lairon*[3]*, F Mariotti*[2]*, J Baudry*[1]*, E Kesse-Guyot*[1]
[1]Nutritional Epidemiology Research Team, Bobigny, France
[2]Paris-Saclay University, Paris, France
[3]Aix Marseille University, Marseille, France
Contact: h.toujgani@eren.smbh.univ-paris13.fr

Despite the urgent need for sustainable dietary transitions, few studies have examined current dietary trajectories using longitudinal data. This study aimed to identify dietary consumption trajectory profiles over an 8-year period (2014-2022) while assessing their sustainability in a multicriteria approach. Consumption data from NutriNet-Santé cohort participants were collected using FFQs in 2014, 2018 and 2022. Dietary trajectory profiles were modeled using group-based multi-trajectory based on factors from Principal Component Analysis on energy-adjusted consumption data ($n = 17{,}187$). Profiles were analyzed for sustainability (environmental and nutritional dimensions) using multi-adjusted mixed-effects models. Six trajectory profiles (P) were identified. P0 (considered as reference) had average consumption for all food groups, with increased plant-based intake over time. In comparison, P1 had the highest baseline alcohol (+301%) and offal intake, increasing processed meat (+74%) and decreasing offal over time. P2 had higher milk (+187%) and sweet drinks intake, increasing animal substitutes (+1737%) and whole-grain products. P3 had higher nuts (+680%) and legumes intake, increasing egg (+166%) and reducing fruit juice. P4 had high fish (+39%) and fruit intake, increasing butter (+53%) and reducing alcohol. P5 had higher pork (+143%) and red meat intake, increasing fish (+31%) and reducing dairy. Initially, P3 and P4 had the lowest GHG emissions (-18%, -49% vs. P0), best nutritional profiles, and higher organic food consumption. P5 had the greatest environmental impact (+51%) and the lowest nutritional scores. Over time, P0 reduced GHG emissions and improved nutritional scores. P3 and P4 showed minimal changes, while P5 had the greatest GHG emissions decrease (-14%) and nutritional quality improvements. Identifying ongoing dietary transition trajectories, our findings contribute to optimizing targeted actions aimed at promoting sustainable dietary consumption habits.

Key messages:

- Regardless of initial dietary preferences, French adults exhibit an overall trend over time towards increased intake of plant-based foods and decreased intake of red meats, at varying scales.
- French adults exhibit varying degrees of transition towards more sustainable diets, with an overall decrease in GHG emissions from food consumption and an improvement in their nutritional profiles.

Abstract citation ID: ckae144.435
Ethically challenging situations in teachers' work: role of school neighborhood socioeconomic status

Maarit Kauppi

M Kauppi[1]*, P Silomaa*[2]*, J Ervasti*[2]
[1]Finnish Institute of Occupational Health, Turku, Finland
[2]Finnish Institute of Occupational Health, Helsinki, Finland
Contact: maarit.kauppi@ttl.fi

Background: Ethically challenging situations are common in the teaching profession and can lead to significant stress. In particular, teachers working in socially disadvantaged areas may face these kinds of situations more often due to conflicts between educational needs and available resources. We investigated the link between school neighborhood socioeconomic status (SES) and the prevalence of ethically challenging situations among teachers.

Methods: Data were from primary school teachers ($n = 1265$) participating to the Finnish Public Sector study in 2022. Experiences on ethically challenging situations were assessed with two questions: In your work how often do you feel that you have to 1) reflect on ethically challenging situations and 2) act contrary to rules, norms, or personal values (at least weekly vs. less frequently). Survey data were linked to information on school neighborhood SES obtained from national grid database. Log-binomial regression models were used to analyze the relationship between school neighborhood SES and ethically challenging situations.

Results: Of the respondents, 61% reported having to reflect on ethically challenging situations, and 18% felt they had to act against rules or personal values at least weekly. Teachers in schools located in the most disadvantaged areas were more likely to feel that they had to act against rules, norms, or values weekly compared to teachers in schools in the most advantaged areas (adjusted RR 1.43, 95% CI 1.01-2.02). No association was observed between reflecting on ethically challenging situations and school neighborhood (adjusted RR 0.98, 95% CI 0.87, 1.11).

Conclusions: School neighborhood SES appears to be associated with teachers' possibilities to choose action in ethically challenging situations.

Key messages:

- School neighborhood SES appears to be associated with teachers' possibilities to choose action in ethically challenging situations.
- It is essential to develop strategies to support teachers in managing ethically challenging situations in their work environments.

7.F. Scientific session: Living lab Cartesius: multidisciplinary cooperation for health monitoring of an ‘urban blue zone’

Abstract citation ID: ckae144.436

Organised by: UMC Utrecht (Netherlands)
Chair persons: Rosalie Hegeman (Netherlands)
Contact: R.M.M.hegeman@umcutrecht.nl

This workshop will be based on health monitoring in living lab Cartesius; a neighbourhood that is currently developed in the city of Utrecht, the Netherlands (Home - Cartesius Utrecht (cartesius-utrecht.nl). The design of this neighbourhood is inspired by the concept of the “blue zones” of Pes and Poulain, places in the world, that they argue are inhibited by the healthiest, longest-living populations because they integrate sustainability, climate adaptation and healthy living. In Cartesius citizens will for example be encouraged to move by inviting outer spaces, meet each other in the community areas and eat healthily nudged by the food options in the food court. An important element of these blue zones is the incorporation of green spaces in the neighbourhood. Examples are (community) parks/gardens, a green walking route around the neighbourhood, trees in the bike parking lots, green facades etc. The neighbourhood is designed to become a home to local species such as plants and animals as well as people. In addition, climate change adaptation is incorporated, the appartements are well insulated and contain solar panels and green and white roofs. Preventing heat stress is considered in the green design of the outdoor spaces and special drainage and water storage equipment throughout the neighbourhood. The municipality has been closely involved in this project from the start, they created the call for developers to create a healthy urban neighbourhood and after selecting the Cartesius project they have remained involved in its development. Of special interest to the municipality is community building (in new neighbourhoods) in order to strengthen social cohesion and prevent loneliness. We will conduct a research on this topic of which the results could permanently impact how new neighbourhoods in Utrecht will be approached. Designers, developers, research institutes, governments and the current inhabitants are now collectively working on a holistic monitoring programme in this neighbourhood to collect evidence for the effects of the “blue zone” interventions and design choices on behaviour, health and well-being of residents. This workshop will focus on various aspects of the Blue Zone Concept, the importance of green in urban living, the participatory role of local residents, the role of stakeholders and the relevance for local governance. First of all the participants will be informed about a unique healthy/green urban living concept based on the blue zones currently in development. The participants will get insights in the process of developing a new healthy neighbourhood where different challenges (e.g. climate adaptation, community building, healthy living environment) are experimented with stakeholders from the quadruple helix (private, government, science and societal stakeholders). Simultaneously, we want to allow room for ample time for audience interaction to share their experiences on similar multi transdisciplinary cooperations and monitoring strategies.

Key messages:

- This session will provide room for knowledge exchange in the area of healthy urban living and transdisciplinary collaboration.
- Specific focus on holistic monitoring of the effectiveness of health interventions in urban living areas and (international) policy implications.

The concept of Cartesius

The workshop will start with a presentation about the concept of the Cartesius neighbourhood. The incorporation of the elements of the Blue Zones will be discussed and images of both the current state of the development and artist impressions of the future finished neighbourhood will be presented. Room for (among other topics) discussion about the ‘translation’ of the blue zone concept to this urban area. This presetntation will be done by Marije Lammers (University Utrecht, postdoc and coordinator monitoring programme healthy urban living in Cartesius)

Incorporating citizens in monitoring

300 appartements in Cartesius are already realized, in which +/- 600 citizens are currently living. In a time span of about 8 years the number of apartments will have increased to 3000, with about 6000 inhabitants. The current citizens are involved in designing the monitoring strategy and community building approach. In order to measure effectively whether the health interventions in Cartesius will impact the citizens’ health their involvement and cooperation is crucial. Room for (among other topics) discussion about involving citizens in monitoring and community building effectively.

WHO Europe Healthy Cities

This presentation will discuss how developments in the Cartesius neighbourhood are in line with WHO Europe Healthy Cities ambitions for bringing about change and achieving improved health, well-being and equitable and sustainable development in cities across the European Region and globally. Room for (among other topics) discussion about possibilities for international knowledge exchange and applications. This presentation will be by: Kira Fortune, Regional Advisor, Healthy Cities, Health Promotion and Well- being, World Health Organization

7.G. Round table: Primary prevention and management of NCDs – the added value of joint actions across Europe

Abstract citation ID: ckae144.437

Organised by: JA PreventNCD, JACARDI, EUPHA-PHMR
Chair persons: Graziano Onder (Italy), Hanna Tolonen (EUPHA-PHMR)
Contact: jorunn.sofie.randby@fhi.no

Two ambitious European joint action projects, funded through the EU4Health programme, are ongoing to reduce the burden of non-communicable diseases (NCDs) and related risk factors in Europe, targeting both individual and societal levels. Together, these projects aim to scale up effective prevention and management strategies, strengthen public health policies and promote equitable and sustainable healthcare systems across Europe. The Joint Action on CARdiovascular Diseases and DIabetes (JACARDI), with 21 participating countries and a total budget of over €66 million, is focusing on enhancing the implementation of evidence-based innovative pilot projects across the entire patient journey. This includes efforts to improve prevention, early diagnosis, and proactive management of NCDs. The Joint Action Prevent Non-Communicable Diseases (JA PreventNCD), with 25 participating countries and a total budget of over €95 million, particularly aims to enhance joint capacities of countries for implementing, scaling up and evaluating prevention policies and actions at various levels. These projects represent complementary responses to calls for action in Europe's Beating Cancer Plan and the Healthier Together - EU NCD Initiative, with JA PreventNCD emphasizing primary prevention and policy while JACARDI focuses on secondary prevention and health systems strengthening. Both projects will generate new policy-relevant evidence based on implementation, monitoring and scaling-up of best and innovative practices and policies across Europe. The projects share a focus on equity, diversity, scalability and sustainability, while avoiding fragmentation and duplication of actions. Under the EU4Health programme, launched to strengthen European health collaboration in the wake of the COVID-19 pandemic, the EU has recently invested over €200 million in public health initiatives, with additional investments from national authorities participating in the joint actions. With this new wave of funding, real population impact should be anticipated, but what can we realistically expect to be the outcomes and what are the criteria for success? In this round table discussion 1) these two joint action projects will be presented, highlighting their innovative aspects; 2) views on the added value and potential in cross-national collaborations for prevention and management of NCDs will be debated, and 3) how synergies will be leveraged for maximum impact will be explored. Panelists will share their perspectives on the projects' potential to change the public health landscape in Europe. Workshop participants will subsequently be encouraged to engage in the discussion with the objective that views and experiences are exchanged, opportunities for collaboration and engagement are shared and energy is mobilized to harness the benefits of such large-scale policy-relevant collaborations.

Key messages:

- Synergies and collaboration to drive policy development and foster increased capacity are the pillars to build a healthier Europe.
- Two large-scale Joint Actions drive impact by highlighting innovative NCD prevention strategies and fostering collaborative engagement.

Abstract citation ID: ckae144.438
Scaling up joint efforts to tackle cardiovascular diseases and diabetes in Europe

Benedetta Armocida

B Armocida[1]
[1]ISS, Rome, Italy
Contact: benedetta.armocida@iss.it

JACARDI, a Joint Action on cardiovascular diseases (CVD) and diabetes (DM), aims to support EU countries in reducing the burden of CVD and DM and related risk factors, both at individual and societal levels, while ensuring health systems sustainability and equity. In particular, JACARDI aims to implement best practices and pilot testing of innovative practices throughout the entire patient journey. Commencing by improving health literacy and raising awareness among general and target populations, moving through primary prevention and screening of CVD and DM among high-risk populations, and then address people living with CVD and DM and their health service providers, through the improvement of service paths and (self) management, including through digital tools, and completing the path by supporting and encouraging the labour participation of people living with these diseases. With 21 European countries and 76 partners engaged, JACARDI undertakes 142 pilot projects, promising to advance CVD and DM care for millions across Europe. In particular, through an innovative Work Package on methodology, JACARDI will develop and implement a methodological framework to guide all the pilot projects in the design, preparation, implementation, monitoring, reporting, and assessment processes. This framework will encompass transversal and intersectional aspects, ensuring a harmonized and efficient approach for all JA activities. Through rigorous and multidimensional evaluation, JACARDI aims to uncover new approaches to enhance healthcare systems, grounded in evidence-based practices and current needs, while adopting the lens of equity and sustainability throughout the entire methodological and implementation process.

Abstract citation ID: ckae144.439
Joining forces to accelerate cancer and NCD prevention in Europe

Knut-Inge Klepp

KI Klepp[1]
[1]Division of Mental and Physical Health, Norwegian Institute of Public Health, Oslo, Norway
Contact: Knut-Inge.Klepp@fhi.no

JA PreventNCD, a Joint Action to prevent cancer and other non-communicable diseases (NCDs) aims to assist authorities in prioritizing the most effective prevention strategies and policies to reduce the burden of cancer and NCDs, focusing on both personal and societal risk factors. A key objective is to tackle social inequalities by addressing the root causes of NCD risk factors and adopting a life-course approach. Recognizing that health is created by policies in several sectors is key when addressing health determinants, including social and commercial determinants of health. Consolidated efforts across countries will be required to tackle some of these determinants. To achieve the project's objectives, the JA PreventNCD will build a comprehensive European infrastructure for monitoring risk factors, disease burden, and the impact of policies and interventions. Rigorous evaluation will ensure that the project's deliverables will have an impact at local, national and EU levels. Three technical work packages address common risk factors for NCDs through actions ranging from policies and structural measures at societal level to interventions targeting individuals. Another set of cross-cutting work packages address monitoring, social inequalities, and health in all policies. More than 100 partners across 25 countries are involved, with almost 100 pilots to be conducted over the course of the project's four years. One way of ensuring sustainability of the project's outcomes is the building of a sustainable governance structure through the establishment of an EU Consortium on Cancer Prevention. Furthermore, as a mechanism to ensure high policy relevance of this JA, a Policy Decision Maker's Forum will be established to engage policymakers and ensure feasibility of the project's recommended actions.

Arnfinn Helleve
Norwegian Institute of Public Health, Oslo, Norway

7.H. Round table: Advancing societal goals through health systems: Insights from the Renewed HSPA Framework

Abstract citation ID: ckae144.440

Organised by: European Observatory on Health Systems and Policies
Chair persons: Rachel Greenley (UK), Dheepa Rajan (Belgium)
Contact: rachel.greenley1@lshtm.ac.uk

The purpose of this workshop, entitled 'Advancing societal goals through health systems: Insights from the renewed HSPA framework,' is to take a deeper look at the intricate relationships between health systems and broader societal objectives. We will dissect the contributions of health systems to societal well-being, a concept that stretches beyond mere economic growth to include social cohesion, environmental sustainability, and economic development. The session will examine the renewed global Health System Performance Assessment Framework, which serves as a tool for policymakers to better understand how health systems fit together and explains how they perform. This framework allows for a clearer interpretation of health data and provides a pathway to pinpoint health system issues and design that are most likely to enhance performance and resilience. The workshop will delve into the three dimensions of societal well-being-social cohesion, economic development, and environmental sustainability-nested within the HSPA framework. We will explore the health system's role in advancing these dimensions, such as fostering community bonds, supporting economic growth through a healthy workforce, and contributing to the sustainable management of environmental resources. Integrating health system performance into societal goals is a practical obligation to create a resilient, cohesive, and economically robust society. This workshop will engage stakeholders in a discourse to translate this integration into multisectoral and actionable policies, aligning health system goals with societal aspirations for a sustainable future. This workshop will focus on: How health system assessments can capture contributions to societal goals, underpinning sustainable economic and environmental practices. Real-world case studies showcasing health systems' role in fostering societal well-being and advancing public health policies. Interactive discussions will shed light on how health systems can be pivotal in achieving the Sustainable Development Goals, particularly in the face of modern challenges such as climate change, demographic shifts, and economic pressures.

Key messages:

- Health systems play a pivotal role in advancing societal well-being beyond traditional health outcomes.
- The renewed HSPA framework is a robust tool for policymakers to align health system performance with broader societal goals.

Speakers/Panelists:

Scott Greer
University of Michigan, European Observatory on Health Systems and Policies, Ann Arbor, USA

Andrea Schmidt
Austrian Public Health Institute, Vienna, Austria

7.I. Skills building seminar: Beyond the jargon: an interactive workshop for effective risk communication

Abstract citation ID: ckae144.441

Organised by: EUPHAnxt, EUPHA-EPI, Sciensano (Belgium)
Chair persons: Jinane Ghattas (EUPHAnxt), Angelo Maria Pezzullo (EUPHA-EPI)
Contact: jinane.ghattas@sciensano.be

Risk communication plays a central role in epidemiology to provide information for disease surveillance and outbreak control. It is one of the of the eight core functions that WHO Member States must comply with as part of the International Health Regulations (2005) ensuring national and global preparedness for health threats. It refers to the timely and accurate exchange of information between public health experts or authorities and individuals who are confronted with a threat to their survival, health, economic or social well-being. At its core, risk communication is about empowering people exposed to a risk to make well-informed decisions in order to mitigate potential risks and adopt preventive actions and measures. Risk communication considers political, social, and economic factors; it analyses risk and risk perception; and it places a great emphasis on dialogue with impacted and targeted populations to help them make the best decisions they can. Therefore, it requires an understanding of stakeholders' perceptions, concerns, and beliefs, as well as their knowledge and practices. In the context of the COVID-19 pandemic, the need for effective and efficient risk communication has become even more evident than before. Risk communication should be able to recognise and deal with rumours and disinformation, and reach the most vulnerable groups, who have a higher risk of contracting the virus and suffering from COVID-related consequences. Lately, increasing attention has been given to this topic. The WHO set-up, in April 2023, a technical Advisory Group for Risk Communication, Community Engagement and Infodemic management (TAG-RCCE-IM) to provide independent review and technical advice in the context of emergency preparedness and response in Europe. The Joint Action PreventNCD aims to also build a framework for country-specific communication strategies for non-communicable diseases (NCD) patients in health crises in one of the Work Packages, by collecting and analysing health communication strategies in different European countries targeting NCDs. In this interactive skills-building seminar, we will share with the participants the knowledge, skills, and process of effective risk communication by using case studies from experts in the field. The session will start with a presentation on the core elements of risk communication followed by examples from the field. This workshop will foster an inclusive interactive environment where participants will hear from panellists sharing their experiences from different settings such as international organisations and national public health institutes. Participants will be split into groups and will be provided with a piece of scientific output, such as a research study or epidemiological report and encouraged to translate this technical message into a clear, concise message that can effectively communicate the key points to the general public.

Key messages:

- Risk communication is essential to fight disinformation while empowering the public to make informed decisions related to their health and well-being.
- Epidemiologists and researchers should be encouraged to employ efficient and targeted communication strategies when disseminating their findings.

Speakers/Panelists:

Stefan Schaub
Bundeszentrale für gesundheitliche Aufklärung (BZgA, Cologne, Germany
Federica Rossetti
Sciensano, Brussels, Belgium

7.K. Round table: Approaching new public health frontiers: health literacy on a global level

Abstract citation ID: ckae144.442

Organised by: EUPHA-HL, -PHMR, WHO, WHO Collaborating Centre for Health Literacy, Technical University of Munich (Germany), Global Health Literacy Academy (Denmark), Sciensano (Belgium)
Chair persons: Orkan Okan (EUPHA-HL), Nienke Schutte (Belgium)
Contact: orkan.okan@tum.de

This workshop will introduce the newly established WHO Collaborating Centre for Health Literacy (WHO CC HL) at TU Munich (TUM) in Germany and reflect on its goals and discuss the potential impact on European public health research, policy, and practice. With the launch of the WHO CC HL, TUM, WHO, and their collaborators, among which are the EUPHA Health Literacy Section, the International Health Literacy Association, and the Global Health Literacy Research Network, jointly aim at systematically developing health literacy as part of the WHO Sustainable Development and Well-being agenda. Health literacy represents the skills and attitudes to find, understand, appraise, and apply health information and services. Low health literacy is prevalent among all population and age groups and it is linked to worse health outcomes and health inequalities. Across the social gradient, people from low socioeconomic backgrounds are more likely to have low health literacy, which is why the European Commission and WHO both highlighted the need to invest in health literacy and, in particular, in school health literacy. Two emerging fields of study include data generation and interventions. Both of which are highly critical to monitoring change and providing evidence-based data on population and system-level health literacy within and between countries. However, there are no health literacy monitoring systems in place on a global scale nor is there robust evaluation data on school-based interventions. These shortcomings will be addressed through the WHO CC HL at TUM. In this round table workshop with five key health literacy and public health experts, the main goal is to present the WHO CC HL and its roadmap for the next four years and critically discuss how the work can influence European and Global public health: Dr. Faten Ben Abdelaziz, WHO; Anastasia Kyoylu, WHO/Europe; Dr Kristine Sorensen, Global Health Literacy Academy; Dr. Charlotte Marchandise, EUPHA; Prof. Dr. Orkan Okan, WHO Collaborating Centre for Health Literacy at Technical University of Munich.

First, the chair will provide a short introduction to the WHO CC HL and will, together with the co-chair, facilitate the following panel discussion. The panel members will share a short 2-to-3-minute statement from their point of view in relation to planned activities of the WHO CC HL and highlight synergies to public health and health literacy development. Following the short statement, the chairs will prepare individual questions for each panellist and engage them in a discussion, which shortly after will open towards the audience for them to participate actively with the panellists in a 30-minutes discussion.

Key messages:

- The round table workshop will introduce the newly established WHO CC HL, highlight its goals and impact on public health, and highlight collaboration opportunities.
- The key experts will reflect about the WHO CC HL from their unique standpoints and reveal new perspectives on the way forward and how the work can benefit from ongoing public health initiatives.

Speakers/Panelists:

Faten Ben Abdelaziz
WHO, Geneva, Switzerland
Anastasia Koylyu
WHO, Copenhagen, Denmark
Kristine Sørensen
Global Health Literacy Academy, Risskov, Denmark
Charlotte Marchandise
EUPHA
Orkan Okan

7.L. Practice session: Is there an investment case for health at older ages?

Abstract citation ID: ckae144.443

Organised by: European Observatory on Health Systems and Policies
Chair persons: Jonathan Cylus (WHO)
Contact: jvasco.santos@gmail.com

The global demographic landscape is undergoing significant transformation due to increases in longevity and declining birth rates. According to the United Nations, the world's population aged 65 and over is projected to more than double, reaching over 1.5 billion by 2050, while global fertility rates are expected to decline to 2.4 births per woman by 2030 and continue decreasing to 2.2 births per woman by 2050. Ageing populations have frequently concerned decision-makers due to the potential implications of changes in population age-mix for labour markets and the economy, as well as for the sustainability of public programs and spending, particularly the health sector. For example, as the share of the population at older age increases, there are concerns over how to cope with the possible economic implications of having a smaller share of people at traditional working age (with potentially more people obtaining income security through both public and private pensions) and how to respond to greater health and long-term care needs. Without appropriate policy responses, there are worries that demographic changes will have inevitable consequences for households, public finances and possibly for economic growth and development. To support policy decisions related to population ageing it is important to have informative evidence and modelling tools that allow policymakers to better understand both the implications of population ageing as well as the consequences of policy action or inaction. To this end, this session presents three recently developed modelling tools that aim to address a number of policy relevant questions related to ageing:

1) How does ageing affect health financing and are health systems unsustainable?

2) How does ageing affect economic objectives and does health at older ages matter?

3) Can we develop economically relevant measures of health at older ages if older people do not have formal ties to the labour force?

Using data and analyses from a range of European countries, we will demonstrate empirically that the way ageing affects health financing systems, economies, and societies more broadly reflects policy choices and is not an inevitable consequence of demographic changes.

Key messages:

- Policymakers must prioritize informed policies to comprehensively understand the impact of aging on health financing and economies, facilitating the development of sustainable solutions.
- Immediate action is imperative to address the implications of aging on labor markets and public spending, ensuring future economic stability and safeguarding societal well-being.

Abstract citation ID: ckae144.444
Population ageing and health financing: A method for forecasting two sides of the same coin

Gemma Williams

G Williams[1,2]
[1]European Observatory on Health Systems and Policies, London, UK
[2]LSE, London, UK
Contact: G.A.Williams@lse.ac.uk

There is a perception that population ageing will have deleterious effects on future health financing sustainability. Given the positive association between health care utilization and increasing calendar age, many analysts assume population ageing will result in considerable growth in health spending. Since this expenditure tends to be sourced primarily from public funds, there is great policy interest to quantify how population ageing is likely to affect health expenditure trends. We propose a new method-the Population Ageing financial Sustainability gap for Health systems (or alternatively, the PASH)-to explore how changes in the population age mix will affect health expenditures and revenues. Using a set of six countries in Europe and the Western Pacific representing a diverse range of health financing systems (Australia, Bulgaria, Japan, Slovenia, United Kingdom, Vietnam), we forecast the size of the ageing-attributable gap between health revenues and expenditures from 2020 to 2100 under current health financing arrangements. The largest gap by 2100 is expected to be in Vietnam, where the gap between revenues and expenditure is expected to increase by around $170 per person in 2018 PPPs or 2.3% of GDP; 87.1% of this increase is due to expected growth in expenditures. In Slovenia, where the gap is forecast in line with the forecast for Japan (the oldest country in the world), nearly half of the gap (44.2%) is due to reductions in revenue generation. All countries face some health financing gap due to ageing under current financing arrangements. The PASH analysis highlights the wide range of policy options available to manage health financing as the population ages, such as changing sources for health revenues and reducing expenditure by promoting healthy ageing.

Research often suggests that population ageing will be detrimental for the economy due to increased labour market exits and lost productivity, however the role of population health and disability at older ages is not well established. Identifying whether the health of older people affects economic outcomes is challenging due to methodological issues. Using country-level panel data, we estimate the relationship between the size of the older working age population (aged 55-69) and economic growth across 180 countries from 1990 to 2017. We run models using annual data and 5-year moving averages of real per capita GDP growth as dependent variables. This enables us to quantify the gains in real per capita GDP growth associated with a healthy older working-age population on a country-by-country basis. The initial models confirm an inverse-U or hump-shaped relationship between population age groups and economic growth. In the 5 year average GDP growth model, the coefficient for the inverse of YLDs among 55-69 year olds is positive and significant at $p < 0.01$. The interaction term is significant at $p < 0.001$ in the same model. Across all countries, a 5% improvement in YLDs is associated with at minimum 0.3% predicted additional annual real per capita GDP growth. While a larger share of the older working-age population at ages 55-69 has historically been associated with slower real per capita GDP growth, low levels of disability in this age group can reduce or even eliminate these adverse economic effects. We consistently find a significant positive interaction between disability and the share of the population at ages 55-69, suggesting that adverse economic effects are amenable to policy intervention.

While health naturally has intrinsic value and maintaining health as people age seems to make good economic sense, making the case for investing in health at older ages can be challenging. Much economic growth is historically attributed to the working-age population; however, maintaining good health as people age also enables older

people to contribute meaningfully to the economy. Investing in health at older ages, therefore, can be strategic economic policy. We develop a novel method to quantify the economic value of health through time use data. Using data from the United Kingdom Time Use Survey (UKTUS) 2014-15 for individuals aged 65 years-old and older, we apply survey-weighted generalized linear models to predict the time spent in non-market productive activities based on age and self-perceived health. We then quantify the monetary value of time spent engaging in these activities and simulate the monetary impact of health gains at older ages. Both age and self-perceived health status were associated with minutes spent in many non-market productive activities. Being in 'very good' instead of 'very bad' self-perceived health is associated with an additional production of 439£, 629£, and 598£ per month for an average individual aged 65 to 74 years-old, 75 to 84 years-old, and 85 years-old and older, respectively. Our simulation model indicates that improving the health of 10% of older people in 'very bad' health could lead to an economic increase of up to 278£ million through non-market activities. Health at older ages creates considerable economic value which is not captured using standard national accounting measures. Our work highlights the importance of health for functional capacity as people age, allowing them to engage more in non-market activities. Our method to quantify the monetary value of health can be adapted to other settings to make the economic case for investing in healthy ageing.

7.M. Round table: A new lens on loneliness: leveraging the built environment for social health

Abstract citation ID: ckae144.447

Organised by: Manchester Institute of Education (UK), DEFACTUM (Denmark)
Chair persons: Nina Goldman (UK)
Contact: nina.goldman@manchester.ac.uk

Loneliness is a global issue impacting a third of all adults, with young adults (15-25 years) disproportionately affected. Prolonged loneliness has serious consequences for mental and physical health and should be addressed as a matter of urgency. The built environment, where we live, work, and socialise, is increasingly recognised as a significant factor influencing loneliness. However, existing interventions often focus on older adults and neglect the role of the built environments in promoting connectedness across the life course. To bridge this gap, we need interdisciplinary collaboration to understand how our environments and communities can mitigate loneliness. This workshop will explore the critical intersection of place and loneliness interventions. The three panellists bring unique interdisciplinary expertise on loneliness ranging from policy to intervention implementation. These three talks (10min each) will set the stage for a dynamic discussion (30min):

1. Nina Goldman, commissioned by the World Health Organization to undertake a global overview of national loneliness policies, will present findings on how national strategies integrate place-based strategies across sectors such as housing, transportation, and urban planning.
2. Mathias Lasgaard, leading researcher on loneliness interventions, will present the innovative 'More Together' (MoTo) project - a multifaceted intervention addressing loneliness in both young and older adults within the Silkeborg Municipality, Denmark. This presentation will contextualize MoTo within the broader landscape of targeted loneliness interventions.
3. Eric Schoenmakers, advisor of the national loneliness action program in the Netherlands, will introduce the "I BELONG" project, an international network dedicated to understanding the relationship between public spaces, loneliness, and effective interventions for young adults in the Netherlands.

Key messages:

- We aim to stimulate a paradigm shift in the way we address loneliness by moving beyond individual-centred solutions to develop a more holistic and community-based approach.
- We need more interdisciplinary collaboration to understand how our environments and communities can mitigate loneliness.

Speakers/Panelists:

Nina Goldman
University of Manchester, Manchester, UK
Mathias Lasgaard
Defactum, Central Denmark Region, Aarhus, Denmark
Eric Schoenmakers
Fontys University of Applied Sciences, Eindhoven, Netherlands

7.N. Round table: Social media & smartphones: Threats to child & adolescent health and public health solutions

Abstract citation ID: ckae144.448

Organised by: EUPHA-CAPH
Chair persons: Sonia Saxena (EUPHA-CAPH), Julia Dratva (Switzerland)
Contact: john.gannon03@gmail.com

The daily lives of children and adolescents in 2024 are heavily influenced by social media and smartphones, which is unprecedented in previous generations. While this technology offers undoubted benefits, there is strong evidence on the negative effects of social and cognitive development of infants and primary school aged children, and mental health impacts in adolescents including depression, anxiety, sleep disruption, addictive behaviours and self-harm. Internet companies are financially incentivised to maximise screen time of users to generate advertising revenue, and more time spent by young people on these devices in a largely unregulated online domain increases risk of consequences like bullying and harassment, body dysmorphia, gambling addiction, porn addiction, sexual predation and suicide. Comprehensive solutions are urgently needed to regulate the activities of social media and tech companies and support young people to protect themselves from serious harms. Governments have been slow to introduce policies such as smartphone bans or enhanced privacy laws, perhaps because they are perceived as unpopular infringements on the rights of adult users and/or due to a potential detrimental effect on commercial interests. Guidance can be disseminated to young people, schools, families and institutions on how to reduce screen time and smartphone addiction, and improve coping and self-regulation to mitigate these risks. Information campaigns with positive health messages in this area, to compete with the advertising dominance of social media companies, are another opportunity to improve behaviours and reduce adverse health effects. The objectives of this round table workshop are to share examples of strategies, guidance and policies from across Europe, and discuss with the audience how the public health community can collaborate to tackle this problem. Members of the EUPHA Child and Adolescent Public Health (CAPH) section will outline the latest available evidence on the negative impacts of social media and screens, present examples of innovative public health responses and strategies to protect children, and engage conference participants for their input and discussion. Five panellists will present. First, John will start with a quiz of the audience which will include presentation of current data and trends relating to social media and smartphone usage. The second presentation by Cecilia will highlight in detail evidence of both benefits and adverse effects of these technologies in the lives of young people. The third speaker Karin will discuss examples of effective policies to reduce this impact, with a focus on the role of schools. The fourth speaker Jean will give further examples of public health actions, and share recommendations directly from children and young people. The fifth panellist Silja will re-quiz the audience, to gauge the reaction and support of solutions that were covered, and this will lead into the interactive discussion.

Key messages:

- Popularity of smartphones and social media has increased dramatically in recent years, particularly among minors, with significant impacts on mental and physical health.
- Public health solutions are urgently needed, and this workshop will share examples of effective innovative responses in European contexts, followed by an interactive audience discussion.

Abstract citation ID: ckae144.449
Introduction to round table panel discussion and audience quiz

John Gannon
Department of Public Health Area C, Health Service Executive, Dublin, Ireland

Dr. John Gannon is a Public Health Specialist Registrar with HSE Ireland. He has a background working in clinical paediatrics in Ireland, Australia and Zambia. John will introduce the workshop and begin by quizzing the audience using an interactive online tool, to evaluate their perceptions and understanding of the current landscape of screen usage and social media among children and adolescents. In this presentation, he will relay statistics on these metrics and the dramatic upsurge in recent years. He will also touch on the financial implications of these trends for global tech giants.

Abstract citation ID: ckae144.450
Screen time and social media exposure in children and adolescents - the landscape

Cecília Elias
Faculty of Medicine, University of Lisbon, Lisbon, Portugal

Dr. Cecilia Elias is a Public Health Consultant, collaborating with the Infant, Youth, Sexual and Reproductive Health Division at the Health Directorate General, in Lisbon, Portugal. Following on from John's introduction, Cecilia will dig deeper into the impacts of the omnipresence of social media and phones in modern society. She will provide an overview of the harms and benefits for today's youth. She will highlight data for example on impaired development of language, cognitive and social skills from screen exposure at young ages, and increased rates of depression, anxiety, self-harm, and school refusal among adolescents with problematic social media usage, including examples of significant outcomes. Exposure to disturbing and harmful content on social media platforms like TikTok and Instagram will be covered also.

Abstract citation ID: ckae144.451
Ban on mobile phones in the classroom: first (positive) effects

Karin Boode
Youth Department, National Association of Regional Public Health, Randstad, Netherlands

Karin Boode MBA is Strategic Youth Policy Advisor and working at the National Association of Regional Public Health Services Netherlands. Leading on from the presentation on the harms of social media and smartphones, Karin will present examples of policies that have been successful in reducing the health impacts on youngsters. She will focus on the role of schools in addressing this problem, and how public health organisations can effectively disseminate guidance to teachers and parents in limiting screen time and improving self-regulating behaviours of children and adolescents to minimise screen and smartphone addiction. Karin will also explore controversial legislation such as smartphone bans.

Abstract citation ID: ckae144.452
Social media use in children and young adults: the Malta experience

Jean Calleja-Agius
Faculty of Medicine and Surgery, University of Malta, Msida, Malta

Prof. Jean Calleja Agius MD PhD is Professor at Faculty of Medicine and Surgery at the University of Malta. Jean will demonstrate further examples of interventions to make the internet safer for young people, drawing on her experience of collaborating with the Children and Youth Council within the Malta Foundation for the Wellbeing of Society (MFWS), which in turn is affiliated with EUROCHILD. She will share the outcomes of initiatives which have been carried out within MFWS and outline recommendations made directly by children and adolescents. More stringent regulation of social media companies will be addressed, as well as the need for other measures to engage children in other healthier activities and empower them to opt for the right choices.

Abstract citation ID: ckae144.453
Summary of presentations and urgent call to action

Silja Kosola
Adolescent Medicine, University of Helsinki, Helsinki, Finland

Dr. Silja Kosola MD PhD is Associate Professor of Adolescent Medicine and primary investigator with the University of Helsinki, Finland, and Research Director at the Western Uusimaa Wellbeing Services County in Southern Finland. As the concluding presentation, Silja will quiz the audience again with the online tool, this time to gauge the responses and support of the solutions that have been outlined. She will present a summary of the points raised, and this will then lead into the interactive discussion about the call to action.

7.O. Skills building seminar: Initiating change: Mainstreaming equity and diversity in public health

Abstract citation ID: ckae144.454

Organised by: JACARDI, EUPHA-MIG
Chair persons: Bernadette Kumar (EUPHA-MIG)
Contact: natalia.skogberg@thl.fi

Background: Consideration of the increasing population cultural and ethnic diversity and the widening of social gaps is essential for narrowing health inequities. While tailored and targeted measures for populations at risk of social disadvantage are needed, mainstreaming and integration of diversity and inclusion perspectives in all public health measures are required. To our knowledge, the EU Joint Action for Cardiovascular diseases and diabetes (JACARDI) is the first large-scale program to apply a systematic and harmonized approach for integrating equity and diversity perspectives.

Objectives: The main objective of the workshop is skills building in integration of equity and diversity perspectives in practice through:

1) Introducing the key requirements for achieving EU-wide programme change, drawing from several decades of experience in projects conducted in over 30 countries, including those partnered with the World Health Organization, governments and industry.

2) Outlining a practical tool in the format of an equity and diversity matrix designed for integrating equity and diversity perspectives developed within the JACARDI project to support implementation of 142 sub-projects in 21 partner countries.

3) A practical participatory group work based on the JACARDI equity and diversity maturity matrix, followed by a moderated discussion.

The workshop acts as a valuable platform for sharing and building collaborative knowledge across European countries and empowering participants as initiators for sustainable, more equitable, and diversity inclusive public health actions. It provides practical and concrete skills on equity and diversity that participants can apply in their work and disseminate within their organizations. The presentations will build knowledge, while group work and the moderated discussion will build skills among participants on the workshop topic.

Format of the workshop: Two presentations followed by participatory group work and a moderated discussion among workshop participants and presenters.

Key messages:

- Population diversity should be systematically mainstreamed in public health to effectively and sustainably narrow persisting health inequities.
- An equity and diversity maturity matrix can be used as a practical tool for systematic integration and monitoring of diversity perspectives in practice.

Abstract citation ID: ckae144.455
Equity and diversity maturity matrix for structured diversity inclusion in the EU JACARDI project

[6]Centre for Global Health and Equity, School of Health Sciences, Swinburne University, Hawthorn, Australia
[7]University of Copenhagen, Copenhagen, Denmark
[8]Sante Publique France, Paris, France
Contact: natalia.skogberg@thl.fi

Issue: There is increasing awareness on the importance of integration of cultural and ethnic diversity perspectives to reduce prevailing health inequities effectively and sustainably. There is, however, limited experience and practical tools for systematic integration of these perspectives in public health.

Description of the problem: The EU Joint Action for Cardiovascular Diseases and Diabetes (JACARDI) project, conducted 11/2023-10/2027 has developed a structured and systematic approach for integrating equity and diversity perspectives in all its 142 pilots across 21 European countries.

Results: Equity and diversity perspectives are embedded in the harmonized stepwise methodology for pilots, supported with a practical Equity and diversity maturity matrix. The maturity matrix is based on the JACARDI 4Cs Equity and diversity explanatory framework (Critical reflection; Context and data; Co-design; inclusive and accessible Communications). The content of the matrix is divided into concrete steps related to pilot's planning and implementation, each with three levels of maturity that aim at gauging how equity and diversity perspectives are applied in practice: Approaching, Meeting, Exceeding. Pilots are encouraged to strive for any of these three levels, considering their available resources and previous experiences in diversity inclusion.

Lessons: Effective and sustainable change toward more equitable and diversity inclusive practice requires seamless integration of these perspectives in other routine activities. Training and continued practical and motivational support are key for adherence to novel approaches. In addition to being a practical tool, the Equity and diversity matrix acts as a structured self-evaluation tool to monitor how equity and diversity principles are translated into practice.

Abstract citation ID: ckae144.456
Key requirements for achieving EU-wide programme change

Richard Osborne

R Osborne[1,2,3]
[1]Centre for Global Health and Equity, School of Health Sciences, Swinburne University, Hawthorn, Australia
[2]University of Copenhagen, Copenhagen, Denmark
[3]Sante Publique France, Paris, France
Contact: rosborne@swin.edu.au

Issue: Across the world, thousands of projects aim for equitable improvement in health for people who are experiencing ongoing avoidable stigma, discrimination and disadvantage however very little change is often achieved.

Description of the problem: In this presentation we explore key requirements for project-level change to ensure EU-wide programme change is achieved.

Results: The two most common causes of project failure are a) the innovation is not suitable, needed or wanted (also called theory failure) or b) implementation failure. This presentation shares strategies to mitigate risks of project failure through co-design processes and communication, drawing from 30 years of experience from the entire implementation process from ideation to scale up. These experiences include projects from over 30 countries, including partnerships with the World Health Organization, governments and industry focused on health literacy, self-management, care pathways, workplace health, hospital services redesign, First Nations health and migrant health. Common success factors include balancing top-down needs with co-designed inputs and with previous preferred or good practice (which may have come from controlled trial evidence generated in different contexts). The intervention must co-implemented to serve stakeholder's needs at all levels, from citizens to decision makers.

Lessons: The United Nations (UN) and private sector apply system-wide approaches to affect large scale change. This knowledge is valuable for large public health programmes aiming to integrate equity and diversity in project processes to minimize implementation failure.

7.P. Skills building seminar: Using health impact assessment for assessing tobacco control policies

Abstract citation ID: ckae144.457

Organised by: European Burden of Disease Network, EUPHA-HIA
Chair persons: Brecht Devleesschauwer (Belgium), Piedad Martin-Olmedo (EUPHA-HIA)
Contact: Brecht.Devleesschauwer@sciensano.be

Tobacco use is the largest contributor to premature death and preventable disease in Europe. Despite decreasing tobacco use in recent years, the European Commission estimates that the number of smokers in Europe is 26% in the population, and 29% among 15-24 year olds. This persistent public health risk is amenable to policy, but targeted and effective strategies are needed. Health impact assessment (HIA) methods can aid decision-makers in exploring the consequences of policy actions on select outcomes, providing a platform for informed, evidence-based policy design. Routine data collection on risk factors including smoking and tobacco use behaviour is common and available in Europe. Analysing and valorising these data can provide a better picture of vulnerable and target groups for which tobacco use is a persistent problem, or where the attributable disease burden is particularly high. These data can form the basis for robust projections and the application of HIA methods. In addition, a number of policy strategies exist for tobacco control including changes in packaging, taxation, labelling, ingredients, creation of smoke-free environments, and restrictions on advertising. These policies have a common goal in improving tobacco control, but may lead to differential effects across age groups, populations, and different measures of tobacco use. It is thus necessary to use robust tools to understand these effects and better coordinate and plan policy. HIA methods, each with their own strengths and limitations, have been applied successfully to estimate the impact of different tobacco control measures. Novel methodologies that make use of available data, computational power, and provide a low-cost way to explore policy interventions can be an essential tool to policy planning and in particular to tackle the intractable areas of tobacco control. This skills building workshop will present two key approaches, each with their own strengths and weaknesses, that have been applied in HIA studies on tobacco control - i.e., a static approach based on the calculation of potential impact fraction, and a dynamic approach based on microsimulation models. Furthermore, the workshop will demonstrate, using two real-life examples, how policy measures can be translated into effect size estimates - which is one of the most crucial steps in any HIA. By providing a step-by-step presentation of how HIA has been applied in practice, attendees will gain unique insights in the different ways by which HIA can be used to gain insights into the relative impact of policy strategies for tobacco control.

Key messages:

- Tobacco use remains the largest contributor to preventable disease burden in Europe; a key area for analysing policies using health impact assessment.
- Attendees will gain unique insights in the different ways by which HIA can be used to gain insights into the relative impact of policy strategies for tobacco control.

Abstract citation ID: ckae144.458
Calculating potential impact fractions to assess the impact of tobacco control policies

Ute Mons

U Mons[1]
[1]Medical Faculty and University Hospital, University of Cologne, Cologne, Germany
Contact: ute.mons@uk-koeln.de

This presentation will provide a straightforward and accessible method for evaluating the effectiveness of various tobacco control policies in reducing the smoking-associated disease burden. To estimate numbers and proportions of potentially avoidable disease cases under different policy intervention scenarios (such as cigarette tax/price increases, comprehensive marketing ban, and plain packaging), this approach entails the calculation of age- and sex-specific potential impact fractions, representing the percentage change in disease risk following changes in exposure to smoking. The approach can account for lag and latency periods between reductions in smoking prevalence and declines in disease excess risks. The future disease burden is estimated by combining data on the incidence or mortality of the disease of interest, published effect sizes of tobacco control policies, and national smoking prevalence data. Intervention scenarios are compared against a status quo scenario that assumes the continuation of recent smoking trends. The presentation will outline the approach, using the example of smoking-associated cancer, and discuss model assumptions, required data, and sensitivity analyses. This straightforward modelling framework enables the comparison of different health policy measures' impacts, providing valuable insights for policymakers and public health officials regarding the potential public health impact of tobacco control policy measures.

Abstract citation ID: ckae144.459
DYNAMO-HIA: A health impact assessment tool fit for quantifying tobacco control policy

Stefan Lhachimi

S Lhachimi[1]
[1]Department Health Sciences, Nursing and Management, University Neubrandenburg, Neubrandenburg, Germany
Contact: Lhachimi@hs-nb.de

DYNAMO-HIA is a generic, publicly-available and easy to use software tool for health impact assessments of changes in health risk-factors such as obesity, air pollution, processed meat consumption, physical activity, alcohol taxation, or smoking. The tool uses a graphic use interface, does not require programming skills, and has comparatively modest data requirements. Health outcomes that can be investigated are mortality, life expectancy, healthy-life expectancy, disability and prevalence of various chronic disease such as chronic obstructive pulmonary disease (COPD), cancer, or coronary heart diseases. DYNAMO-HIA can in principle be used for any tobacco control policy or ordinance-e.g. price increases or pictorial health warning labels-that target changes in smoking prevalence or smoking initiation/quitting rates. Past applications of DYNAMO-HIA for tobacco control policy included country studies for Belgium, Mongolia, or Korea and several comparative country studies. In this presentation we will give a general overview into the use of DYNAMO-HIA and show-case a recently published study. This study quantified the reduction in COPD burden that would occur in Italy, England and Sweden over 40 years if tobacco prices were increased by 5%, 10% and 20% over current local prices.

Abstract citation ID: ckae144.460
Populating HIA of tobacco policies with empirical evidence on behavioral response to price increases

[4]Erasmus School Health Policy and Management, Erasmus University Rotterdam, Rotterdam, Netherlands
Contact: ardine.de.wit@rivm.nl

Performing Health Impact Assessment of tobacco policies requires to have insights into how smokers will react to policy measures such as price increases. In the Netherlands, a series of 3 substantial price increases has been implemented in 2020 (10% increase), 2023 (10% increase) and 2024 (24% increase). We performed three consecutive studies comparing the ex-ante stated preferences about behavioural response to actual and hypothetical future price increases, and compared these stated preferences with actual behaviour changes 6 months after the increase in excise tax. Two of these possible behavioural reactions actually will impact smoking prevalence or smoking intensity, e.g. stopping altogether and decreasing the number of cigarettes smoked. Other behavioural responses are less favourable and will not impact health, such as buying more and cheaper tobacco abroad and smoking less expensive brands or transferring from cigarettes to roll-your-own or e-cigarettes. For the price increases of 2020 and 2023, we have observed a substantial number of about 10% of smokers quitting successfully and about one third attempting to quit smoking. (Attempting to) quit smoking was much more prevalent among those with a more pronounced intention to stop smoking at the ex-ante measurements. At the same time, cross-border shopping increased significantly as well, with a 10 percent-point growth in the absolute amount of all tobacco consumed originating from abroad following the 10 percent price increase of April 2023. This big increase in cross-border shopping appeared to be independent of distance to the border. We conclude that every significant price increase stimulates smokers to consider to stop smoking. However, unilateral price increases in one country will eventually also stimulate smokers to buy cross-border. Behavioural data as presented should inform HIA to make them more realistic with regard to actual behaviour changes and health impacts of smoking policies.

Abstract citation ID: ckae144.461
Mind the gap: from real-world policies to health impact assessment modelling

Sarah Croes

S Croes[1]*, B Devleesschauwer*[1,2]*, V Gorasso*[1]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]Department of Translational Physiology, Infectiology and Public Health, Ghent University, Merelbeke, Belgium
Contact: sarah.croes@sciensano.be

When conducting health impact assessments (HIA), researchers often face the challenges of trying to align as closely as possible with policy scenarios. This phase concerns the translation of real-world policies into estimates usable in models. Most of the time, researchers need to address a policy-impact gap between what is needed by the policymakers and what is believed to be reliable data fitted for the model. These mismatches can stem from differences in how exposure and outcomes are studied compared to the policy plan. By looking at a case study of the planned Belgian policy to reduce tobacco selling points, challenges during the pre-modelling phase were identified. The question of what an effect size should be and its importance in the HIA process were considered fundamental for the analysis. In particular, literature on exposure to tobacco sales points differed in outcomes, as it would target proximity to someone's home, while the policy itself focuses on the reduction of points of sale of a specific store type. Similarly, smoking behaviour can be measured in various ways, such as initiation, cessation, relapse rates, or overall smoking prevalence. The policies' effect on these various outcomes differed significantly. In this presentation, the discussion will focus on the alignment of the existing literature with the specific details outlined in the policy. We will explore the challenges that arose when existing research criteria and assumptions did not fully match the policy, taking the new Belgian tobacco plan as an example. Lastly, we will highlight the opportunity to set up monitoring systems to evaluate tobacco interventions to extract reliable estimates for HIA and strengthen evidence-based tobacco policies in the future.

7.Q. Round table: Developing public health workforce in the European Region. Cases of Ukraine, Georgia, and Azerbaijan

Abstract citation ID: ckae144.462

Organised by: WHO/Europe, WHO Country Office in Ukraine
Chair persons: Emilia Aragon De Leon (WHO/Europe), Kasia Czabanowska (ASPHER)
Contact: aleksandrovao@who.int

In the dynamic landscape of public health, World Health Organization Regional Office for Europe (WHO) and the Association of Schools of Public Health in the European Region (ASPHER) have devised the European competency framework and the roadmap to professionalizing public health workforce (PHW) in the European region aiming to guide stakeholders with competency standards and actionable recommendations for strengthening PHW. This workshop presents actions taken in Azerbaijan, Georgia, and Ukraine to strengthen their public health workforce, showcasing how mentioned tools can be effectively applied in different contexts. The workshop aims to equip participants with practical strategies and tools to enhance the professionalization of the PHW, ultimately contributing to improved public health outcomes across the region. In Ukraine, public health system faces multifaceted challenges, ranging from epidemics to war. In 2019, Ukraine piloted a Competency Framework with key stakeholders, incorporating competencies missing in job descriptions for public health specialists. Subsequently, a review of educational programs for master's degrees in public health was conducted. Based on the Competency Framework, the first state qualification exam for master's in public health was introduced in 2021. Guided by the Roadmap, a PHW situational analysis was conducted by the WHO Country Office, and the elaboration of a national programme for the PHW development is close to completion. Furthermore, recognizing the need for capable public health leaders, a national Public Health Leadership Programme has been initiated based on the Competency Framework. In Georgia, following global trends, in 2023 the Ministries of Internally Displaced Persons, Labour, Health, and Social Protection planned to prepare a comprehensive public health human resource strategy, based on the Competency Framework, which has led to the development of a number of policy processes and platforms, including a public health human resources survey to get a better understanding of the composition of the public health workforce in the country. In Azerbaijan, within the framework of the Azerbaijan Pandemic Response Project initiated in 2022, the WHO Country Office has actively sought to bolster the capabilities of the public health workforce. Utilizing the Competency Framework, a detailed self-assessment tool was developed, enabling both current public health professionals and students to evaluate their skills across various competencies. Alongside, a Professional Learning Plan was crafted to support a holistic learning cycle of Public Health Champions, which guides them through stages of identifying learning needs, engaging in relevant activities, and critically assessing the outcomes. Each presentation will offer valuable insights for European countries on how to strengthen public health workforce, how to adapt the tools to serve national priorities, and to foster collaboration among stakeholders.

Key messages:

- The workshop aims to equip participants with tools designed by the WHO and ASPHER to enhance the professionalization of the PHW across the region.
- The workshop will contribute to exchange of PHW professionalization practices at the European level by raising awareness among the audience of how the specific tools can be used in different contexts.

8.A. Scientific session: Engage, co-create, collaborate, transform: uniting practice and research for health innovation

Abstract citation ID: ckae144.463

Organised by: Maastricht University (Netherlands), University Hospital Ulm (Germany)
Chair persons: Sanne Gerards (Netherlands), Mathilde Crone (Netherlands)
Contact: lisa.harms@maastrichtuniversity.nl

Background: Public health practitioners are increasingly challenged by theoretical, political, and contextual changes and innovations. To ensure that innovations are sustainable, it is important not only to include stakeholders (e.g. end-users, implementers, policy-makers), but also to actively involve them in the development, implementation and transformation of public health innovations. Participatory action research, co-creation and stakeholder engagement are proven methods to co-produce effective innovations, strengthen existing networks and promote implementation by increasing fit and applicability in practice. In this workshop, our overall aim is to bring together practitioners and researchers to improve mutual understanding and adapt practices in development, implementation and transformation of innovations.

The objectives of the workshop are: 1) to increase participants' understanding of the circumstances under which stakeholder involvement is most meaningful, and 2) to increase participants' awareness of tools, strategies or theories to overcome challenges in stakeholder involvement.

Workshop format: The workshop consists of two parts: four interactive presentations that introduce important development steps of public health innovation and a problem-based discussion using a real-life case that builds upon the presentations. Interactive presentations describe (1) Theory of Change (ToC) approach for active collaboration with stakeholders, (2) co-creation of a serious game for and with healthcare providers, (3) visualising collaboration through Social Network Analysis to improve implementation, and (4) enhancing scale up with PRACTIS and Design Thinking. During the presentations, interactive tools are used to help identify the characteristics of the workshop participants (e.g. work setting, type of stakeholders), as well as their interests and needs (e.g. challenges faced, methods used). During the second part of the workshop, a health innovation is chosen from a number of pre-selected innovations from European contexts (e.g. BOB campaign, Schools4Health, LETHE) that aligns most with participants' background and interests. Next, the main goal and known challenges within these innovations are introduced, which aids participants to formulate intermediate goals using the ToC approach. Then, they answer questions and make decisions for the discussed stages of innovation development (e.g. "Which gaps exist in the current network and how can we address them to improve collaboration?", 'What scalability challenges exist in this innovation and how can PRACTIS help identify them?"). In answering these questions, participants will share their knowledge and expertise with each other, while the chair facilitates the discussion. We are flexible in the format of the challenge-based discussion; depending on the number of attendees, we may work with a plenary discussion or smaller groups that work independently under the supervision of 1 or 2 facilitators each.

Key messages:

- Non-linear approaches are needed to take into account the complicated and changing systems in which health innovation takes place.
- Theory of change, co-creation, social network analysis, PRACTIS and design thinking offer practical guidance for stakeholder involvement in specific phases of health innovations.

A method for interactive collaboration between different actors: theory of change workshops

Janine Wendt

J Wendt[1], *DA Scheller*[2], *A Müller-Stierlin*[3]

[3]Institute of Epidemiology and Medical Biometry, Ulm University, Ulm, Germany
Contact: janine.wendt@uni-ulm.de

It is well recognised that the involvement of different actors in health research is crucial to the success of projects and interventions, as it increases the likelihood that they will be relevant, impactful and applicable in practice. However, researchers and policy makers often lack tools for the participatory involvement of actors. One way of actively involving actors is the Theory of Change (ToC) method. A ToC is a model of a change process that describes how and why an intervention leads to the intended change or outcome in a given context. It describes the path along which change is expected to occur and provides a framework for investigating whether and how change takes place. It is a systematic methodology that can be used both prospectively and retrospectively for the planning, implementation and evaluation of interventions. The approach recognises that changes in socio-ecological systems are complex and challenging and that the causal processes are often non-linear and intertwined. A ToC workshop begins with the formulation of a clear vision for the desired change and the long-term goal of the intervention. Starting from the long-term goal, the necessary medium-term and short-term goals are then defined in a backward mapping process. Next, indicators, activities and assumptions are defined for each intermediate goal. The results of a ToC workshop can be visualised in a ToC map, which shows the causal pathways, relationships, and connections between the different components of the ToC. This visual representation helps the actors to understand the logic, connections, and assumptions underlying the ToC. This in turn facilitates a shared understanding, collaboration, and ownership among all actors involved. Overall, successful involvement of actors using the ToC method can not only enrich the research process, but ultimately also increase the health benefits of interventions and health policies.

Stakeholder involvement in the development of a serious game for and with healthcare professionals

Nils Keesmekers

Contact: nils.keesmekers@maastrichtuniversity.nl

Increasing pressure on the quality, accessibility and affordability of Dutch health services underlines the need for integrated approaches to healthcare that include lifestyle as preventive measure. Integrated healthcare requires coordinated collaboration between healthcare providers, which is facilitated by the concept of Positive Health as a unifying language. To support primary care providers (PCP) in developing knowledge and skills related to lifestyle as prevention, interdisciplinary collaboration and the concept of Positive Health, we are developing education in the form of a serious game: Game2Connect. Co-creation by active involvement of a consortium of educational institutes, healthcare organisations, a game developer, and PCP as end-users of Game2Connect plays a key role in its development. Data from interviews with PCP (on barriers and facilitators for health-promoting and collaborative behaviours), healthcare recipients (on input for case studies) and consortium meetings were incorporated into an initial version of Game2Connect, which is currently being piloted to assess and improve its utility and usability. Pilot sessions included an observed playthrough, followed by a usability questionnaire and a semi-structured group discussion. So far, 2 pilot sessions were held with consortium members ($n = 16$), and 3 sessions were held with PCP ($n = 22$). Learning indicators (e.g. PCP clarifying fellow players' misconceptions) were observed in all sessions. Usability scores indicate high levels of challenge, content relevance, and positive affect, ranging between 3.3-3.6 on a 4-point scale. Qualitative feedback from group discussions resulted in the development of new case studies to appeal to a broader range of PCP, and the adjustment of a goal-setting exercise as a game component to encourage its use. These results suggest that serious gaming may be a viable and engaging method to educate PCP, especially when developed in active collaboration with stakeholders.

Improving implementation of health interventions among ECEC organisations: a social network analysis

Sid Penders

M Leurs-Stijnen[2,3], *S Kremers*[1], *J Gubbels*[1]

[2]Department of Health Services Research, Care and Public Health Research Institute, Maastricht, Netherlands
[3]Living Lab Public Health Limburg, Public Health Service South Limburg, Heerlen, Netherlands
Contact: s.penders@maastrichtuniversity.nl

The environment wherein a child grows up determines many health and life outcomes of the child. The early childhood education and care (ECEC) is an important setting for children which offers possibilities for health promotion activities. A learning network with professionals from ECEC organisations in South-Limburg, the Netherlands is established, aimed at sharing health promotion 'best practices'. This study examined the network structure of the learning network and of ECEC locations regarding health topics such as nutrition, physical activity and sun protection. A mixed-methods design was adopted. An online-questionnaire was used to examine the relationships of the members of the learning network ($N = 6$) and ECEC locations ($N = 59$) between these organisations and with organisations related to the health topics. Data was analysed and visualised using a social network analysis (SNA) in UCINET. Thereafter, semi-structured interviews were held with the members of the learning network ($N = 6$), to discuss the network structure and possible improvements of the network. The SNA showed a weak network structure for the learning network and ECEC locations. Connections were mostly related to organisations in the field of nutrition and physical activity. This implied that health interventions related to sun protection and green environments were not implemented to the same extent as nutrition and physical activity. The interviews provided insight into the underlying reasons for (the lack of) certain connections. Overall, the members were satisfied with the quality and quantity of their current collaborations. The SNA and interviews indicated that the collaboration between ECEC organisations and organisations related to other health topics like green environment or sun protection could be improved. Therefore, it is recommended that ECEC organisations should engage in collaborations with organisations in these domains.

Involving stakeholders in planning the scale-up of a health promotion intervention: a practical example

Lisa Harms

L Harms[1], J Gubbels[2], S Gerards[2]
[1]Department of Health Promotion, Care and Public Health Research Institute, Maastricht, Netherlands
[2]Department of Health Promotion, Research Institute NUTRIM, Maastricht University, Maastricht, Netherlands
Contact: lisa.harms@maastrichtuniversity.nl

Scaling up health promotion interventions is complex. Despite the potential effects and impact on society, factors related to the intervention itself, potential adopters or implementers, and contextual factors can hinder or promote widespread scale-up. Frameworks such as the PRACTIS (PRACTical planning for Implementation and Scale-up) guide and approaches such as Design Thinking offer practical guidance for researchers to increase the likelihood for successful scale up. SuperFIT is an integrated intervention approach aiming to promote healthy energy balance-related behaviours in children aged 2-4 years. To date, SuperFIT has been implemented in over one hundred childcare locations, reaching at least 1800 children per day. A local PA-providing organisation is responsible for the implementation of SuperFIT. The aim of this project was twofold: to identify the needs of future adopters and implementers of SuperFIT (i.e. What information and materials do you need?) and to develop the relevant tools and implementation strategies. We used a co-creation approach, combining stakeholder interviews ($n = 6$) based on the PRACTIS guide to identify gaps and needs, with creative sessions (participants $n = 8$) and multiple thinking-out-loud sessions (participants $n = 6$) to generate solutions that would be relevant to implementers. Stakeholders included researchers with experience in SuperFIT and implementation science, implementers and managers of the current and new PA-providing organisations. Gaps were identified and summarised under three main themes: 1) a lack of clarity what SuperFIT entails, 2) SuperFIT adaptations to new implementation contexts, 3) the skills and implementation capacity required to 'train the trainer'. Creative sessions assisted the generation of prototype tools. We have learnt the value of patience and perseverance, as some obstacles need time to be overcome.

8.B. Scientific session: Strengthening health information systems in the European Region

Abstract citation ID: ckae144.468

Organised by: WHO/Europe, EC
Chair persons: Natasha Azzopardi Muscat (WHO/Europe)
Contact: info@mariekeverschuuren.nl

Strong health information systems (HIS) are essential for robust, evidence-informed policymaking and decision making in all levels of healthcare. The COVID-19 pandemic underscored the vital importance of HIS, but also highlighted flaws and weaknesses across HIS in Europe. Common HIS challenges include limited resources and capacity; insufficient coordination and collaboration between HIS stakeholders, leading to fragmentation and problems with interoperability; lack of central governance; and limited use of health information for decision-making. Both at the level of the WHO Regional Office for Europe (WHO/Europe) and the European Commission, policies and strategies are being implemented to support Member States in strengthening their HIS, thereby improving the availability of high quality, timely data for evidence-informed decision making, both at the country and international level. Supporting the further digitalization of HIS is an important element in this. In 2023, WHO/Europe and the European Commission joined forces in the field of HIS strengthening. This workshop will inform participants about current and future capacity building tools and activities that will be implemented under the umbrella of the EU-funded action 'Supporting Member States in the WHO European Region in strengthening HIS and boosting health data governance and interoperability'. It will explain the policy as well as situation-on-the-ground contexts in which the action will be implemented. The workshop will start with a (1) presentation by WHO/Europe on the current HIS situation in the Region and what are the main priority areas in WHO's work for the coming years. After that, (2) the European Commission will give more information on the above-mentioned EU-funded action and the related EU policy landscape, most notably the European Health Data Space (EHDS). Next, (3) WHO/Europe will present their catalogue of capacity building tools and activities, and share experiences with implementing these. Finally, (4) HIS modernization cases with enabling factors and challenges will be presented based on different countries' real life experiences, illustrating the impact of HIS strengthening activities at the country level. Workshop participants will get a comprehensive overview of available HIS strengthening tools and activities in the European Region. This will help them in selecting and applying tools for strengthening their own national or regional HIS, and ensuring their HIS is prepared for aligning with the EHDS and other important policies and strategies. This will contribute to sustainable and future-proof HIS across Europe. During the workshop, there will be ample time for questions and discussion. In the discussion, participants will be asked whether they have any HIS strengthening needs that are not yet covered in the current package of tools and activities. This will help WHO and the European Commission to further harmonise their efforts with what is needed on the ground.

Key messages:

- Despite investments in HIS following the COVID-19 pandemic, many challenges remain, which are often similar across European countries.
- WHO/Europe and the European Commission have joined forces to strengthen HIS and boost health data governance and interoperability, while leveraging EHDS developments.

The status of health information systems and digital transformation in the European Region

Marieke Verschuuren

M Verschuuren[1], *D Novillo Ortiz*[1]
[1]DDH/CPS, WHO/Europe, Copenhagen, Denmark
Contact: info@mariekeverschuuren.nl

Although there have been investments in health information systems (HIS) and digitalization, WHO/Europe's work with Member States (MS) shows that much can be improved still. Typically, there is a strong focus on data collection, but less on analysis and knowledge translation, resulting in available data not being optimally used to support decision making. Standards for data exchange and interoperability have not yet been fully implemented. Efforts are underway to train healthcare professionals, yet only half of MS have developed policies for digital health literacy. Fewer still have implemented a comprehensive digital inclusion plan, leaving disadvantaged populations at risk of falling behind. In line with the traditionally strong focus on HIS strengthening in WHO's work, the European Programme of Work 2020-2025 (EPW) emphasises the need for MS to improve and modernise their HIS to ensure that decisions are data driven. One of the EPW flagship initiatives is Empowerment through Digital Health, promoting the leveraging and scaling up of digital transformation for better health. The Regional digital health action plan for the WHO European Region 2023-2030 outlines the strategic actions needed to achieve this, while fully respecting the values of equity, solidarity and human rights. Collaboration with MS and international partners is vital in this work. WHO/Europe has established several MS-driven health information networks in the past, most notably the European Health Information Initiative (the EHII). The EHII in 2023 has made a restart in the form of the European Health Information Network (HIN). The HIN will guide the work under the EU-funded action 'Supporting Member States in the WHO European Region in strengthening health information systems and boosting health data governance', which will be implemented by WHO/Europe. This strong European Commission and WHO/Europe partnership will be a main catalyst for HIS improvement in the Region the coming years.

The EU-funded action to strengthen health information systems

Jerome de Barros

J de Barros[1]
[1]DG SANTE, European Commission, Brussels, Belgium
Contact: jerome.de-barros@ec.europa.eu

The European Commission initiative to build a European Health Union recognizes the need to address in a coordinated fashion the effects of the pandemic in health and social sectors and to strengthen the resilience, accessibility and effectiveness of health systems through co-operation, best practice exchange, training schemes, technical support and improved data and knowledge management. To make the most of the potential of health data, the European Health Data Space (EHDS) is being established as one of the central building blocks of a strong European Health Union. The EHDS sets out rules, common standards, infrastructures and a governance framework for the use of electronic health data for healthcare, research, innovation and policy making. In line with these policy goals, the European Commission is funding the Action 'Supporting Member States in the WHO European Region in strengthening health information systems and boosting health data governance'. This Action will be implemented by WHO Regional Office for Europe and aims to boost the use and reuse of health data, including by promoting, where possible, the principles and solutions developed and implemented for the EHDS. It will also contribute to the objectives of the EU Global Health Strategy to improve global health security and deliver better health for all in a changing world. In addition, the Action is designed to strengthen countries' capacity across critical programmatic areas of health data and digital health such as data quality (including appropriate data management and analytics) and digital health literacy across the 53 Member States in the WHO European region. The main objectives of the Action are to establish a Health Information Network for strategic guidance; and develop and implement tools and capacities to strengthen health information systems, health data governance, data quality and interoperability in countries.

Contact: adibk@who.int

WHO/Europe offers different tools and capacity building activities to support Member States (MS) in strengthening their health information systems (HIS). These range from assessment methodologies and guidance documents to situation reports and workshops and trainings. The HIS assessment method of WHO/Europe provides an overview of the performance of the entire HIS in an MS. As such, this is often applied as a starting point for HIS strengthening activities in a country, and ideally repeated every few years to measure progress. Next to an assessment of the overall HIS, WHO/Europe also has methods for assessing specific HIS aspects, such as cybersecurity preparedness and GIS capacity. There are also several tools and capacity building activities that specifically focus on strengthening HIS digitalisation (d-HIS). For example, there is a modular d-HIS training, the programme of which can be adapted to meet specific MS needs. This also applies to the population health monitoring training that is available for interested MS. In addition, WHO/Europe has published a range of guidance documents, ranging from a comprehensive d-HIS strengthening manual to guidance on how to write an impactful health report, and guidance on how to apply data protection principles in public health. Finally, WHO/Europe supports HIS strengthening by making Regional and country-level situation reports, and by writing and contributing to scientific papers. In this presentation, first a general overview of available types of HIS strengthening tools and activities will be provided, after which the available tools and capacity building related to data protection and cybersecurity will be presented in more detail, because of the high interest WHO/Europe encounters for these topics in the Region currently.

Abstract citation ID: ckae144.472
Experiences from the European Region: case studies and scenarios to inform ways forward in digital health

Karapet Davtyan

K Davtyan[1]
[1]DDH/CPS, WHO/Europe, Copenhagen, Denmark
Contact: kdavtyan@who.int

Member States in the WHO European Region face similar challenges when it comes to strengthening their HIS and implementing digital health solutions. From WHO/Europe's work with its Member States, several important preconditions have become apparent for successful and sustainable digital transformation. Firstly, the importance of recognising that implementing digital tools is not a one-off investment, but that this takes a long-term vision including long-term budgeting. Having business continuity plans also is a key element of sustainable implementation of digital tools, that is often not adequately addressed in practice. Secondly, the importance of comprehensive strategic planning. Implementing digital tools is not only about software and hardware, but also about people and processes. Here it is also crucial for policymakers to understand that, to be able to harvest the benefits of data that are gathered by means of digital tools, resources for data processing and analysis also need to be made available. Last but not least, an important precondition for successful digital transformation is stakeholder involvement. Often, new software is developed without adequately involving the end-user, resulting in for example apps that do not meet patients' needs. Or in electronic health record systems that are not user-friendly for the healthcare staff that need to enter the data, with incomplete and low quality information as a consequence. Stakeholder involvement is essential in strategic planning for digital health as well. Think for example about standardization and accreditation agencies, and institutes that will be secondary users of data for statistics and research. In this presentation, several case studies from across the European Region will be presented, illustrating how digital transformation in health can be successfully and sustainably implemented.

8.C. Scientific session: Health system resilience: A Planetary Health perspective

Abstract citation ID: ckae144.473

Organised by: EUPHA-ENV

Chair persons: Andrea Schmidt (Austria), Angelique Mavrodaris (UK)

Contact: andrea.schmidt@goeg.at

Planetary Health is a collective and unifying approach to balance the interlinkages between human health, political, economic and social systems as well as the natural systems of our planet, the importance of which is growing in the context of climate change in European countries and beyond. Yet, there is a dearth of of research linking Planetary Health to health systems' resilience, particularly from a public health lens. With the number of studies growing regarding impacts of climate change on health, the question remains how health systems need to be prepared, focusing for example on the emergence of infectious diseases as well as the triple crises of biodiversity loss, pollution and climate change. In addition, tools to assess climate-related risks developed at international level, such as the vulnerability, adaptation and capacity assessment developed by the World Health Organization (WHO) have rarely been piloted in European countries. In this workshop, firstly evidence is presented on the status quo of how climate change impacts health and emerging infections in Europe and at global level. Secondly, the workshop provides insights into how tools to assess vulnerability and resilience of health systems in the context of climate change may be used in the European context. Thirdly, resilience is assessed against evidence emerging from the triple environmental crises of biodiversity loss, pollution and climate change.

Key messages:

- In a planetary health lens, using mixed methods to consider climate change vulnerability of different population groups and adaptation potentials are key to address current complex health challenges.
- Synergistic solutions and joint working across climate and health offer opportunities for greater health system resilience and population health impact.

Abstract citation ID: ckae144.474
Impacts of long-term climate change on human health: a global scoping review

Jesse Limaheluw

J Limaheluw[1,2], *L Hall*[1], *J de Kraker*[1], *F Serafim*[1], *A Roda Husman*[1,2]

[2]Utrecht University, Utrecht, Netherlands
Contact: jesse.limaheluw@rivm.nl

Introduction: Research output on climate change and human health is growing rapidly. This can make it difficult to find and use relevant information to develop public health action.

Methods: We present a global scoping review of the rapidly growing quantitative research output on long-term climate change and human health. We searched Scopus, Embase, and PubMed for quantitative, English language literature published between January 2000 and June 2021 that referenced climate change and human health in titles, abstracts, or keywords.

Results: From 36,956 publications we identified 754 relevant studies. Europe, the Americas, and the Western Pacific were studied much more often than other WHO regions. Research on temperature and vectors accounted for 70% of all included publications. Malaria, diarrheal diseases, and cardiovascular diseases were the most studied specific health outcomes. We found very few studies on non-communicable diseases in low- and middle-income countries. Retrospective publications (153) showed effects of climate change are already occurring worldwide. Most studies on tick-borne encephalitis, malaria, and lower respiratory infections associated with air pollution found impacts caused by climate change have increased. The strongest attribution of climate change was found for heat-related impacts. In prospective publications (626) diarrheal diseases, and impacts associated with heat and chemical air pollution were most consistently projected to increase. Future vector-borne disease impacts were projected to be highly location specific. Some studies demonstrated adaptation can effectively reduce impacts, while noting that capacity to adapt differs greatly between population groups.

Conclusions: Our findings underline climate change impacts are diverse and complex. Future research should prioritize the relatively understudied regions most vulnerable to climate change, such as Africa, and impacts beyond those related to temperature and vector-borne diseases.

Abstract citation ID: ckae144.475
Climate change and emerging infections: Risks, adaptation and response

Angelique Mavrodaris

A Mavrodaris[1,2]
[1]UKHSA, London, UK
[2]Cambridge University, Cambridge, UK
Contact: angelique.mavrodaris@ukhsa.gov.uk

Background: Weather and changing climate are key drivers of the emergence, re-emergence and spread of infectious diseases globally.

However, approaches to emerging infections and climate strategies are still largely being developed separately missing the opportunities for integrated climate adaptation actions to address infectious diseases.

Description: To inform the development of the UK national emerging infectious diseases plan, a literature review of the current and projected risks from extreme weather events and climate change on emerging infections in the UK is currently underway. This will support further work examining and co-designing adaptation options in the context of preparedness and response to emerging infections.

Results: Key preliminary findings from the literature review have indicated risks predominantly from evolving patterns of vector borne diseases as climatic conditions and habitat suitability of pathogens change. Changing temperatures and hotter summer temperatures have been associated with changing food-borne infection patterns. Further risks driven by extreme weather, including flooding and droughts, could perpetuate changes in water-borne infection patterns. Adaptation actions focussed on these infectious disease groups are currently under review and will cover risk assessment, data and surveillance, preparedness and response.

Lessons: This work integrates climate action with action on emerging infectious diseases. By examining the evidence on climate sensitive infections and co-designing solutions across teams, awareness is being raised and relationships and infrastructures built to better prepare and respond to both fundamental global public health challenges.

Abstract citation ID: ckae144.476

Climate change and health vulnerability assessments to increase regional climate resilience

Felix Durstmueller

F Durstmueller[1], *I Horváth*[1], *K Brugger*[1], *AE Schmidt*[1]
[1]Competence Centre Climate and Health, National Public Health Institute, Vienna, Austria
Contact: felix.durstmueller@goeg.at

Background: The impacts of climate change on health and healthcare systems exhibit complex interrelationships, varying across time and space. Population groups already disadvantaged due to their demographics, health, socioeconomic status, or geographical location tend to be particularly vulnerable to climate-related health risks. Our work aims to develop a method for a systematic quantitative vulnerability assessment to make regional vulnerabilities comparatively measurable.

Methods: Building on the WHO framework on Climate Change and Health Vulnerability and Adaptation Assessment (2021) a data mapping process was carried out to identify and validate vulnerability factors and quantitative indicators on a small-scale spatial resolution for the five dimensions: demographic, socioeconomic, biological/health, sociopolitical, and geographic/climate. Regional vulnerability scores for each indicator were calculated and visualized as geographic maps and circular barplots to allow for easily understandable interpretation.

Results: A set of 25 quantitative vulnerability indicators from a multitude of data sources - combining register data, survey data, and geospatial data - was compiled. Main challenges were the identification of sociopolitical vulnerability factors suitable for Austria and data availability on a small-scale level. The indicator set was used to identify regions that are particularly vulnerable due to their population composition, disease burden, and geographical location (e.g. regions in Eastern Austria with high shares of persons < 65 years of age, unemployment, and heat days).

Conclusions: Systematically assessing vulnerabilities in key dimensions is central to identifying regionally specific pressure points, allowing for a quantitative baseline to derive adequate and tailored climate change adaptation measures to sustain future health. Systematic assessment provides essential insights for policymakers, public health officials, and disaster management agencies.

Abstract citation ID: ckae144.477

Climate change adaptation measures in the context of health promotion using participatory foresight

Sophia Spagl

S Spagl[1], *I Horváth*[1], *F Durstmüller*[1], *K Brugger*[1], *AE Schmidt*[1]
[1]Competence Centre Climate and Health, National Public Health Institute, Vienna, Austria
Contact: sophia.spagl@goeg.at

Issue/problem: Climate change is regarded as a big threat to human health (WHO 2023), requiring action to prepare our health systems. Using participatory foresight approach has the potential to increase capacities of communities and to sustain future health. The process is easily transferable to other regions or countries across Europe. The work is part of the Austrian “Climate-Resilience-Check Health for regions and municipalities”.

Description of the problem: We present an innovative qualitative method to contribute to a climate change and health vulnerability and adaptation assessment following WHO’s guidelines. Questions answered by the project were: • What measures can be taken to shape the regions’ potential for a health-promoting lifestyle and to increase climate resilience? • Does participatory foresight represent a well-suited method to develop climate adaptation measures which address local needs? Taking place between 10/23 to 12/23, the participatory foresight process consisted of (1) a foresight-workshop facilitating development of adaptation measures through the creation of personas and (2) intervention boards, which gave the broader population the opportunity to vote for measures developed in the workshop. The aim of the approach was to identify measures that receive approval within the population.

Results: The participatory foresight process highlighted the local populations’ wish of revitalizing village centers to strengthen social cohesion. Particular emphasis was placed on the establishment of a community center and the expansion of daycare services.

Lessons: The process will be conducted in further regions as part of the Climate-Resilience-Check Health for Austrian regions and provides lessons of good practice for roll-out across European countries aiming to bridge efforts for climate adaptation and health promotion at regional levels.

Abstract citation ID: ckae144.478

How are the three environmental threats challenging health systems’ resilience?

Susana Viegas

S Viegas[1]
[1]Department Occupational and Environmental Health, NOVA National School of Public Health, Lisbon, Portugal
Contact: susana.viegas@ensp.unl.pt

Background: Known avoidable environmental risks cause about one quarter of all deaths and disease burden worldwide, amounting to at least a steady 13 million deaths each year. Indeed, diseases caused by the environment weigh heavily on health systems. These not only harm directly human health increasing the burden of disease but also potentiate other threats, by acting as drivers (e.g. pandemics, antimicrobial resistance). In addition, the increased burden due to these environmental threats also put in risk the capacity of health systems to adapt to the new healthcare needs and to provide a proper answer to the diseases caused by other health determinants.

Methods: Based on a review of the literature, the presentation addresses the question of potential options in public health climate action at the interface of environmental sustainability and health systems sustainability and resilience. It identifies possible priority areas in order to guarantee environmental and healthcare sustainability.

Results: Approaches that focus on treatment of individual diseases rather than improvement of environmental determinants of health will be insufficient to tackle the triple environmental crises of climate change, biodiversity loss and pollution. Single-determinant approaches are unlikely to achieve expected improvements, given the complex interaction of environmental factors.

Conclusions: Approaches that are more integrated are required to address the root causes of disease and guarantee health systems sustainability, which are often defined by policies in key sectors other than health, such as the environment. Multi-sectoral actions are needed to prevent and mitigate the threats to human health from the ongoing and interconnected environmental crises of climate change, biodiversity loss and pollution, contributing to a Planetary Health perspective on health systems' resilience.

8.D. Scientific session: Equitable Immunization: Leveraging Prisons for Vaccination Equity in Europe

Abstract citation ID: ckae144.479

Organised by: University of Pisa (Italy), EUPHA-IDC
Chair persons: Filipa Alves da Costa (WHO/Europe), Heino Stöver (Germany)
Contact: lara.tavoschi@unipi.it

Addressing low vaccine coverage is a pressing public health concern in Europe, where pockets of unvaccinated individuals persist despite ongoing efforts. The European region sees an estimated 1.4 million individuals detained on any given day, with a significantly higher number passing through prisons annually due to high turnover rates. Those experiencing incarceration often come from socially marginalized and disadvantaged groups, facing a multitude of health challenges including non-communicable diseases, infectious diseases, mental illness, cognitive disabilities, and substance dependence. Despite their elevated health needs, individuals in prison frequently encounter barriers to accessing healthcare services, including preventive measures such as vaccination. Available but limited data suggest that individuals entering the prison system are often under-immunized, particularly against Hepatitis B Virus (HBV), influenza, measles, mumps, rubella (MMR), and pneumococci. Unfortunately, vaccination services within prisons are often insufficient, typically being provided according to national schedules or in response to outbreaks of vaccine-preventable diseases (VPDs). It's crucial to distinguish between the availability of vaccination services and actual coverage, as the modalities of vaccination offerings vary across the region. While individuals in prison are recognized as a target group for HBV vaccination, the methods of offering vaccines may differ based on factors such as age or risk group. Nevertheless, systematic implementation of HBV vaccination in prisons has shown clear benefits for both incarcerated individuals and the wider community. Given the significance of vaccinations in preventing diseases like HBV and human papillomavirus (HPV), which are linked to cancer, initiatives like the Europe Beating Cancer Plan and the European Council Recommendation on vaccine-preventable cancer emphasize their importance. Prisons can serve as a strategic point for delivering comprehensive healthcare and vaccination services to incarcerated individuals, yet routine data on vaccination coverage at entry and uptake during incarceration are often lacking, hindering effective health planning. To address this public health challenge, the 'Reaching the hard-to-reach: Increasing access and vaccine uptake among prison population in Europe' (RISE-Vac) project consortium has been formed. This collaborative effort brings together diverse expertise and established networks in the field of prison health, reflecting the varied epidemiological and structural landscapes across Europe. The objective of this workshop is to showcase recent research findings, evidence-based practices, and policy recommendations aimed at enhancing vaccination equity in the European region. By sharing insights and best practices, we aim to bolster efforts to improve vaccine access and uptake among incarcerated populations, ultimately contributing to broader public health goals.

Key messages:

- Prison health is public health: vaccination services in prison are essential to achieve immunization targets in Europe.
- Maximizing inter-sectoral collaboration is crucial for bridging the gap in vaccination access and uptake among people living in prison in Europe.

Contact: e.plugge@soton.ac.uk

Enhancing vaccination literacy is pivotal in addressing hesitancy, especially among incarcerated populations who may lack regular access to health information, thus ensuring health equity. Supported by the European Union, the RISE-Vac project endeavours to bolster vaccine literacy, accessibility, and uptake within European prisons. To discern vaccination knowledge gaps and preferences for information dissemination, consultations were conducted with incarcerated individuals in the United Kingdom (via the Prisoner Policy Network), France, and Moldova. A total of 344 responses were garnered: 224 from the UK, 70 from France, and 50 from Moldova. In addition a focus group was conducted in the UK. The key themes that emerged were common across the 3 participating countries: views of vaccination, prior knowledge about vaccines, areas of appetite for learning, availability of reliable information, and preferred mechanism for information sharing. Participants were particularly interested in learning about the effectiveness, side effects, and manufacturing of vaccines. Their invaluable input informed the creation of educational materials, notably a brochure slated for pilot testing in European prisons and a video clip. Notably, individuals with lived prison experience were actively engaged at every phase of this initiative, ensuring its relevance and efficacy.

Assessing vaccine hesitancy and vaccine literacy in the European prison population: a multicenter repeated cross-sectional study

Laura Baglietto

L Baglietto[1], *E De Vita*[1], *J Mavrou*[2], *I Yiasemi*[2], *A Bardelli*[1]
[1]University of Pisa, Pisa, Italy
[2]Cyprus National Addictions Authority, Nicosia, Cyprus
Contact: laura.baglietto@unipi.it

The study aimed to quantify vaccine hesitancy and vaccine literacy in prison populations and assess their correlation prior and after the implementation of training and information activities targeting PLP. A repeated cross-sectional observational study was conducted in 13 prisons of 4 European countries prior and after the implementation of a co-developed training package. The study sample included 847 people living in prison in the baseline round. The second round is currently ongoing. Through a structured questionnaire vaccine hesitancy, vaccine literacy, general health literacy, previous vaccine refusal history and socio-demographic characteristics of participants were assessed. Exploratory factor analysis was used to extract three independent components of vaccine hesitancy. Logistic regression was applied to assess the association between previous vaccine refusal and vaccine hesitancy; multiple linear regression was applied to assess the association between vaccine hesitancy and vaccine literacy and general health literacy. All analyses were adjusted for socio-demographic variables. In the baseline round, we identified three independent components of vaccine hesitancy explaining 49% of the total variance: Mistrust (proportion of the variance explained, 27%), Concern (14%) and Conspiracy (8%). All the components were associated with previous vaccine refusal (p-value <0.001) and presented very good internal consistency. Young participants presented the highest levels of vaccine hesitancy; migrants had the lower levels of Mistrust and the higher level of Concern; all three factors were lower among participants with the highest degree of academic education. Mistrust and Concern were inversely associated with vaccine literacy while all three subscales were associated with general health literacy (all p-values <0.001).

Introducing vaccination services in prison settings: case study from Moldova

Irina Barbiros

I Barbiros[1], *V Busmachiu*[1], *S Doltu*[2], *L Jignea Suveica*[1]

Introducing vaccination services within prison settings presents a multifaceted challenge and opportunity, particularly evident in the case of Moldova. This Eastern European nation grapples with various socio-economic and healthcare disparities, with its prison population often experiencing heightened health vulnerabilities. Amidst such complexities, the implementation of vaccination services emerges as a crucial strategy not only to safeguard the health of incarcerated individuals but also to contribute to broader public health goals. Moldova's journey in this regard reflects a commitment to advancing preventive healthcare within its correctional facilities. The introduction of vaccination services in prisons necessitated a comprehensive approach, encompassing policy development, infrastructure enhancement, staff training, and community engagement. Infrastructure enhancement was imperative to ensure the provision of vaccination services in a safe, efficient, and dignified manner within prison settings. This involved the establishment of designated vaccination areas equipped with the necessary medical supplies and equipment. Staff training emerged as a cornerstone of the initiative, empowering healthcare professionals working within prisons with the knowledge, skills, and confidence to deliver vaccination services effectively. Training programs encompassed various aspects, including vaccine administration, adverse event management, and communication strategies tailored to the specific needs of incarcerated individuals. Collaboration with people living in prison facilitated the dissemination of accurate information, addressed concerns, and encouraged participation in vaccination programs. During the period 2021-2023 7454 doses of antiCOVID-19, 1298 doses of anti-Flu vaccine, 3083 doses of anti-HBV vaccines were administered.

In Montpellier prison in France and San Vittore remand house in Italy, the provision of expanded, age-appropriate, coercion-free, and tailored vaccination services to PLP has emerged as a cornerstone in improving health outcomes within prison settings. The implementation of life course vaccination programs required the full integration of prison health into public health systems building on existing vaccination services covering HBV, flu and COVID-19. In San Vittore, a vaccination clinic aimed at people living in prison was set-up. Universal vaccination status assessment and vaccination catch-up was introduced targeting people admitted into prison. The vaccination clinic-related activities included information and awareness sessions on vaccination and health literacy offered regularly to PLP: increased vaccination knowledge is effective to enhance uptake. The vaccination clinic team consisted of infectious diseases physicians and a health assistant with an anthropological background, who ran the information and awareness sessions combining and adapting core content on vaccination with individual and community social and cultural contexts. Besides seasonal flu vaccination and anti-SARS-CoV-2 immunisation campaigns, vaccinations against pneumococcal pneumonia and herpes zoster were also offered to older and fragile individuals as per national immunization plan. One of the priority objectives of the vaccination clinic was the increase in vaccination coverage against HBV and HPV, not only as a tool for the prevention of infectious diseases, but as an innovative and effective tool of cancer prevention. As part of a more ambitious program to protect sexual health in prison and related to updated screening tools for the early diagnosis of lesions due to HPV infection, vaccination against HPV was also offered as part of a health empowerment project tailored to women in detention, with the aim of building self-awareness of their own health needs.

[2]Institute of Addiction Research, Frankfurt University of Applied Sciences, Frankfurt, Germany
[3]Heidelberg Institute of Global Health, Heidelberg University, Heidelberg, Germany
Contact: lara.tavoschi@unipi.it

The RISE-Vac project consortium applied evidence-based public health methods to collate, assess, and analyze all the evidence generated through project activities, including literature review and prospective data collection on quantitative and qualitative aspects of vaccine services implementation in prison settings. A multi-sectorial and inter-disciplinary group of experts was set-up including health professionals, statisticians, social scientists and people with lived experience from civil society organisations, health services, prison administrations, academia and international agencies. A set of recommendations, advice, and policy options on how to increase vaccine uptake, targeted to people in prison and using a citizen-centred approach, were developed and tailored to specific needs profiles of different prison population subgroups. Vaccinations to be considered in prison settings were grouped according to target population and/or public health objective into: Seasonal vaccinations and vaccination during outbreak; Childhood life-course vaccinations (booster doses); Vaccinations for cancer prevention; Vaccination for older population groups and people with chronic conditions. In consideration of the diversity of the countries participating in the project, their epidemiological context and available resources and infrastructures, a multi-tiered approach for the development and implementation of models for vaccination services implementation in prison settings was devised, encompassing core vaccinations, such as HBV, Flu, COVID-19 and tetanus, as well as expanded vaccination offer to respond to enhanced health needs and to promote equity of health outcomes, including e.g. HPV vaccination.

8.E. Skills building seminar: Methods for measuring the true health cost of pollution

Abstract citation ID: ckae144.485

Organised by: BEST-COST, EUPHA-PHMR, -ECO
Chair persons: Brecht Devleesschauwer (Belgium), Hanna Tolonen (EUPHA-PHMR)
Contact: Brecht.Devleesschauwer@sciensano.be

Healthy environments are essential for physical and mental well-being. Air pollution is considered to be one of the most significant environmental risk factors for ill health and premature death within the European Union. Poor air and noise quality have been linked to the exacerbation of symptoms, hospital admissions, and even premature deaths, especially for those with cardiorespiratory diseases. The associated medical costs and productivity losses therefore also impose a large economic cost. Exposure to environmental stressors disproportionately affects socially disadvantaged groups, and therefore contributes to the large socioeconomic inequities in health observed persistently in Europe. The EU has prioritised action on causes of pollution. For example, its Green Deal outlines ambitious plans to address climate challenges such as pollution and align air quality ambitions closer to the World Health Organization guidelines. Likewise, the European Environmental Agency routinely monitors the mortality burden associated with air pollution, while the impact of environmental noise on European citizens is examined through the Environmental Noise Directive. While in the political scene there is interest to advance the reduction of pollution, efforts are hindered by the lack of an harmonized methodology to quantify the socioeconomic cost of environmental stressors. Currently, researchers working with the burden of disease framework face many challenges in its application in the context of environmental stressors. Among others, these challenges include unmet data needs and major lack of transparency in methodological developments. In this skills-building seminar, we will outline an integrated approach for measuring the true health cost of pollution. This approach is currently being trialled in the EU-funded BEST-COST project, which sets out to improve methodologies for understanding the socioeconomic cost of environmental stressors, focusing on air and noise pollution. The project brings together a consortium of 17 partners from Europe and the USA, and is led by Sciensano, the Belgian institute for health. Through a synergy of theoretical outlines and real-life examples, seminar participants will gain methodological insights in the three key components of this integrated approach - i.e., the quantification of the health burden of environmental stressors via comparative risk assessment, the monetization of Disability-Adjusted Life Years to assess economic impact, and the quantification of environmental health inequalities via a novel area-level based framework.

Key messages:

- There are significant unmet needs with respect to both data and methodologies for quantifying the socioeconomic cost of environmental stressors.
- We outline an integrated approach for measuring the true health cost of pollution, combining health burden, economic burden, and environmental health inequalities.

Abstract citation ID: ckae144.486
Quantifying the health burden of environmental stressors

Juanita Haagsma

JA Haagsma[1]

Contact: j.haagsma@erasmusmc.nl

The Burden of Disease (BoD) concept has gained increasing importance for health risk assessments, driven by the World Health Organization (WHO) and the Global Burden of Disease (GBD) studies. BoD utilizes the disability-adjusted life year (DALY) to express the population health impact of a disease, injury or risk factor. This information is essential for priority-setting in health, monitoring and evaluation of preventive interventions. However, calculating DALYs, particularly DALYs attributable to risk factors, requires a range of choices with regards to input data and methodological aspects. In this presentation we will focus on comparative risk assessment (CRA), a frequently used method to calculate the attribution of DALYs to risk factors. CRA consists of determining outcomes that are associated with a certain risk factor and relative risks of the identified outcomes as a function of exposure. This information is usually derived from systematic literature review(s). Next, information on the level of exposure in a population is required, usually by age, sex, location and/or year, and usually using a range of data sources on level of exposure. Additionally, the level of exposure associated with a minimum risk is assessed. Population attributable fractions (PAFs) are then multiplied by the relevant outcome quantity for each population subgroup to calculate the number of DALYs attributable to risk factors. Finally, mediation of risk factors through other risk factors can be taken into account. Knowledge of and uniformity in methods used to perform CRAs will facilitate the coherence and usability of estimates of the health impacts of risk factors and strengthen evidence-based decision-making in health policy. In this presentation, we will introduce the CRA approach and outline a number of innovations that are being driven by the BEST-COST project, including new methods for correlated outdoor exposures and for outdoor exposures penetrating to indoor environments.

Environmental stressors are an important source of burden of disease worldwide. The accurate economic evaluation of health hazards caused by environmental stressors guide the design of more effective and comprehensive public policies. However, guidelines on cost assessment, monetisation and discounting methodologies are scarce. Therefore, several different methodologies are applied in multiple contexts, making comparability difficult. Within BEST-COST, methods for monetising health hazards caused by environmental stressors are identified and described based on a systematic review approach. An electronic search was performed in Medline, Scopus, Web of Science and Econlit, alongside with grey literature and citation and reference tracking identifying all relevant studies. Different methods are identified, such as value of a statistical life (VSL) and value of a life year (VOLY), as well as specificities from data collection to modelling for the economic evaluation. These methods may be categorised based on their approach (market-based or non-market based), perspective of analysis (payer, patient or societal) and health measures. In this presentation, the various key methodologies to assess the economic impact of environmental stressors on health will be introduced and demonstrated. Through these insights, workshop participants will be supported in performing health impact assessments and cost-benefit analyses, which play a pivotal role in informing public policies that impact environment and subsequently health.

In the process of designing equitable policies to reduce the burden of environmental stressors, it needs to be taken into consideration that socially disadvantaged communities are disproportionately exposed to environmental pollutants. These environmental health inequalities are currently however not routinely taken into account when designing mitigation measures, amongst others because of the absence of a coherent methodological framework. Within the BEST-COST project, an innovative framework for assessing social inequalities in the socioeconomic impact of environmental stressors will be developed and implemented. In particular, a novel index of multiple deprivation was developed. This includes indicators that are considered to be temporally and culturally valid for assessing social and material deprivation in Europe. In particular the new index was developed to make comparison across different European countries and to be used at a small geographical level. Within the workshop we will discuss the stepwise framework developed, starting from the results of a scoping review conducted to gather information methodological approaches used in the currently existing MDIs developed in Europe. The results of the scoping review were used to make informative decisions about the selection of indicators and other relevant methods (e.g. weighting). The construction of the composite score for the use within BEST-COST was evaluated also considering the data availability of the selected indicators at a small geographical level (i.e. LAU2) for the case-study countries: Belgium, Estonia, France, Norway and Portugal. Initial results of the quantification of social inequalities in the burden of environmental will be presented. Participants to the workshop will be able to understand the advantages and challenges of this kind of exercises with specific examples.

8.F. Scientific session: Promoting Public Health with healthy smart buildings

Abstract citation ID: ckae144.489

Organised by: EUPHA-URB, -PMH, -ENV
Chair persons: Jutta Lindert (EUPHA-PMH), Stefano Capolongo (EUPHA-URB)
Contact: andrea.rebecchi@polimi.it

The Workshop titled “Promoting Public Health with healthy smart buildings” - proposed and developed by the three EUPHA Section: Urban Public Health (URB), Public Mental Health (MEN) and Environmental Health (ENV) - is aimed to foster the dialogue between designers (architects and urban planners), Public Health experts (operators, professionals and epidemiologists), policy/decision makers and buildings’ users, to establish a multidisciplinary approach for understanding together how to create and manage healthy living indoor environments (both housing and complex constructions/public buildings). According to the main Conference topic “Sailing the waves of European public health: exploring a sea of innovation”, the workshop mainly addresses both the “Climate emergency/Environment and health/Urban health” and the “Mental health” EPH24 conference topics. The workshop purpose is to explore the effects of the housing conditions, according to “umbrella” exposure of the quality of the buildings, stressing topics like emissions, qualities, functional features, accessibility, supportive, Indoor Environmental Quality, Indoor Air Quality, and health implications on users’ well-being. In fact, time spent at home and in the indoor environment increased due to the COVID-19 experience, and social-sanitary emergencies are expected to grow due to the urbanization phenomenon. Thus, the role of the physical environment in which we live, study, and work, has become of crucial importance, as the literature has recently highlighted. The workshop program includes inputs which they argue current experiences, emerging practices and scientific outcomes related to the healthy Buildings, coming from four different European countries. From Sustainable Development Goals, in “Healthy air for healthy minds”, to Indoor Environmental Quality implications, in “How to promote health in indoor living and working spaces: quali-quantitative analysis to evaluate the indoor air quality through users’ perception and low-cost sensors”. From experience-based works related to specific functions, in “Leveraging digital platforms to improve Public Health in hospital smart buildings”, to other specific public buildings’ experiences, in “Novi Sad cultural stations as healthy buildings for wellbeing concept”.

Key messages:

- explore the relationship between housing conditions, Indoor Environmental Quality, and the implications on users’ well-being, like “umbrella” exposure of the quality of the buildings.
- establish a multidisciplinary approach for understanding together how to create and manage healthy living indoor environments, at private and public scale.

Abstract citation ID: ckae144.490
Healthy air for healthy minds

Jutta Lindert

J Lindert[1], *J Chihai*[2]

[2]Department of Mental Health, Medical Psychology and Psychoterapy, State Medical and Pharmaceutical University, Chisenau, Moldova
Contact: jutta.lindert@hs-emden-leer.de

Background: The adverse health effects from exposure to air pollution is increasingly known. A recent report shows that at least 95% of the world’s population breathe air containing dangerous levels of pollutants. According to estimates from the World Health Organization (WHO), ambient air pollution is related to 4.2 million deaths every year. Less is known about the association between indoor air (especially particulate matter 2.5 and volatile organic compounds (VOC) pollution and mental health conditions. Many sources of indoor air pollution exist, such as pressed wood products, pesticides, secondhand smoke, stoves, heaters, overcrowding and fireplaces.

Aims: We aim to synthesize knowledge on the effects of particulate matter 2.5 in indoor air and mental health conditions.

Methods: We systematically reviewed the association of indoor air pollution with mental health conditions using the databases Pubmed and EMBASE.

Results: Exposure to indoor air pollutants is associated with increased anxiety and depression and less cognitive performance. These results are robust; however, the impact of PM2.5 is larger for less-educated and female respondents. Females cook with solid fuels and biomass more often. Physical exposure and gender factors overlap in the exposure to indoor air pollutants.

Discussion: Poor indoor air quality should be part of a comprehensive assessment of factors influencing mental health and cognition. Neuroinflammation might explain the effects of poor air on mental health and cognition. Further research is needed to combine research on the social determinants of mental health and the effects of indoor air. Studies in different settings such as home, work, and hospitals are needed to better understand the specific exposures of indoor air pollution and mental health conditions in different population groups.

Contact: marco.gola@polimi.it

It is well-known that humans spend most of their time in indoor spaces: what it is sometimes underestimated; however, is how much the space in which someone is can affect their abilities, feelings and even their mental and physical health. A team developed a methodology to allow the collection of useful data and giving rise to management strategies for guaranteeing healthy spaces, in terms of Indoor Environmental Quality (IEQ). In particular, the methodology is based on a quali-quantitative analysis of Indoor Air Quality (IAQ) supported by a questionnaire on users’ perception and well-being, based on a scoping review, and low-cost sensors for IAQ monitoring air contaminants (carbon dioxide, temperature, relative humidity, volatile organic compounds, etc.). In particular, for the quantitative analysis, the team adopted a method that considers the location of the sensors in different typology of settings with various solar exposures, ventilation systems, human occupancy, type of activity, etc. with the scope of testing the trends in different seasons. As well as the qualitative data collect several information about the users’ perceived comfort and the symptoms (headache, fatigue, etc.) during their stay. The data analysis highlights how the different users’ perceptions affect the conditions of the environmental units, in particular in crowded rooms (4-6 people). Adequate lifestyles, such as door and window-openings, regular air-changes, etc. can highly affect the performances and the productivity, as well as the quality of the spaces. In that sense the use of low-cost sensors with light signals can be helpful as strategy for informing the user of the state of the air and any actions to be implemented. In conclusion, starting from the methodology, the team gives rise to a decalogue of strategies and good habits that permits -through the support of low-cost sensors - to inform the users on how to guarantee healthy living and working spaces.

The integration of digital platforms into hospital infrastructure represents a significant leap forward in public health management. This session explores how smart hospital buildings, equipped with advanced digital technologies, can enhance public health outcomes through more effective disease surveillance, improved environmental controls and enhanced patient care management. Smart hospital

buildings utilize a range of new technologies such as IoT sensors, AI-driven analytics and big data solutions to monitor and optimize various aspects of hospital operations and care. These technologies enable real-time data collection on environmental conditions, patient health metrics and resource utilization, creating an ecosystem that not only supports the immediate health needs of patients but also contributes to broader public health goals. The session will address four key areas where digital platforms can make an impact:
-Disease Surveillance and Management: Digital tools can track health data trends and patterns within hospital settings, enabling early detection of infectious outbreaks and more precise tracking of patient outcomes.
-Environmental Monitoring: IoT sensors can continuously assess conditions such as air quality, temperature and humidity, which are critical for preventing hospital-acquired infections and ensuring a safe environment for patients and staff.
-Resource Optimization: AI algorithms can analyse data to optimize resource allocation, ensuring that medical supplies and human resources are used efficiently, which is crucial in health emergencies.
-Patient-Centred Care: Digital platforms can facilitate personalized patient care through real-time health monitoring and data analysis, ensuring timely medical interventions and better health management.
This session will highlight case studies demonstrating successful implementation of digital technologies in smart hospital buildings and discuss the challenges and lessons learned from these initiatives.

Abstract citation ID: ckae144.493

Novi Sad cultural stations as healthy buildings for wellbeing concept

Marija Jevtic

M Jevtic[1], *D Polić*[2]
[1]Institute of Public Health of Vojvodina, Faculty of Medicine University of Novi Sad, Novi Sad, Serbia
[2]Urban Planning, Research and Development Centre, Institute of Architecture and Urban Planning, Novi Sad, Serbia
Contact: marija.jevtic@uns.ac.rs

Creating spaces for all citizens through the cultural stations project within the Novi Sad - European Capital of Culture 2022 has set an example of applying the concept of well-being which involves integrating various elements that support physical, mental, and social health. Cultural stations project in the city of Novi Sad is a concept supporting cultural programming, healthy food options, mental health support, accessibility and inclusivity, as well as community engagement. Social interaction in urban areas is vital for mental and emotional well-being, fostering a sense of belonging and community, diverse cultural programming that appeals to different groups, cultural activities such as art exhibitions, performances, workshops, and community events provide opportunities for creativity, learning, and social engagement, enhancing overall well-being. Access to cultural stations, spending time there has been linked to reduced stress, improved mood, and increased feelings of well-being within 7 neighborhoods of Novi Sad. This includes providing barrier-free access, accommodations for individuals with disabilities, and programming that is inclusive and welcoming to everyone. Participation of the local community in the design, programming, and management of cultural stations is also important. By integrating these principles into the design, programming, and management of cultural stations, Novi Sad creates vibrant, inclusive, and healthy spaces that contribute to the overall well-being of its residents and visitors. Cultural stations are located in different parts of the city in order to provide accessibility to all citizens. Their arrangement is in accordance with the recommendations of green construction and restoration, and the interior and surroundings foster respect for nature and nature-based solutions. Also, they are developing different content in line with culture, but also science, health and smart solutions as a tool for well-being.

8.G. Scientific session: The German National Cohort (NAKO): Current state, follow up data collection and selected results

Abstract citation ID: ckae144.494

Organised by: NAKO e.V.
Chair persons: Barbara Bohn (Germany), Jennifer Hilger-Kolb (Germany)
Contact: Jennifer.Hilger-Kolb@nako.de

This workshop aims to give an overview on current state and selected results of the German National Cohort (NAKO). NAKO is the largest, multidisciplinary population-based cohort study in Germany. The overall aims of NAKO are: 1) to elucidate pathways to major chronic diseases such as diabetes, cancer, cardiovascular, pulmonary, neuro-psychiatric, and infectious diseases, focusing on determinants and exposures (e.g., socioeconomic, psychosocial, behavioural, occupational, and environmental factors); 2) to assess regional differences; and to improve prevention and early detection of disease. Between 2014 and 2019 more than 205,000 men and women aged 20-74 years at baseline were recruited in 18 study centres across Germany. During their examination participants underwent an extensive programme including a face-to-face interview, self-administered, computer-based questionnaires, in-depth biomedical examinations, and the collection of various bio-samples. In addition, at 5 study centres a subgroup of almost 31,000, received whole-body magnet resonance imaging (MRI). In 4-5 year intervals, all study participants are re-invited for examination at the study centres. The first re-examination started in October 2018 and will be finished in July 2024. In parallel the pilot phase for the second re-examination will start in May 2024. The programme for both re-examinations is similar to the baseline programme. Thereby, longitudinal information on changes in risk factor profiles and in vascular, cardiac, metabolic, neurocognitive, pulmonary and sensory function is collected. During the COVID-19 pandemic two supplemental questionnaires focusing on pandemic-related aspects were provided to all NAKO participants at two different time points. The first COVID-19 questionnaire collected data on more than 160,000 participants during the first COVID-19-related lockdown in Spring 2020. The questionnaire included questions on general state of health, Sars-CoV-2 symptoms, changes in psychosocial, socioeconomic, and behavioural factors (e.g., physical activity). The workshop session consists of four presentations. The first presentation will provide insights into the extensive examination programme of NAKO, will give a short overview on the current state and plans for follow-up of data collection. In addition, it will briefly inform about possibilities to get access to NAKO data. Furthermore, the workshop will include three presentations on selected results of NAKO to demonstrate its broad research scope. The presentations will focus on the following topics: 1) cardiovascular disease and sex differences according to socioeconomic position, 2) cognitive functioning according to income, employment and living alone, 3) physical activity and changes during the COVID-19 pandemic.

Key messages:

- Due to the large sample size, and the broad research scope, NAKO provides an excellent resource to scientists form different research disciplines and enforces interdisciplinary collaborations.
- The workshop will be informative to researchers who are planning to work with NAKO data as data access within the European Union/the European Economic Area is open since spring 2024.

Abstract citation ID: ckae144.495

The German National Cohort (NAKO) is a multidisciplinary, population-based cohort study that aims to investigate the development and aetiology of diseases, identify risk factors and enhance early detection and prevention of diseases. Between 2014 and 2019, a total of 205,415 subjects aged 20 -74 years were recruited and examined at 18 study centres across Germany. The baseline assessment included a face-to-face interview, self-administered questionnaires, a wide range of biomedical examinations and the collection of various bio samples. Furthermore, whole-body magnetic resonance imaging (MRI) was performed on 30,861 participants at 5 of the18 study centres. The first re-examination of study participants started in October 2018, and will be completed end of July 2024 aiming for at least 135, 000 participants. Until April 2024 134,428 participants completed their second examination, including 18,707 participants with additional MRI examination. The second re-examination will start in May 2024 and will last until April 2028 aiming to examine at least 85,000 participants for a third time. Besides the examinations at the study centres, participants receive written health questionnaires (GEFUs) 2-3 years after their last examination to get additional information on incident diseases and changes in exposures. The first GEFU questionnaire (GEFU-1) was conducted between October 2017 and May 2023 and was filled in by 171,181 participants. Since the start of GEFU-2 in March 2023 65,624 participants have answered the GEFU-2 questionnaire. Due to the longitudinal design, the large sample size and the broad examination programme, NAKO provides information on determinants of population health and disease. Thus, it is a valuable resource for researchers from different disciplines.

Background: Low socioeconomic position (SEP) is associated with cardiovascular disease (CVD) risk; yet, the underlying pathways are not fully clear and may affect sexes differently. We investigated sex differences in the relationship of SEP with prevalent CVD, cardiovascular risk factors (CRF) and estimated cardiovascular risk in a contemporaneous German population.

Methods: Data derived from the baseline examination of 204,780 participants in population-based German National Cohort (NAKO). Logistic, multinomial, and linear regression models were used to estimate sex-specific odds ratios (OR) and beta-coefficients with 95% confidence intervals (CI) of CVD, CRF and very high-risk score (SCORE2 $\geq$7.5% (age 40-49 years) or $\geq$ 10% (age 50-69 years)) associated with educational attainment and relative income. Women-to-men ratios of ORs (RORs) with 95%-CI were estimated.

Results: In women compared to men, low vs. high SEP was more strongly associated with obesity, overweight, self-reported myocardial infarction and hypertension, elevated blood pressure values, antihypertensive medication, and alcohol consumption, but less strongly related to smoking. In women with the lowest vs. highest educational level, the OR for a very high 10-year CVD risk was 3.61 (95%-CI 2.88; 4.53), compared to 1.72 (95%-CI 1.51; 1.96) in men. The women-to-men-ROR was 2.33 (95%-CI 1.78; 3.05), attenuated after age-adjustments. For the comparison of low vs. high relative income, the odds of having a very high 10-year CVD risk was 2.55 (95%-CI 2.04; 3.18) in women, and 2.25 (95%-CI 2.08; 2.42) in men (women-to-men ROR, 1.31 (95%-CI 1.05; 1.63).

Conclusions: In both sexes, there was an inverse graded relationship between SEP and the likelihood of prevalent CVD and CRF, with stronger associations in women than in men. Although women had a lower estimated 10-year CVD risk compared to men, the likelihood of having a very high CVD risk conferred by low SEP vs. a high one was higher in women than in men.

Background: While people with low socioeconomic status tend to have worse cognitive functioning, little is known about the impact of specific socioeconomic conditions. Aim of the present analysis was to investigate to what extent cognitive functioning differs by three socioeconomic conditions: low income, being without employment, and living alone.

Methods: A total of N = 158,144 participants (age 19-75 years) of the population-based German National Cohort (NAKO) provided data on socioeconomic conditions and completed cognitive testing. Multivariable regression model including the three socioeconomic conditions, age, sex, education, occupational status, having diabetes, hypertension, myocardial infarction, stroke, and depressive symptoms was used for analysis.

Results: Results from fully adjusted analysis indicated that cognitive functioning (z-score) was lower among those with low income (b=-0.53, CI95%=-0.57; -0.49) compared to not having low income, living alone (b=-0.10, CI95%=-0.14; -0.07) compared to not living alone, and being without employment (b=-0.22, CI95%=-0.27; -0.17) compared to being employed. The difference in cognitive functioning between those exposed compared to not exposed to the condition was changing slightly with older age among those with low income (interaction with age b=-2.39, CI95%=-3.24; -1.55) and, to a smaller extent, among those living alone (interaction with age b=-0.76, CI95%=-1.34; -0.19).

Conclusions: Low income, being without employment, and living alone were independently associated with poorer cognitive functioning after adjusting for confounders. As those with low income had the poorest cognitive functioning in old age, it is important to explore pathways of how cognitive health in this population group can be improved.

Contact: florian.herbolsheimer@nct-heidelberg.de

Background: During the COVID-19 pandemic's first wave, mobility restrictions and protective measures have impacted both public and private life. In Germany, the population was advised to stay home except for work, outdoor sport activities, and essential shopping. This study aims to evaluate how these measures affected physical activity and sedentary behavior, focusing on identifying the groups most affected.

Methods: In April and May 2020, we distributed a COVID-19-specific questionnaire to participants of the German National Cohort (NAKO). The questionnaire was specifically designed to assess changes in physical activity and sedentary behavior compared to pre-restriction levels, along with data on anxiety and depressive symptoms.

Results: Around 26 % of the 152,421 respondents reported increased sedentary time, and about 38 % reported reduced participation in sport activities compared to pre-restriction levels. Over one-third of those who previously met the WHO's physical activity recommendation could not maintain it during the restrictions. There was also a notable decline in active transportation (M = -0.12; 95% CI: -.126; -.117), whereas participants spent more time on recreational physical activities (M = 0.12; 95% CI: .117; .126). Based on multivariable linear and log-binomial regression models, we found that younger people were more affected by the restrictions than older adults. Factors such as transitioning to remote work, self-rated health, and depressive symptoms strongly correlated with changes in all physical activity domains, including sedentary behavior and adherence to physical activity guidelines.

Conclusions: The shift towards inactivity or low-intensity activities during the nationwide restrictions poses potential long-term health risks, highlighting the urgent need for public health policies to address the negative impact of COVID-19 restrictions on physical activity and sedentary behavior.

8.H. Scientific session: Coordinated actions to improve our response to Long COVID at EU and national levels

Abstract citation ID: ckae144.499

Organised by: DG SANTE European Commission, NIVEL (Netherlands), EUPHA-HSR
Chair persons: Stefan Schreck (Luxembourg), Johan Hansen (EUPHA-HSR)
Contact: j.hansen@nivel.nl

The COVID-19 pandemic still has very real and far-reaching consequences for European citizens, healthcare systems and economies. It has been estimated that approximately 10%-20% of people that were infected by SARS-CoV-2, develop Long COVID. Countries within the European Union and elsewhere have been responding to Long COVID in various ways. Some countries initiated a more extensive response to Long COVID, including the creation of multidisciplinary Long COVID clinics. In other counties, Long COVID should be addressed within existing infrastructures within the health care system, which can be hampered by the siloed approach of how services for people with chronic conditions is organised. Moreover, a coordinated and uniform response to Long COVID is complicated by the fact that there is a large variety of terms and definitions of Long COVID and the fact that long COVID symptom are often similar to symptoms of other diseases, thus hampering specific characterisation of patients. While substantial progress has been made in understanding Long COVID we still need more answers about its causes and the most effective treatments. It is also important to understand the impact that Long COVID has on individual lives of those who are being affected - and their families - as well as on societies as a whole. The session aims to take stock of a number of recent insights relating to Long COVID, also with the purpose to identify opportunities for a more coordinated and harmonized approach towards Long COVID at national and international levels. The session will provide room for discussions and engagement with the audience, allowing to help inform future policy agendas. As such, better ways to understand and address Long COVID can also be beneficial for health systems as a whole, given the parallels with how services are provided and policies are set up to address other chronic (non-communicable) diseases.

Key messages:

- Long COVID is still poorly understood, in part relating to the complexity of the condition, also having considerable impacts on individuals and societies.
- A more harmonised response can help improve the manners to address it, this to support those still suffering from this long term impact of the COVID-19 pandemic.

Abstract citation ID: ckae144.500

The Network of Expertise on Long COVID as a means to synthesise intelligence and improve our response to long COVID at EU level

Stefan Schreck

I Van Der Heide[1]
[1]DG SANTE, European Commission, Luxembourg, Luxembourg
Contact: Stefan.Schreck@ec.europa.eu

To promote international collaboration and strengthen EU and national-level responses to Long COVID, the Commission set up the Network of Expertise on Long COVID (NELC) in 2023. It brings together national institutions involved in Long COVID work, nominated by the Public Health Expert Group (PHEG) representatives of each Member State. The network provides a platform for exchanges of national experiences on diagnosis, treatment, and management of long COVID. The Commission and the NELC agreed on eight specific actions to be implemented to manage Long COVID. The development of a Long COVID definition is complex due to the diverse range of symptoms experienced by patients, and so working towards a unified EU case definition is the first action proposal. This will allow the development and implementation of a surveillance system on national and EU level to foster the knowledge on the actual scale and the symptomatology of Long COVID across the EU leading to a better comparability of health data at Union level. The proposal to develop and implement a training programme for healthcare professionals at EU level will allow for the exchange of expertise/training on Long COVID across Member States. The provision of clinical guidelines based on evidence to Member States will help manage Long COVID, and international collaboration will allow for the sharing of valuable information and data with third countries that have experience with Long COVID. The Commission will use the EU Health Policy Platform to create an open stakeholder group. This group will allow stakeholders and patient groups to express their point of view, and to share experiences. Assessing the far-reaching social and economic consequences of Long COVID across the EU will allow for more targeted social and economic policy responses from Member States. It is important that priority is given to research responding to the most urgent needs of health care systems, which is why the Commission aims to identify research needs.

Mapping Long COVID across the EU: definitions, guidelines and surveillance systems in EU Member States

Iris Van Der Heide

I Van Der Heide[1], *J Hansen*[1]
[1]NIVEL, Utrecht, Netherlands
Contact: i.vanderheide@nivel.nl

A mapping study had been conducted to provide insight into 1) Long COVID definitions, 2) guidelines and intelligence on diagnosis and treatment, and 3) surveillance systems, as used/implemented in EU Member States plus Iceland, Norway, the United States, Canada, New Zealand, and Australia. Findings show that most Long COVID definitions align with WHO or NICE criteria, although there are also notable differences between definitions. The study also found Long COVID guidelines for diagnosis and treatment in 21 out of 34 selected countries. Common elements include advocating a multidisciplinary approach, a central role for primary care, and the focus on rehabilitation. Some guidelines include recommendations for referral to specialised care and follow-up procedures. Guidelines also differ in their target audience and in terms of their focus specific symptoms or organ systems that are affected by Long COVID. When it comes to Long COVID surveillance systems only a limited number of (nine) registries were found. Five of the Long COVID registries are based on self-registration. As limited information is available for most registries, a detailed understanding of their structures and goals in comparison to others is hindered. In conclusion, the study underlines the interconnectedness of Long COVID definitions, the development of guidelines, and surveillance systems. Given the variability in definitions and the voluntary entry of patients into the existing registries, there are no good estimates yet of the total numbers of patients and the severity of their disease in EU Member States. Linking information from cohort studies and clinical trials may be necessary to provide the full picture of the burden of disease of Long COVID. Still, preliminary estimates indicate that a significant proportion of those infected with COVID-19 experience long lasting symptoms, leading to impaired quality of life, also placing a significant burden on national health systems in the future.

Assessment of the impact of Long COVID on labour market participation and potential economic effects in the EU

Alba De Leon Edo

A De Leon Edo[1]
[1]DG SANTE, European Commission, Luxembourg, Luxembourg
Contact: Alba.De-Leon-Edo@ec.europa.eu

This paper estimates the economic cost of long COVID through its direct impacts on the labour market. The direct implications of long COVID for affected individuals concern their capacity to work, and their productivity at work. Some individuals might continue to work, but at a lower productivity level, some might reduce their hours worked, including as a result of temporary absences, and some might stop working at all. To the best of our knowledge, so far, no study has explicitly addressed the impact of long COVID on the EU labour market. The present paper provides a tentative assessment using available estimates from surveys, clinical follow-up studies and model simulations of the prevalence of long COVID. This tentative approach yields an estimated negative impact on labour supply of 0.2-0.3% in 2021 and 0.3-0.5% in 2022. In person-equivalents, this means long COVID would have reduced labour supply by 364,000-663,000 in 2021 and by 621,000-1,112,000 in 2022, combining the effect of lower productivity, higher sick leaves, lower hours, and increased unemployment or inactivity. The lower bound of this range is close to a recent estimate put forward for the US (Abraham & Rendell, 2023). Available labour market data suggest a mixed picture when it comes to the impact of long COVID. Overall, the possible role of long COVID in the rising trend in sick leave, disability and activity-limiting health factors, warrants careful monitoring going forward, due to its potential impact on labour supply and labour productivity, and on public finances through increased social benefits, pensions, health care and long-term care expenditure.

8.I. Pitch presentations: Challenges and strategies for improving infectious diseases control

Abstract citation ID: ckae144.503

Developing a set of core items for assessing preparedness in Italy: a Delphi approach

Giuseppe Migliara

AMV Amicosante[1], V Baccolini[2], MR Vacchio[2], G Baglio[1], E Eugeni[1], C De Vito[2], G Migliara[3]

[1]Research Unit, AGENAS – Italian National Agency for Regional Healthcare Services, Rome, Italy
[2]Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy
[3]Life Sciences, Health and Health Professions, Link Campus University, Rome, Italy
Contact: gmigliara@gmail.com

Background: Effective pandemic management relies on preparedness and several tools are available for evaluation. However, due to differences in regional healthcare organization and structures, these may not accurately evaluate Italy's capacities. This study, part of a project funded by the Italian Ministry of Health, report on the development of an assessment tool capable of evaluating the preparedness to confront pandemics at the regional level based on the actions outlined by the Italian influenza pandemic plan.

Methods: A desk research was carried out for preparedness evaluation tools, consulting Public Health Agencies, and Google Scholar and Search. Tools evaluation items were extracted, associated with the Italian plan, and screened for relevance and data availability. Selected items were then subjected to a two-round Delphi procedure involving 18 stakeholders from academia, local health services, and national agencies. The agreement was assessed using a 10-point Likert scale, and defined as a mean score $\geq$8, and consensus as a score standard deviation (SD) $\leq$1.5. Items with mean score $\geq$ 8 and SD $>$ 1.5 after the first round were sent to the second round.

Results: A total of 6 tools were included in the study, from which 303 evaluation items matched the actions of the plan. After the screening phase, 122 indicators were deemed relevant and potentially available and sent to the Delphi procedure. Eighteen (14.8%) items reached both agreement and consensus in the first round, while another fifteen (12.3%) after the second. The 33 items covered all the domains of the national plan, especially Research and Development (21.1%) and Clinical Governance (15.2%).

Conclusions: The development of a set of core items that are agile, relevant, and readily available was facilitated by the involvement of stakeholders from different sectors. Moreover, adherence to the Italian pandemic plan should ensure that these items are deeply integrated into the unique context of the Italian regions.

Key messages:

- The Delphi process identified a narrow number of evaluation items with great consensus.
- Consensus was searched involving stakeholders from central authorities, local units, and academia.

Issue/Problem: Healthcare-associated infections are major global public health challenges. In Portugal, the prevalence of resistant Enterobacteriaceae is particularly alarming. Studies typically focus on hospitals and long-term care facilities, neglecting community settings where patients, particularly the elderly with multiple comorbidities, often transition between hospital and home.

Description of the problem: Effective control measures are vital across all healthcare environments. In home care, sporadic implementation of Contact Precautions, due to the lack of specific guidelines and challenges in accessing colonization information, has been a major gap. This project aimed to close this gap by integrating a software, previously used only in hospitals, to enhance infection control in domiciliary care. The intervention adapted contact transmission-based precautions for home settings and used data from the previous year's infections and colonization to tailor recommendations for each patient, preventing transmission between homes and enhancing caregiver education.

Results: Preliminary data from a two-month monitoring period involved 40 patients under the care of three domiciliary teams. Eleven had records of infections involving 19 microorganisms, including 7 Enterobacteriaceae, five of which were carbapenemase producers. This led to five customized recommendations for improved precautions. The intervention also heightened nurses' awareness of patients' microbiological histories, evidenced by increased inquiries to the infection control team.

Lessons: Adapting measures to the unique dynamics of home care, distinct from hospital settings, is critical. Involvement of care teams in decision-making ensures practical adherence and enhances measure effectiveness. Regular monitoring is crucial for compliance, making this approach a model for other settings.

Key messages:

- Adapting hospital protocols to community settings and offering close support to caregiving teams increases compliance.
- Implementing software that facilitates communication about infection and colonization enhances infection control effectiveness in community settings.

Excess mortality in individuals with and without COVID-19 vaccination in the Netherlands in 2021

Corinne Rijpkema

C Rijpkema[1], M Heins[1], I Bos[1], L Ramerman[1], RA Verheij[1,2,3], K Hek[1]
[1]NIVEL, Utrecht, Netherlands
[2]Health Care Institute Netherlands, Diemen, Netherlands
[3]School of Social and Behavioral Sciences, Tilburg University, Tilburg, Netherlands
Contact: c.rijpkema@nivel.nl

Background: The COVID-19 pandemic greatly affected public health, evident in higher mortality rates in 2020-2022. COVID-19 vaccinations reduced global mortality, though this may vary across subpopulations. We aimed to study the role of COVID-19 vaccination in excess mortality by examining individuals with and without COVID-19 vaccine while accounting for characteristics such as income and frailty.

Methods: In this observational study, electronic health record data from general practitioners participating in the Nivel Primary Care Database were linked to demographic data and COVID-19 vaccination data. Patients were categorized in age groups, based on vaccination invitation dates, with the index date set as vaccination date for vaccinated individuals and the expected vaccination date for nonvaccinated ones. Expected mortality rates were calculated using 2015-2018 data, accounting for season, sex, income, migration background, palliative care, and frailty. We compared expected mortality to observed mortality in 2021 to determine excess mortality.

Results: Preliminary results show that nonvaccinated individuals (n = 160.253) were younger, and less frail, but more often received palliative care than vaccinated individuals (n = 819.363). In nonvaccinated individuals, excess mortality in the three months after expected vaccination ranged from 22-61% for 36-60 year olds to 209-233% for the 81+ year olds. In vaccinated individuals, excess mortality ranged from -64- -61% in 36-60 year olds to 2-4% in 81+ year olds. When not correcting for palliative care, excess mortality estimations increased significantly in nonvaccinated individuals (e.g. for 81+ year olds: 504%-514%).

Conclusions: Excess mortality was hardly present in vaccinated subgroups, while it was high in all nonvaccinated subgroups. Our study shed light on characteristics of nonvaccinated individuals, who require special attention during future vaccination programs to prevent excess mortality.

Key messages:

- Excess mortality in the three months after (expected) COVID-19 vaccination was high among nonvaccinated individuals and hardly observed amongst vaccinated individuals.
- Routine care data could help identify terminally ill individuals, who are overrepresented amongst nonvaccinated individuals, and mitigate the so called healthy vaccinee bias in vaccination research.

Systematic review of the literature about immunogenity and antibodies persistance of Tdap vaccination

Linda Bartucciotto

L Bartucciotto[1], C Genovese[1], G La Spada[1], I Saia[1], C Rizzo[1], R Squeri[1]
[1]BIOMORF, University of Messina, Messina, Italy
Contact: lindabartucciotto@gmail.com

Introduction: In industrialized countries, routine use of pertussis vaccines has shifted the burden of pertussis disease from children to infants, adolescents and adults, leading to the necessity of booster doses.

Materials and methods: We prepared the review following the Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) with the aim of a) to describe the immunogenity of the main available vaccines for adolescents and adults b) to describe antibodies persistance after immunization with the main vaccines available in childhood and adults and, also, possible co-administration and c) to identify the gold standard for adolescent and adult immunizations.

Results: Of 6906 records identified, after removing duplicate records, 12 RCT were included (people aged 11-73): of these 7 studies had only 1 control group, 4 studies had 2 control group and 1 had 5 control group; moreover, of the 12 studies included only 2 regarding co-administration and all were about immunogenity. 9 out 12 studies had a Jadad score above 3 points and 10 out 12 meet the criteria of Cocrane Back Review Group Criteria List for Methodological Quality Assessment.

Discussion and conclusions: We found a limited number of good-quality RCTs investigating our object. The five component vaccines, although containing a lower dosage of antigen, are found to be more effective than one components vaccines for prevention. Evidences support the use of 5- components vaccines for booster sessions in adolescence and adulthood.

Key messages:

- Although 3-component and 5-component vaccines contain a lower dose of antigen, they are more effective than 1-component vaccines in the prevention of diphtheria-tetanus and Bordetella pertussis.
- The robustness of the data and the analytical tests support the use of vaccines with reduced antigen concentration for decennial booster sessions in adolescence and adulthood.

Impact of artificial intelligence on healthcare-associated infection control: a systematic review

Chiara Barbati

C Barbati[1], L Viviani[1], R Vecchio[1], G Arzilli[2], L De Angelis[2], F Baglivo[2], C Rizzo[2], A Odone[1]
[1]Department of Public Health, University of Pavia, Pavia, Italy
[2]Department of Translational Research, University of Pisa, Pisa, Italy
Contact: chiara.barbati01@universitadipavia.it

Background: Healthcare-associated infections (HAIs) represent a significant public health concern, correlating with increased morbidity, mortality rates and healthcare expenditures. While artificial intelligence (AI) systems offer transformative potential in enhancing HAIs detection and control practices, the actual performance effectiveness of these systems remains uncertain. This systematic review updates a previously published study from 2020 and evaluates the performance of AI-based tools for surveillance, detection, and control of HAIs.

Methods: PRISMA 2020 guidelines were applied. The study protocol has been registered in PROSPERO (ID: CRD42024513145). PubMed, Embase, Scopus and Web of Science were searched for experimental and observational studies assessing the performance of AI-based tools to detect and control HAIs, published in English.

Results: From 8,701 articles initially identified, 4,212 records were removed due to duplication. Out of 4,489 papers screened, 147 were included. Studies reported performance measures including sensitivity, specificity, positive and negative predictive values, area under the receiver operating characteristic curve, accuracy, precision, F1 score. Significant heterogeneity was found in the types of technology, infections targeted, health care settings and data sources between studies.

Conclusions: The increase in published evidence since the previous review reflects the growing interest and use of new technologies such as Large Language Models, showing promising performance in surveillance, early diagnosis and prediction of HAIs. However, the observed heterogeneity in study designs, targeted infections, healthcare settings, and data sources underscores the need for standardised methodologies and robust validation processes to ensure the reliability and comparability of results across different studies.

Key messages:

- The use of AI-based tools has the potential to enhance surveillance, detection, and control of healthcare-associated infections, offering a transformative impact on healthcare systems.
- Standardised methodologies and validation processes are needed to ensure comparable results across studies and to maximise the real-world impact of AI tools in HAI surveillance and control efforts.

[3]Fondazione Toscana Gabriele Monasterio, Pisa, Italy
Contact: francesco.baglivo94@gmail.com

Background: Surgical site infections (SSIs) pose a significant threat in cardiac surgery (CS), profoundly impacting patient prognosis. SSI incidence varies widely, reported between 3.5% and 26.8%. The study used a decade-long dataset from SSI surveillance in a specialized hospital in Italy, applying machine learning (ML) techniques to predict the SSI incidence among CS patients.

Methods: Data collected from 2013-2023 through the surveillance system of SSI in patients undergoing CS were used to train a predictive ML algorithm (XGBoost). Data included information on demographics, risk factors, surgery variables (incision site, prophylaxis, etc.), and the infection outcome derived from follow-up interviews at 30 days post-surgery, or 90 days for patients with prosthetic materials, according to the ECDC case definition of SSI. We used the R libraries "caret", "smotefamily" and "xgboost" to train the algorithm. A train-test split of 70-30 was applied. Both downsampling of the majority class (no SSI) and oversampling of SSI cases with SMOTE were used in the training set to address class imbalance.

Results: A total of 10,534 subjects (65.9% males, mean age 68.3 years) who underwent CS (64.3% with prosthetic materials) were included, among which 533 SSIs were identified (mean incidence of 5.06%), with 430 cases (80.7%) occurring after discharge (38.7% deep SSI) and 103 (19.3%) before discharge (55.5% deep SSI). The trained XGBoost algorithm achieved an AUC of 0.62, sensitivity of 69%, and specificity of 50% in the prediction of SSI on the test dataset.

Conclusions: These findings suggest that while the XGBoost model provides a fair predictive capability, there is significant room for improvement in sensitivity and specificity. The use of artificial intelligence offers a promising opportunity to identify patients at risk of SSI. However, further research and comprehensive data are needed to refine the predictive model and effectively improve prevention measures.

Key messages:

- Predominantly occurring post-discharge, SSIs in cardiac surgery necessitate enhanced prevention strategies, highlighting the critical phase after hospital discharge where surveillance is paramount.
- Artificial intelligence may enhance post-discharge SSI surveillance, promising to identify patients at increased risk. Further research is needed to refine these AI tools for optimal sensitivity.

Characterising Long COVID in an Irish cohort: a study of symptom type, severity and determinants

Fiona McGuire

F McGuire[1], *U Fallon*[1], *P Kavanagh*[2], *P Carney*[1]
[1]Public Health, Health Service Executive, Tullamore, Ireland
[2]Public Health, Health Intelligence Unit, Dublin, Ireland
Contact: fiona.mcguire@hse.ie

Long COVID (LC) is a multisystem disorder impacting 65 million people globally. This secondary analysis of data from the Follow-up After Disease Acquisition (FADA) retrospective cohort study of COVID-19 recovery, aimed to characterise the nature and severity of LC in an Irish sample. The Modified COVID-19 Yorkshire Rehabilitation Scale categorised symptoms. Data analysis employed descriptive statistics and logistic regression. Of 4,671 respondents, 2,338 (50.1%) self-reported LC. LC participants were predominantly female (1,543, 66%), White Irish (1,512, 84.9%), and highly-educated (1,174, 65.8%). 907 (51.5%), had ≥one baseline co-morbidity. Most (1,076, 59.1%) had never smoked. Only 6.9% (162) of LC cases were ever hospitalised with acute COVID-19. Recovery was reported by 979 (41.9%). Of those with persistent symptoms 306 (31.6%) were classified as "moderate/severe." Fatigue was predominant, (1,021, 75.1%) accompanied by cognitive dysfunction (932, 68.5%) and breathlessness (870, 64.0%). Functional impairment, assessed by the EQ-5D-5L score, was evident. Factors associated with LC persistence and severity included baseline co-morbidities (aOR persistent LC 1.44 [95% CI 1.12-1.85], $p = 0.005$; aOR moderate/severe LC 2.90 [1.92-4.37] $p < 0.001$)), smoking (aOR persistent LC 1.59 [1.11-2.28] $p = 0.01$, aOR moderate/severe=1.65 [1.0-2.71] $p = 0.05$), and meeting/exceeding WHO's physical activity guidelines (aOR persistent LC 1.49 [1.16-1.92], $p = 0.002$, aOR moderate/severe=1.69 [1.12-2.54], $p = 0.01$). LC's diverse symptomatology and functional impairment serve as a call to action to the health service to equip itself to address this complexity. This study offers insights into LC symptom type, duration, and determinants, emphasising the need for Public Health to traverse domains, to improve all facets of population health. These findings add to the current understanding of LC, providing a foundation for the development of tailored LC services.

Key messages:

- Long COVID causes a constellation of diverse symptoms.
- The Irish Health service needs to be equipped to manage the diverse symptomatologu.

[2]Bristol Trials Centre, University of Bristol, Bristol, UK

[3]Geriatric Medicine, Royal United Hospitals, Bath, UK
Contact: ruth.kipping@bristol.ac.uk

Context: There is evidence that portable high-efficiency-particulate-air (HEPA) filtration units remove microbial particles from the air, but it is unclear whether this is sufficient to reduce infections in care home residents.

Objectives: To investigate the effectiveness of portable HEPA filtration units for winter respiratory infection episode reduction in care home residents. Study design and analysis: Cluster controlled trial with intention-to-treat analysis. Setting: 90 residential care homes for older adults in England. Population: Residents expected to reside in the care home for ≥ 1 month. Intervention care homes: Five HEPA filtration units in communal rooms and one HEPA filtration unit in 10 to 16 bedrooms. Control care homes: Usual care. Outcome measures: The primary outcome is the number of symptomatic winter respiratory infection episodes recorded by care home staff. Secondary outcomes: other infection measures; falls /near falls; laboratory confirmed infections; hospitalisations; and staff sickness. Process evaluation to assess intervention acceptability and implementation.

Results: Care homes were randomised between January 2022 and February 2024, 43 to intervention and 47 to usual care. Respectively, in intervention and control group care homes: 43% and 45% provided nursing care; 87% and 87% dementia care; and median (IQR) number of communal rooms were 4 (3-5) in both groups. 1126 residents were consented, of whom 31 (3%) moved away; 151 (13%) died; and 5 stopped participating. Primary outcome data is 98% complete with 175,318 'resident days' symptom data collected. Comparing intervention and control group residents: median (IQR) age was 88 (81-92) and 88 (82-92) years; 33% and 43% were receiving nursing care; 58% and 57% had dementia; frailty scores were 6 (4-7) and 6 (5-7); 94% and 94% received influenza; and 97% and 95% COVID vaccines.

Conclusions: Final analytic results of this world-first RCT will be available for the conference.

Key messages:
- This world-first RCT using HEPA filters in care homes will report the evidence of effectiveness of respiratory infection episode reduction in care home residents.
- The trial will inform policy makers about the effectiveness, acceptability and implementation of HEPA filters in care homes.

8.K. Scientific session: Promoting Healthier and Sustainable Diets – Evidence from the Interdisciplinary MedDietMenus4Campus

Abstract citation ID: ckae144.511

Organised by: University of Porto (Portugal), Lisbon School of Health Technology (Portugal)
Chair persons: Ada Rocha (Portugal), Marília Prada (Portugal)
Contact: claudia.viegas@estesl.ipl.pt

Food service comprises the production of meals consumed outside the home, including consumers from all age groups and in different sectors. This service sector has evolved through the years, providing an increasing number of meals, which have been drifting away from the Mediterranean Food Pattern. Food service is an important setting for public health interventions, educating consumers and modulating behaviours through the meals provided. Prior research on eating habits has mainly focused on a single stakeholder - typically consumers - and on a narrow set of outcome variables. Although these studies provide important clues about the determinants of adherence to food offer, research has yet to address this issue using an integrative approach of multiple stakeholders (e.g., the consumers, food providers, and decisors) across a set of different variables. Also, intervention initiatives, usually act only on the environment without strategies that efficiently engage all the stakeholders involved. In contrast, to promote behavioral change this research will focus on Social Marketing as it has been acknowledged as an effective strategy to enhance the health and well-being of consumers. Establishing and managing long-term partnerships that include different groups of stakeholders - consumers, government, retailers, and other players - are key elements in the application of mid and upstream social marketing to complex issues. The project's main ambition is to change the food service paradigm, by creating and implementing a new healthy and sustainable food service concept complying with the Mediterranean diet, as well as solutions that comply with consumers' new needs, and also developing and implementing strategies that engage all the stakeholders with this concept. We expect to create the reference in terms of food offer that will be demanded by consumers of the next generations and the standpoint to inspire the other food service sectors/ settings to achieve an effective and sustainable food offer change and positively influence food service consumers' food patterns towards Mediterranean recommendations. In this workshop, the findings of the project will be presented focusing on examining the barriers and facilitators of adherence to the Mediterranean Diet in the menus offered in public high education institutes canteens in Portugal, Turkey, and Croatia. To promote the identification of effective intervention pathways, we take on an interdisciplinary approach, integrating the theoretical and methodological frameworks of Nutrition, Psychology, and Marketing.

Key messages:
- Provide an overview of an interdisciplinary approach to promote healthier and more sustainable food offered in university canteens.
- Present the pathway to develop social marketing strategies to engage different stakeholders in effective food behaviour change.

Food service is an important setting for public health interventions, educating consumers and modulating behaviours through the meals provided. Social Marketing is one of the strategies designed to promote behaviour change, which contributions to health and well-being of consumers are widely recognised. This project aims to identify the compliance of food service menus with the Mediterranean Diet (MD) in public high education institutes

(HEI) canteens, pinpointing opportunities to intervene, namely: 1) promoting changes in the food offer addressing proximity to the MD, creating, and offering plant-based meals, with seasonable and local food products and 2) developing tailored social marketing strategies to engage stakeholders to encourage healthier and sustainable food habits. It gathers a team comprised of nutrition experts on public health and food service, food technologists, gastronomy experts, psychologists, and marketers. To achieve the objectives researchers will: 1) develop an index to evaluate compliance of menus with the MD; 2) define priority stakeholders and define a methodology for engagement; 3) evaluate perceptions, barriers and facilitators; 4) develop a meal plan framework; 5) develop a new food concept "student bag" (meal on the go) and test it for industry scale-up; 6) use previous diagnosis to develop social marketing strategies directed to stakeholders and consumers to achieve food behaviour change and 7) measure the impacts of the implemented strategies. This research intends to create and implement a new healthy and sustainable food service concept, expecting to define the standpoint to inspire other food service settings to achieve an effective and sustainable food offer change and positively influence food service consumers' food pattern towards Mediterranean recommendations, while addressing the Sustainable Development Goals (3 - good health and 12 - responsible consumption and production; 17 - partnerships for the goals).

The Mediterranean Diet (MD) is one of the healthiest food patterns associated with important health benefits. Acknowledging this, it's important to understand how the dietary patterns of the consumers align with the MD. Over time, different authors have formulated several indexes for this purpose. However, current indexes lack standardization, and they only evaluate the quality of the diet of individuals to be used by health professionals and political decision-makers. Although there are indexes to assess the food options at the restaurants, none of them assess the menu compliance with the MD. Due to the importance of the food services in the food choices and dietary patterns of the consumers, this research developed an index to assess the alignment of the food availability with the MD key points. To address this gap, after reviewing the existing indexes in the literature, the authors created a tool that assesses the degree of compliance of menus with the MD - MedCIn. This index is divided into 4 dimensions, the first one assesses the availability (part A) and variety (part B) of the food/food groups. The second dimension assesses the nutritional quality of the menus based on the nutritional declaration, the third dimension assesses the food portions and culinary options, and the fourth dimension allows the verification of the previous information on site. Although the use of all dimensions allows for a more comprehensive menu evaluation, dimension one can be used as a first approach MD compliance. The index is meant to be applied in a 4-week cycle, though it can be adapted for each food service. Validation of this tool included construct validity, internal consistency and inter-rater reliability, all of which returned high values (alpha-Cronbach=0.88; Coheńs Kappa=0.92). The researchers consider this a reliable tool to easily assess compliance of menus with MD key points, allowing for the identification of issues to be addressed and improved

[5]Department of Nutrition and Dietetics, Faculty of Health Sciences, Atilim University, Ankara, Turkey
Contact: ddikmen@hacettepe.edu.tr

Background: The Mediterranean Diet (MedD) is widely recognized as a health-promoting and sustainable dietary pattern. This study evaluated the environmental impacts of higher education institutes (HEI) menus via water footprint and the compliance with MedD in Croatia, Portugal and Turkey.

Methods: Water footprint calculation followed the methodology of Mekonnen and Hoekstra (2012). Adherence to the Med-Diet was evaluated using the Med-Diet Compliance Index (MeDCIn). All available options were considered, except for restrictions such as vegetarian, considering a 5-day/week and 1-meal/day menu. Menus spanning a two-week period were analyzed from two distinct HEI in each country.

Results: Mean water footprints varied across three countries (1213.9-2297.4 L/person). Turkish HEI 1 (2297.4 L/person) and 2 (1934.2 L/person) exhibited the highest water footprints, while Croatian HEI 2 (1213.9 L/person) and Portugal HEI 2 (1308.6 L/person) had the lowest. MedDiet index scores ranged from 0.50 to 5.50. Portugal University 1 (5.5) and 2 (4.5) scored the highest, whereas Croatia University 1 (0.5) scored the lowest.

Conclusions: In the preliminary results, Portugal presented a lower water footprint and higher MedD adherence, possibly due to the higher use of seafood. The higher water footprint in Turkey might be due to more balanced servings of vegetables and fruits and significant portions of red meat. The low MedD compliance scores in Croatia can be attributed to insufficient fresh fruits, whole grains and pulses, and the low water footprint related to the use of ready-made desserts and soup powders not included in the water footprint database.

Stakeholders engagement model- Social Marketing strategies to improve students' eating behaviour

Liliana Ferreira

L Ferreira[2,3], B Monteiro[1], M Nogueira[1], S Gomes[1]
[1]Instituto Português de Administração de Marke, Porto, Portugal
[2]GreenUPorto, Sustainable Agrifood Production Research Centre, Porto, Portugal
[3]Faculdade de Ciências da Nutrição e Alimentação, Universidade do Porto, Porto, Portugal
Contact: lilianaferreira@fcna.up.pt

Previous studies have adopted the social marketing framework to investigate change behaviours towards healthier eating habits. However, despite the unequivocal link between Mediterranean Diet and healthy eating, the adoption of social marketing strategies to foster the adherence to such food pattern, remains unexplored, particularly in the context of HEIs. One research goal was to develop a stakeholder engagement model, in order to better craft social marketing strategies aligned with stakeholders' needs. Hence, as different stakeholders call for different engagement designs, we consider that crossing the Social Marketing Framework with the Stakeholder Engagement Model, provides a solid basis to understand how to engage key stakeholders in the implementation of a program aimed at changing and influencing healthier eating habits aligned with the Mediterranean Diet within public HEIs canteens. Behavioural change in such contexts, demands a systemic and holistic approach, able to engage a diverse range of stakeholders, beyond those whose behaviour is expected to change. Social Marketing provides a strategic framework to promote behavioural change towards collective welfare. In the specific context of public health interventions towards healthier eating habits, this framework has been particularly useful. Hence, in-depth understanding on which stakeholders need to be involved in the social marketing process and at what stages, may yield insights into why some interventions change behaviour and why others do not. Findings revealed that it is not enough to create a single stakeholder engagement model throughout the social marketing plan in a more global perspective, as if one solution fits all. This study highlights the importance of designing glocal social marketing strategies, embedding glocal models of stakeholder engagement: standardizing the tools and practices that are possible and adapting what is necessary so that it has success in different national realities

Abstract citation ID: ckae144.516
Students' Perceptions of Food Offer in Portuguese Canteens and Adherence to Mediterranean Diets

Cristiane Souza

C Souza[1], M Prada[1]
[1]Department of Social and Organizational Psychology, Iscte-Instituto Universitário de Lisboa, Lisbon, Portugal
Contact: Cristiane_Anunciacao_Souza@iscte-iul.pt

Adherence to healthy eating behaviors, as in the Mediterranean Diet, is related to a better quality of life, better educational performance, and reduced risk of physical illness among higher education students. The provision of good quality and sustainable food is imperative in university environments. Nevertheless, the availability of healthy options tends to be limited across campuses (e.g., affordable fast food; the convenience of high-sugary foods in vending machines), including university canteens. Understanding students' views on canteens and the factors that prevent them from embracing healthy eating habits may help to improve the food supply on campuses. In the present study, we aimed to examine students' perceptions of canteen services and its food supply and to verify students' knowledge and promptness to comply with a Mediterranean Diet menu. A large sample of academic students from Portuguese universities answered an online survey with a mixed approach. Specifically, participants were requested to characterize their dietary practices and report their perceptions about food services and offers in campus canteens. Additionally, students were asked about their knowledge, perceptions, and adherence to Mediterranean Diet. Our findings allow us to map perceptions and attitudes regarding food offered in university canteens and to identify the potential to adhere to more sustainable and healthier food patterns according to individual. Moreover, we identified the main psychological and environmental barriers to adhering Mediterranean Diet. Correlational data indicated a relationship between health-related measures and food-related factors. Advancing data about modifiable factors associated with better adherence to healthy dietary habits in the university context informs the development of actions/interventions to prevent unhealthy food choices and overcome limited and unhealthy food offers in canteen campuses.

Introduction: Tobacco is responsible for approximately 8 million deaths annually worldwide, with 1.2 million resulting from passive exposure to smoke, as reported by the WHO. Comprehensive tobacco control policies have been enacted across Europe, yet their impacts are seldom assessed. This study evaluates the effects of the anti-tobacco legislation enacted in Portugal in 2007 on tobacco-related hospitalizations between 2002 and 2018.

Methods: Data from all in-patient admissions in public hospitals throughout the 2002-2018 period were utilized. A quasi-experimental interrupted time series design was employed, treating 2008 as an exogenous shock. The dependent variables include the municipality-based incidence of hospitalizations by year for tobacco-related diseases, namely, Acute Myocardial Infarction, stroke, lower respiratory tract infections, chronic obstructive pulmonary disease, and asthma. The analysis was adjusted for the percentage of women, the percentage of individuals aged over 65, and purchasing power in the municipality. Time trend graphs for each variable were generated, followed by an adjustment using the Poisson regression model to forecast their trends. A comparison was conducted between observed post-law implementation data and projected values from the regression model to ascertain the percentage difference between the two. Expected

Results: The 2007 tobacco law led to significant reductions in tobacco-related disease incidence, with the most notable effects immediately post-implementation. The impact varies across age groups, with younger individuals (30-49 years) showing a sharper decrease. The effect diminished over time, as indicated by negative coefficients in time:law interactions, such as -0.03.

Conclusions: The anti-tobacco laws implemented in Portugal have effectively decreased hospitalizations related to tobacco use, suggesting potential increases in life expectancy and reduction in health system burden.

Key messages:

- Public health policies are crucial for the long-term improvement of people's health.
- Non-exposure to tobacco can bring health gains on several levels.

Measures to increase the retention of migrant healthcare professionals in Germany

Eva Jansen

E Jansen[1], *L Peppler*[1]
[1]Institute of Medical Sociology and Rehabilitation Science, Charité - Universitätsmedizin Berlin, Berlin, Germany
Contact: eva.jansen@charite.de

Background: The shortage of skilled workers in the healthcare sector is a pressing issue in Germany that has been worsening in recent years. It is often compensated by the deployment of specialists from abroad. However, this is accompanied by various challenges. This article synthesizes challenges from nine years of research and proposes approaches to solutions that have proven successful in practice in Germany as well as in international settings.

Methods: The insights presented here condense the results from a total of six research projects (four on physicians and two on nursing). The research projects are based on exploratory qualitative interviews, quantitative questionnaires, mixed-methods designs, and the generation and testing of measures that can help with the integration of foreign skilled workers.

Results: The main challenges for migrated skilled workers are inadequate language and communication skills, lack of knowledge about the national healthcare system, disease and therapy concepts, unfamiliar forms of inter-hierarchical and inter-professional collaboration, a lack of understanding of administrative and bureaucratic processes and social integration. The following measures have proven successful in Germany and abroad: increasing social integration of physicians (e.g. through partner or peer programs), streamlining systems, establishing professional structures for the integration of foreign skilled workers, and creating a positive work environment.

Conclusions: Compared to findings from international studies, in Germany the hurdles of administrative processes, the peculiarities of the healthcare system (e.g. social medicine), and learning the language are considered to be the highest. It is important to counteract these challenges with appropriate measures in order to prevent a migration of healthcare professionals already in Germany to (mostly English-speaking) foreign countries.

Key messages:
- In Germany the hurdles of administrative processes, the peculiarities of the German healthcare system (e.g. social medicine), and learning the German language are considered to be the highest.
- It should be considered to no longer leave the migration of healthcare staff to individual integration efforts, but to create appropriate government structures that focus on their social integration.

Abstract citation ID: ckae144.519
Learning through playing in public health: a card game's evaluation

Jessica Martinez

J Martinez[1,2], *M Cottin*[1,2], *R Valter*[1,2], *H Razafindrakoto*[1], *S Vauxion*[1], *L Josseran*[1,2], *E Delarocque-Astagneau*[1,2], *S Gautier*[1,2]
[1]Faculty of Health Sciences Simone Veil, University of Versailles, Montigny-le-Bretonneux, France
[2]Department of Public Health, Raymond Poincaré Hospital, Garches, France
Contact: jessica.martinez@aphp.fr

Background: In medical education and particularly in public health, the shift toward active learning addresses the limitations of traditional lecture-based methods. Game-based learning, such as serious games, showed potential to overcome these limitations. "Accidémie" is a card game designed to improve medical students' knowledge of home accidents and their competencies in public health through an interactive format. This study aims to evaluate the effectiveness of "Accidémie".

Methods: We conducted a quantitative pre-post assessment study among sixth-year medical students of the University of Versailles. Data were collected through a 20-item true/false repeated questionnaire before and after. In addition, the post-intervention questionnaire included questions on students' satisfaction and an open-ended question. Responses to the questionnaires were converted into scores. The main outcome measured was the change in the scores. The scores before and after the intervention are presented with their mean and standard deviation. They were compared using a paired t-test. Student satisfaction is presented in terms of frequency and includes verbatim responses from the students.

Results: Thirty-eight students participated, with pre-test scores averaging 13.13 ($SD = 1.98$) and post-test scores averaging 14.89 ($SD = 1.94$). A paired t-test provided statistical evidence of the difference between the pre- and post-test scores ($p < 0.001$). Students provided positive feedback: 81.6% of the students were very satisfied with the game; 42.1% considered it extremely useful. They also underlined that 'Accidémie' is an enjoyable learning tool, praising its innovative approach.

Conclusions: "Accidémie" improved students' knowledge of home accidents and their engagement. It supports the use of serious games in medical education complementary to traditional methods. Applying the concept of "Accidémie" across various subjects and among diverse groups of health students offers promising prospects.

Key messages:
- 'Accidémie' significantly improves students' knowledge of home accidents, a public health topic.
- "Accidémie" allows medical students to learn while playing, boosting satisfaction and engagement.

Abstract citation ID: ckae144.520
Smoke-Free Policies and Cigarette Consumption Impact on Myocardial Infarction Mortality in Europe

Roberta Pastorino

R Pastorino[1], *M Sassano*[1,2], *M Mariani*[1], *S Boccia*[1]
[1]Section of Hygiene - Institute of Public Health, Università Cattolica, Rome, Italy
[2]Department of Medical and Surgical Sciences, University of Bologna, Bologna, Italy
Contact: roberta.pastorino@unicatt.it

Background: Limited evidence exists on the association between smoke-free policies and per-capita cigarette consumption and mortality due to acute myocardial infarction (AMI) in Europe. Therefore, our study aimed to assess this association and evaluate influencing factors.

Methods: We conducted an interrupted time series analysis involving 27 European Union member states and the UK, examining per-capita cigarette consumption and AMI mortality. A multivariate meta-regression assessed potential influencing factors.

Results: Approximately half of introduced smoke-free policies were associated with level or slope changes, or both, in per-capita cigarette consumption and AMI mortality (17 of 35). Notably, the smoking ban in Poland in 2010 resulted in the most substantial level reduction in cigarette consumption (rate ratio (RR): 0.47; 95% CI: 0.41, 0.53), while the intervention in Bulgaria in 2012 led to the largest level reduction in AMI mortality (RR: 0.38; 95% CI: 0.34, 0.42). More recent policies or those from countries with lower human development indices were linked to greater decreases in cigarette consumption. Furthermore, smoking bans encompassing bars exhibited a stronger inverse association with both cigarette consumption and AMI mortality.

Conclusions: Our findings indicate the effectiveness of smoke-free policies in reducing per-capita cigarette consumption and AMI mortality. Continued monitoring and data collection on tobacco, prevalence, and consumption are crucial for concerted efforts to address its health impacts.

Key messages:

- Smoke-free policies lower cigarette consumption, reducing heart attack deaths in Europe.
- Monitoring tobacco data crucial for health efforts: Study shows smoke-free policies save lives.

Abstract citation ID: ckae144.521
Sociodemographic, work- and health-factors predict rejection of vocational rehabilitation in Finland

Riku Louhimo

R Louhimo[1], *H Hautamäki*[1], *A Airila*[1]
[1]Varma Mutual Pension Insurance Company, Helsinki, Finland
Contact: riku.louhimo@varma.fi

Background: Vocational rehabilitation (VR) decreases the number of premature retirements. Pension insurance companies operate private sector employees' VR in Finland. In 2022, some 15,500 individuals received rehabilitation in this earnings-related pension system. However, the rejection rate was 46%. Similar systems exist throughout OECD. VR facilitates finding suitable work despite an illness. A person is eligible if a threat of disability exists within the next few years and non-medical requirements are met. Currently VR is underused. Thus, it is important to understand which sociodemographic, work- and health-related factors predict a VR rejection.
Methods: We had full application data from a Finnish insurer for 2015-20. Our data cover roughly 40% of the 2.7M person Finnish working population. We excluded applicants with preceding VR and only included under 58-year-old applicants rejected due to 'no risk for disability'. Our data comprised age, region of residence, salary, doctor's assessment grades, diagnosis, industry, and data on preceding sickness, unemployment and rehabilitation benefits. For analysis, we used logistic regression.
Results: After adjustment, younger age and mental disorders showed largest effects on rejection. Features associated with a less severe medical condition as well as decreased employment were significantly connected to rejection. Industry and place of residence showed no effect. Of note, stable employment and higher pay predict entry possibly due to more possible rehabilitation options and better health in general. Interestingly, people with multiple diagnoses are more likely to be rejected.
Conclusions: The work-ability of aging European populations could benefit from vocational rehabilitation that better suits mental disorders and younger people.
Key messages:

- Vocational rehabilitation (VR) is an underused method to maintain work ability.
- Our study identified groups that could benefit from tailored solutions in VR that decrease barriers to entry.

Abstract citation ID: ckae144.522
Innovative approaches to measuring and promoting employee vitality and sustainable employability

Background: Employers find it difficult to develop interventions for vitality and sustainable employability (SE), particularly for employees in low-skilled jobs. Measures based on the employee perspective on SE that would give direction to interventions fall short, and effective programs to improve vitality and SE in this group are lacking. This study aims (1) to get insight into the effect and implementation of an innovative organizational, dialogue-based approach 'Healthy HR' (HHR)* to promote job control and SE, and (2) to refine and further validate the Maastricht Instrument for SE (MAISE)-Easy (an HHR tool for needs assessment).
Methods: (1) An effect evaluation with a pretest-posttest design with a 1 year follow up (N = 71), and a mixed-methods process evaluation were conducted. Data were collected using questionnaires, interviews with employees and employers (N = 26), focus groups (N = 4) and logbooks. (2) A questionnaire containing the MAISE-Easy-items, proxy variables (health and vitality) and demographics was answered by 1223 employees from 7 organizations. Construct validity, reliability and criterion validity were tested through PCA, CFA, Cronbach's alpha and correlations.
Results: (1) A higher dose of HHR resulted in better job control and SE (n.s.). HHR had a positive impact on the awareness level of vitality and healthy workplaces of all stakeholders. (2) Reliability, construct and criterion validity of the MAISE-Easy were good, and MAISE-Easy 2.0 was constructed. This tool consists of 8 scales and 20 items divided over 4 areas: (1) Level of SE; (2) Factors affecting my SE; (3) Overall responsibility for SE; and (4) Responsibility for factors affecting my SE.
Conclusions: MAISE-Easy 2.0 is a valuable, valid and reliable tool in HHR which serves as a needs assessment for SE interventions. The innovative participatory approach HHR can improve job control and SE of employees in low-skilled jobs by giving them an active voice.
*doi.org/10.1186/s12889-021-11278-7
Key messages:

- Healthy HR (HHR) is an effective, organisational dialogue-based approach (online toolkit) to promote job control, vitality and sustainable employability (SE) of employees in low-skilled jobs.
- MAISE-Easy-2.0 (Maastricht Instrument for SE) is a new and thoroughly validated HHR tool for needs assessment, which measures SE and the responsibility for SE from the employee perspective.

8.M. Skills building seminar: Mental health and substance use in Europe

Abstract citation ID: ckae144.523

Organised by: EUPHA-PMH, European Union Drug Agency
Chair persons: Marija Jakubauskiene (EUPHA-PMH), Linda Montanari (Portugal)
Contact: marija.jakubauskiene@mf.vu.lt

The impact of social factors on individual and population mental health are well established (Kirkbride, et al., 2024). The same social factors may trigger the substance use behavior developing into substance use disorders. Mental health disorders can contribute to the substance use and substance use disorders with worsening effects over time (EMCDDA, 2016). This association between substance use, substance use disorders and mental health disorders is a key objective for the scientific consideration and policy development. Respective phenomena are universal and a broader perspective would be useful for a better understanding of how the issue of comorbidities of substance use and mental disorders are addressed on a European level. Identification of the substance use problem, especially among populations in vulnerable situations, like migrants, becomes utterly important. Heterogenous systematic reviews show that there is a need for socially and culturally refugee sensitive instruments to measure the substance use in migrants. Oftentimes substance use is followed by the substance use disorders and drug use related infections. Injecting drug use is also a risk factor for having drug use related infections, such as hepatitis B and C, HIV, tuberculosis. Assessment of risk behaviour patterns among people who inject drugs may contribute to a higher participation in treatment and health programmes, reduce the burden of substance use and tackle comorbidities of substance use and mental health disorders. The skill building seminar aims to increase the knowledge and capacities on substance use and comorbidities, applied methodological approaches and tools in different European contexts. This workshop will support researchers, policy makers, public health planners by providing evidence base to address substance use and mental health issues. The added value of this workshop is based on the structure, content and mode of presentations - presentations will be followed by questions from participants and short discussions. The workshop will start with the general introduction to the topic of comorbidities of substance use and mental health disorders (EUPHA-PMH and EUDA). Then the European level perspective on comorbidities of substance use and mental health disorders will be presented including recent policy developments (1 presentation by Linda Montanari, EUDA). It will be supported with research results from the study conducted in Germany on substance use assessment tool development in migrant population (2 presentation by Kim-Julian Behr, Germany) and behavioural risk factor assessment study among people who inject drugs in Lithuania (3 presentation by Marija Jakubauskiene, Lithuania).

Key messages:

- Participatory approach is useful to address the substance use problem in assessment tool development and further monitoring.
- Better understanding of comorbidity of substance use and mental disorders leads to a more effective prevention.

Abstract citation ID: ckae144.524
Comorbidity of substance use and mental disorders in Europe

Linda Montanari

L Montanari[1]
[1]Public Health Unit, European Monitoring Centre for Drugs and Drug Addiction, Lisbon, Portugal
Contact: Linda.Montanari@emcdda.europa.eu

‘Comorbidity of substance use and mental disorders’ refers to the co-occurrence of a substance use disorder (SUD) and another mental disorder (MHD) in the same individual: mental disorders can be a risk factor for SUD and SUD may affect the occurrence of MHD. The relevance of the mental health disorders among people who use substances is related not only to its high prevalence, but also to its difficult assessment, diagnosis, and management. The EUDA is the European Drug Agency (EUDA), a decentralised agency of the European Commission with the purpose to support the European member States to monitor, respond and be prepared to the challenges posed by the drug phenomenon, including the link between SUD and MHD. In 2015 the agency has published an overview on comorbidity of SUD and MHD where it discusses several issues regarding dual disorders, including: theoretical concepts and mechanisms of actions, tools for screening and clinical diagnosis, epidemiology and interventions available to address comorbidity in the European countries (EMCDDA, 2015). The European strategic policy documents in the drug area stress the importance of considering mental health in monitoring, evidence-based responses and training for professionals in the drug field (EC, 2021). During the COVID19 pandemic, due to the overall increased concern on mental health in the population, the EUDA conducted an ad-hoc study to its the impact on substance use and mental health, especially in people who use illicit drugs. Recent work has been done to improve the available epidemiological data on comorbidity in the current European drug monitoring tools and to describe models of care for the treatment of dual disorders in Europe. Further steps are being taken with the development of the recent new agency’s mandate.

Participative development of a culture-sensitive instrument to measure substance use in Syrian refugees

Kim-Julian Behr

K Behr[1], *J Lindert*[1]
[1]Hochschule Emden/Leer, Emden, Germany
Contact: kim-julian.behr@hs-emden-leer.de

Background: Rarely assessment instruments have been developed with end users such as refugees or those suffering from mental health conditions. Refugees’ experiences pre-, during, and post-flight are associated with various mental health problems including substance use disorders. Systematic reviews on the prevalence of substance use disorders in refugees worldwide show heterogeneous results. To address possible misclassification due to the lack of refugee-sensitive instruments we aimed to develop a refugee-sensitive instrument.

Methods: We applied a three-step triangulation study design. First, we conducted a three-stage delphi-process in 2019 and 2020. We recruited Syrian medical doctors for the study. Second, we conducted six focus group discussions with Syrian refugees and medical doctors. Third, we conducted expert checks with medical doctors and professionals providing psycho-social services for refugees. For all focus group discussions, audio recordings were translated and transcribed. Computer-assisted thematic analysis was performed applying a deductive approach with semantic coding.

Results: The refugee-sensitive instrument consists of seven domains of substance use: lifetime use of relevant types of substances, frequency, intensity, self-perception of, and situations posing a risk for substance use, ability to perform, craving, tolerance, and intentions to reduce or quit substance use.

Discussion: The instrument has been developed qualitatively, however, a limitation is that it could not be validated in a quantitative large sample of refugees. In spite of this limitation, this is - to the best of our knowledge - the first instrument that has been developed in a participatory approach together with end-users.

Outlook: The study suggests that developing assessment instruments in a participatory approach is feasible. Participatory development of assessment instruments is in line with the new paradigm of co-creation of mental health conditions management.

Substance use and risk behaviour patterns among people who inject drugs

Marija Jakubauskiene

M Jakubauskiene[1], *E Pridotkiene*[1], *B Rasimaite*[2]
[1]Faculty of Medicine, Vilnius University, Vilnius, Lithuania
[2]Drug, Tobacco and Alcohol Control Department, Vilnius, Lithuania
Contact: marija.jakubauskiene@mf.vu.lt

Background: Substance use and injecting drug use in particular are related to health damages, reduced quality of life and life expectancy. Injecting drug use is a risk factor for acquiring infectious diseases among people who inject drugs (PWID). The aim of the study was to assess the risk behavior related to the use of intravenous psychoactive substances among PWID in Lithuania.

Methods: In 2023 a cross sectional study using respondent driven sampling (RDS) of active intravenous drug users (n = 370) was conducted in 5 different sites across Lithuania. RDS is a sampling methodology based on peer-referral in underserved populations that cannot be sampled randomly. Descriptive statistical and regression analyses were conducted using SPSS 23.0.

Results: 78% of the sample were males, 22% - females. Age mean is 40.6 years, SD-7.7. The first injecting drug was used at the age of 18 (mode). 69% of PWID received drug dependance treatment at least once in life. 70% of the PWID in harm reduction services are also in the substitution therapy programmes. Fentanyl is the main substance for every second respondent which is injected 3 times a day and commonly used with alcohol (64%). 79% of PWID during the last injection used sterile needles and syringes. 45% of respondents reported overdosing during the last 12 months and half of all PWID had naloxone for death prevention. Nearly 70% were tested for TB and syphilis during the last 12 months.

Conclusions: PWID are mainly males who began injecting drugs at 18 years. Unsafe injecting behaviour (frequency and mode), using alcohol were related to lower participation in health care services for PWID.

Main messages:

- Lower participation in health care services is related to behavioural risk factors.
- Ongoing research is needed to assess the factors determining engagement into healthcare of PWID.

8.N. Scientific session: Transferability and adaptation of vaccination interventions: Learning from underserved communities

Abstract citation ID: ckae144.527

Organised by: RIVER-EU
Chair persons: Tamara Schloemer (Netherlands), Janine De Zeeuw (Netherlands)
Contact: tamara.schloemer@maastrichtuniversity.nl

Removing barriers in the health system that make it difficult for cultural, religious or ethnic minorities to access vaccinations is an urgent concern in order to prevent infectious diseases in the future. Childhood vaccine uptake for MMR and HPV in most underserved communities is lower than in the general population. The project RIVER-EU (Reducing Inequalities in Vaccine uptake in the European region - Engaging Underserved communities) engages the migrant community in Greece, females with a Turkish or Moroccan migration background in the Netherlands, the Ukrainian minority in Poland and marginalized Roma communities in Slovakia to remove health system barriers to vaccination. Barriers include, e.g., lack of culturally and linguistically appropriate information, financial barriers, insufficient capacities, coordination and delivery of health care. Based on a Participatory Action Research (PAR) approach we selected and adapted potentially transferable evidence-based interventions in partnership with the communities. First, we pre-selected 6 useful interventions from a realist review on 36 effective vaccine uptake interventions. Second, we assessed them in depth for their transferability. Building a bridge between evidence on interventions and community needs is not an easy task: We involved various stakeholders in a longitudinal process under consideration of contextual conditions in the primary intervention context and the context of the respective underserved community. We co-created knowledge through 25 workshops and 39 interviews or focus groups for decision-making and determining need for adaptation of selected interventions. The aim of this workshop is to present the results of this co-creative process in each country. Special attention is payed to facilitators and barriers for transferability of evidence-based interventions from the perspective of underserved communities, and contextual commonalities and differences that lead to a specific intervention tailoring. This workshop will contribute to an improved understanding of how to consider contextual needs underserved communities have to remove health system barriers to vaccination on the one hand and suitable evidence on interventions to improve their situation on the other hand. The workshop will include five presentations of eight minutes and a questions and answers session to involve the audience. First, an introductory presentation on transferability of interventions for HPV and MMR vaccine uptake to underserved communities in specific contexts will be given. Then each country will present the intervention(s) to address health system barriers adapted to their context. Thereby, we will underline common key elements that have potential for transferability in all countries. After all presentations, we will discuss the need for context-based decision-making on evidence-based interventions and intervention tailoring to improve vaccine uptake for cultural, religious or ethnic minorities.

Key messages:

- Improving vaccine uptake in underserved communities requires local solutions with tailored interventions. Trusted partnerships with various stakeholders are key to reducing health system barriers.
- Participatory approaches to evidence-informed decision-making build bridges between evidence on interventions and needs of underserved communities to understand the transferability of interventions.

Background: Removing health system barriers to childhood vaccination is an urgent matter in the migrant community in Greece, the Turkish and Moroccan communities in the Netherlands, the Ukrainian minority in Poland, and the marginalized Roma community in Slovakia. The objective of this study was to select and adapt potentially transferable evidence-based interventions for HPV and MMR vaccine uptake in partnership with the underserved communities.

Methods: Using a participatory approach, we assessed transferability of six pre-selected interventions with the Population, Intervention, Environment and Transfer (PIET-T) models: All countries investigated two interventions with trained community members to support vaccination as health promoters. Greece and the Netherlands included a school-based vaccination program. The Netherlands added two interventions addressing providers' HPV vaccine communication, and Slovakia a multilevel intervention.

Results: We identified barriers and facilitators for successful intervention transfer in each of the target contexts. The transferability analysis showed that an intervention with health promoters is potentially transferable with adaptations in all countries. Principles of trust in the educator, tailored and trustworthy information, help in navigating the health system for vaccination and easy access at no cost are transferable key elements in all contexts. Adaptations refer to the intervention elements that need to be tailored to specific contextual needs. School-based vaccination was nowhere transferable. Health provider training needs to be culturally sensitive and adapted to the Dutch system. The multilevel intervention in Slovakia is not fully transferable.

Conclusions: Participatory transferability analysis was essential for decision-making and intervention adaptation. All countries independently selected a health promoter intervention as having potential to remove the identified health system barriers in the respective context.

Contact: p.karnaki@prolepsis.gr

Background: Migrant children in Greece face significantly lower vaccination coverage rates for MMR and HPV compared to their counterparts. To address this disparity, our research focuses on selecting and adapting evidence-based interventions tailored to the specific needs of different migrant communities staying in Greece, guided by the PIET-T framework.

Methods: Using a stakeholder-engaged approach, we involved 26 key stakeholders to select evidence-based interventions relevant to the Greek context. These interventions underwent detailed analysis, considering their effectiveness, cultural appropriateness, and potential for transferability within the PIET-T framework. Key stakeholders provided input on intervention feasibility and country- and context-specific adaptation.

Results: Three interventions were identified as promising for MMR and HPV vaccination uptake: two health promoter interventions and a school-based vaccination one. The health promoter intervention was adapted so to involve health professionals and trusted community members delivering culturally sensitive education and navigation support, addressing barriers such as language and lack of information. The original school-based program implements education sessions and on-site vaccinations, leveraging the trusted environment of schools to reach parents and children. On-site vaccinations were omitted since they were not relevant to the Greek context due to legal barriers.

Conclusions: Our stakeholder-engaged approach, guided by the PIET-T framework, ensures interventions are tailored to the specific needs and contexts of different migrant communities in Greece. By prioritizing cultural sensitivity and community involvement, we aim to enhance MMR and HPV vaccination uptake and improve health outcomes among migrant populations.

[5]Department of Applied Health Sciences, Hochschule für Gesundheit, Bochum, Germany
Contact: j.de.zeeuw@umcg.nl

Background: People with a Turkish or Moroccan migration background in the Netherlands have low HPV vaccination uptake. Health system barriers, including a lack of awareness raising initiatives on HPV, health care professionals being insufficiently trained to provide tailored care and insufficient delivery of HPV (vaccination) information, contribute to low uptake. To understand which promising interventions could be transferred, the interventions were discussed with a variety of stakeholders including community members.

Methods: By interviews and focus groups 33 key stakeholders were engaged to discuss on the promising evidence-based interventions. The interventions were extensively discussed on their effectiveness, cultural appropriateness, and potential transferability for which the Population-Intervention-Environment-Transfer Model of Transferability (PIET-T) model was used.

Results: Two interventions will be implemented of which one is focusing on the use of health promotors (trusted community members) who will provide parents of vaccine-eligible children with information on HPV and HPV vaccination. The educational sessions will be held together with health professionals in, for example, community centers or at schools. The other intervention focuses on training of healthcare professionals.

Conclusions: By engagement of key stakeholders including community members following the PIET-T model, final interventions could be developed that are tailored to the specific needs and contexts of people with a Turkish or Moroccan migration background in the Netherlands.

[4]Department of Applied Health Sciences, Hochschule für Gesundheit, Bochum, Germany
Contact: m.ganczak@inm.uz.zgora.pl

Background: Vaccination coverage in Ukrainian migrants' (UM) children is lower compared to their Polish counterparts. We aimed to identify and adapt effective evidence-based interventions which would address health system barriers to HPV/MMR vaccination in this community.

Methods: With the help of the Participatory Action Research (PAR) approach, 4 researchers, 6 experts, 6 UM, 7 Ukrainian GPs and 3 teachers identified and discussed transferability of promising HPV/MMR vaccination interventions and their adaptation from the Polish and contextual perspective. The Population-Intervention-Environment-Transfer Model of Transferability (PIET-T) model was used to accompany the steps for determining transferability.

Results: Three intervention elements were considered as capable for increasing HPV/MMR vaccination uptake: a health promoter, group educational sessions and an online provider training. Adaptations were needed to make them consistent with the contextual needs. The intervention was adapted to involve Ukrainian GPs delivering culturally sensitive education and a Ukrainian coordinator offering navigation support; barriers (lack of information/language barrier) were addressed. The education sessions for parents were taken into account as having potential to increase knowledge and facilitate making informed decisions regarding vaccination. The online education course was assessed as a strategy to possibly enhance GPs knowledge to let them make strong HPV/MMR vaccine recommendations to UMs.

Conclusions: Both, community-based PAR approach, and the PIET-T model, facilitated the assessment of intervention transferability and adaptation in terms of covering the individual context, pattern and needs of UMs community in Poland, to finally increase HPV/MMR vaccination uptake.

[4]Department of Applied Health Sciences, Hochschule für Gesundheit, Bochum, Germany
Contact: daniela.filakovska@upjs.sk

Background: Marginalized Roma communities (MRCs) are among underserved groups facing limited access to vaccination services and presumably low HPV vaccination rates. The most significant health system barriers to HPV vaccination include financial costs, lack of appropriate information and restricted capacities of healthcare providers. Two interventions identified as promising for implementation in the context of MRCs were discussed with a variety of stakeholders and community members to tailor intervention that would be well accepted and effective to increase HPV vaccination rates in MRCs.

Methods: The first intervention uses health promoters - trusted and trained community members to address cultural and language barriers and serve as a vital link between healthcare providers and community members. The second multilevel intervention is providing education, navigation, and vaccine access. Initial discussions were conducted with 23 stakeholders, and follow-up discussions were held with 16 stakeholders, including representatives of healthcare professionals, schools, local authorities, and community members.

Results: An intervention to be implemented in Slovakia focuses on the use of Roma health mediators who will provide parents and vaccine-eligible children (12-14 years old) from MRCs with information on HPV and HPV vaccination, invite them to educational sessions organized in community centres and at schools and navigate them through the vaccination process. The intervention also combines components such as videos and discussions with healthcare professionals, aligning with the needs and wishes of the target group.

Conclusions: This intervention will help to deliver reliable and understandable information on vaccination and enable people from MRCs to make informed decisions about vaccination. Roma health mediators will take the burden of providing information from overloaded healthcare providers and navigate community members through the vaccination process.

8.O. Oral presentations: Sexual and gender minority health

Skills and competences of sexuality educators. Evidences from a qualitative research in Italy

Marco Ubbiali

M Ubbiali[1], *L Mortari*[1], *G Paparatto*[2]
[1]University of Verona, Verona, Italy
[2]University of Pisa, Pisa, Pisa, Italy
Contact: marco.ubbiali@univr.it

Background: The scientific literature recognizes the strategic role of educators in sexuality education projects in schools. If, however, there is often a discussion about the most effective professional figure (teachers, school experts or external experts), there is a little attention to the skills and competences that an educator should possess and to which he or she must be trained. Adopting a Comprehensive Sexuality Education (CSE) approach, which is evaluated as the most effective, it is necessary to consider a skill set for educators that should not be limited to the knowledge in the area of sexual health promotion and risk prevention.

Methods: In order to build evidence-based competencies and skills, a qualitative study was conducted. A total of 72 educators involved in school-based CSE interventions in 4 Italian Regions, in 24 middle and secondary schools (68 classes), during 2 consecutive school years were enrolled. Before, during, and after the activities in the classrooms, qualitative feedback was collected, through reflective journals written by educators themselves. These data were analyzed through a qualitative approach, according to the principles of empirical phenomenology.

Results: The phenomenological evidences confirm the need to overcome the conception of educator as instructor equipped only with knowledge in the field of sexual health. It is considered fundamental to possess and develop pedagogical competences and skills, such as: caring attitude, teaching skills, theoretical awareness, capacity to manage the unexpected. Moreover, educators reported the necessity of an initial and continuous training on these dimensions considered as the most challenging.

Conclusions: The research confirms the complexity of the competency profile of CSE educators. Therefore, their professional development should include tailored designed multi-disciplinary training programs, with particular attention to the pedagogical dimension.

Key messages:

- Comprehensive sexuality education requires an adequate professional figure intended not as an instructor aimed only at risk prevention and health promotion, but as a real caring educator.
- Pedagogical skills and competences should be included in the training processes for sex educator, through adequate activities.

Abstract citation ID: ckae144.534
HIV-1 transmission clusters and drug resistance in men who have sex with men in Portugal

Ricardo Abrantes

R Abrantes[1], V Pimentel[1], M Miranda[1], S Cruz[1,2,3], SG Best-Hope[1], S Seabra[1], MRO Martins[1], P Gomes[4,5], M Pingarilho[1], AB Abecasis[1]

Contact: ricardo.m.abrantes@gmail.com

Introduction: In 2022, 45.8% of diagnoses in the EU/EEA with known route of transmission were in Men who have Sex with Men (MSM). We aim to characterise HIV transmission clusters and transmission of drug resistance (TDR), as well as its determinants, using integrated sociodemographic, behavioural, clinical, and viral genomic data of MSMs newly diagnosed in Portugal between 2014 and 2019.

Methods: This study included data from 340 MSM who were diagnosed with HIV-1 infection. These individuals were newly diagnosed at 17 hospitals in Portugal between September 2014 and December 2019. Phylogenies were constructed and transmission clusters were identified with branch support $\geq$ 90% and 1.5% genetic distance. Logistic regression models were computed to examine the factors associated with clusters of transmission and with the presence of TDR.

Results: We identified 38 transmission clusters with 104 MSM, which included 26.6% of the total 305 MSM from our database used for cluster analysis. The overall prevalence of TDR was 8.2%. Only subtype C was significantly associated with TDR. 10.5% of the clusters had at least 1 drug resistance mutation (K103N, L90M or N88S). There was no significant difference in the prevalence of TDR between MSM inside and outside clusters. 50% of the clusters were composed of portuguese native MSM only, whereas 16% had exclusively migrant MSMs. No significant difference was found in the proportion of portuguese and migrant MSM inside and outside clusters. Factors associated with HIV-1 transmission clusters were age at diagnosis, district of residence, unprotected anal or vaginal sex with a woman, HIV testing frequency, presenter status and subtype. 87% of men engaged in sexual activity only with other men, while 13% with both men and women.

Conclusions: Specific subgroups of MSM are contributing to HIV dissemination in Portugal. Direct and precise prevention measures based on molecular epidemiology should be developed.

Key messages:

- Specific subgroups of MSM are contributing to HIV dissemination in Portugal.
- Direct and precise prevention measures based on molecular epidemiology should be developed.

Exploring the mental health impact of asylum-seeking of sexual minority men: a qualitative study

Maria Gottvall

M Gottvall[1,2], R Isaac[1], T Carlsson[1,2]
[1]Department of Health Sciences, The Swedish Red Cross University, Huddinge, Sweden
[2]Department of Women's and Children's Health, Uppsala University, Uppsala, Sweden
Contact: maria.gottvall@rkh.se

Background: Sexual minority individuals, often called LGBTQ+, encounter significant danger and violence in some countries worldwide. This forces many to seek asylum in a range of European countries. The study aimed to explore the experiences of seeking asylum and its implications for the mental health of sexual minority forced migrant men in Sweden.

Methods: An exploratory qualitative approach was used, and 15 adult gay and bisexual cisgender men were interviewed individually. Participants were recruited through a combination of purposeful, convenience, and snowball sampling. Systematic text condensation was used to analyze data. The analysis was conducted in close collaboration with three migrants with lived experience.

Results: The asylum-seeking process proved emotionally challenging, involving procedures with negative impacts on mental health. Challenges included disclosing intimate information during asylum interviews and enduring long periods of uncertainty with limited information on asylum case progress. Fundamental to participants' experiences were the behaviors and attitudes of the professionals involved in legal procedures. Disrespectful and homophobic conduct during asylum interviews, enacted by interpreters and caseworkers, had been experienced by participants. The accuracy of interpretation emerged as crucial, possibly influencing the outcome of asylum claims as well as participants' comfort in sharing information.

Conclusions: Sexual minority men seeking asylum in Sweden find themselves in an unfamiliar and emotionally challenging position. The challenges highlighted in this study implicates that the stressful asylum process may lead to health burdens among this population. The study emphasizes the critical role of a safe, affirming and supportive environment for asylum seekers. Further research is needed to develop effective support methods to ensure the health and well-being of sexual minority forced migrant populations during the asylum process.

Key messages:

- The stressful asylum process may lead to health burdens among forced migrant sexual minority men.
- There is a need for public health action to develop effective support methods addressing the mental health challenges faced by sexual minority forced migrants during their asylum process.

Contact: guoqiang.zhang@ki.se

Background: Sexual fluidity is key to understanding the size of sexual minority populations and analyzing the socioeconomic disparities these populations face. This study explores the stability and changes in sexual identity over time, and identifies key demographic factors that predict shifts in sexual identity.

Methods: We analyzed longitudinal data from the Stockholm Public Health Cohort, following 36,398 participants from 2010 to 2021. Sexual identity was measured using a self-administered questionnaire in 2010, 2014, and 2021. Demographic data from 2010 were collected from the Swedish national registers. Multivariate Poisson regression with robust variance estimators was used to identify demographic factors that predicted identity changes. Results were presented as proportion or risk ratio (RR) with 95% confidence interval (CI).

Results: Overall, 12.1% (95% CI 11.8%-12.5%) changed sexual identity at least once in 2010-2021, including 10.4% (10.0%-10.7%) among those initially identifying as heterosexual in 2010, 41.3% (37.1%-45.6%) as homosexual, 59.6% (55.0%-64.0%) as bisexual, and 65.0% (59.4%-70.3%) as uncertain. Multivariate analyses showed that sexual minorities (homosexual: RR 5.00, 95% CI 4.45-5.61; bisexual: 6.68, 6.04-7.38; uncertain: 3.88, 3.30-4.55), females (1.28, 1.21-1.35), younger (18-29 years: 1.49, 1.30-1.70) and older (> =60 years: 2.07, 1.92-2.22) ages, born outside Sweden (Europe: 1.21, 1.11-1.32; Outside Europe: 2.90, 2.62-3.21), and lower education (< =9 years: 2.14, 1.98-2.31; 10-12 years: 1.43, 1.34-1.53) and income (100 SEK/year) (< =2,500: 1.83, 1.66-2.02; (2,500, 3,500]: 1.32, 1.19-1.46) independently predicted a higher probability of identity changes.

Conclusions: This study provides the first insights into sexual identity fluidity in a large general population sample in Sweden, highlighting its fluid nature. Future research is needed to unravel the intricate mechanisms underlying the demographic disparities in sexual identity fluidity.

Key messages:

- This study provides the first insights into sexual identity fluidity in Sweden, highlighting its fluid nature.
- Future research is needed to unravel the intricate mechanisms underlying the demographic disparities in sexual identity fluidity.

Defining child maltreatment for research and surveillance: a Delphi study in 34 countries

Lisa Hurt

L Hurt[1], LE Cowley[2], D Lamela[3], K Drabarek[4], LB Rodrigues[5], T Laajasalo[6], A Naughton[7], A Ntinapogias[8], U Nurmatov[1]

[7]National Safeguarding Team, Public Health Wales, Cardiff, UK
[8]Mental Health and Social Welfare Department, Institute of Child Health, Athens, Greece
Contact: hurtl@cardiff.ac.uk

Background: Child maltreatment is a complex public health issue that has consequences across the life-course. Studies to measure child maltreatment and identify interventions and services are constrained by a lack of uniform definitions across sectors and countries. We conducted a Delphi study to reach consensus on types and characteristics of child maltreatment for use in surveillance and research in Europe.

Methods: Statements were developed following a scoping review and identification of key concepts by an international expert team ($n = 19$). A multidisciplinary expert panel ($n = 70$) from 34 countries participated in three rounds of online data collection. We defined consensus as $\geq 70\%$ agreement or disagreement with each statement after the final round.

Results: Consensus was reached on 26/31 statements, with a participant retention rate of 94%. The definition states that child maltreatment is a subtype of violence against children. The perpetrator can be an adult or minor, but must be in a position of power over the child. To define an act or omission as child maltreatment, it must cause harm or have the potential to cause harm, regardless of intention, severity, chronicity, or the traditional/cultural beliefs of the perpetrator. In addition, the broad umbrella term encompassing emotional, behavioural or cognitive maltreatment should be "psychological", and psychological maltreatment should be split into sub-types of psychological abuse and psychological neglect. "Neglect" is a broad type of child maltreatment within which there are subtypes that can all be characterised as "failure to provide" or "failure to supervise".

Conclusions: This is the first study to demonstrate consensus on the types and key characteristics of child maltreatment across multiple sectors and countries, providing a unified definition of child maltreatment to improve consistency of measurement and surveillance in Europe. This abstract is submitted on behalf of Working Group 1 COST Action 19106.

Key messages:

- A standardised definition is essential for monitoring child maltreatment.
- We propose a consensus-based definition that can be used to improve child maltreatment measurement in research and surveillance.

8.P. Scientific session: Lessons-learned from recent foresight studies to support policy making?

Abstract citation ID: ckae144.538

Organised by: EUPHA-FS, RIVM (Netherlands), Instituto Superior Técnico (Portugal), RAND Europe
Chair persons: Henk Hilderink (EUPHA-FS), Ana Vieira (EUPHA-FS)
Contact: henk.hilderink@rivm.nl

Though foresight is still relative new regarding applications to public health, their number is rapidly growing. Recently, several foresight studies have been published with different health angles. These foresight studies have in general the purpose to support and improve the policy making process. Policy making that is foresight-informed, e.g. policies that account for possible futures and the uncertainty they encompass, will hopefully be better in achieving policy goals than without foresight. However, policy makers in general have a relatively short time horizon, may not welcome uncertainty and have many other aspects to account for when developing their policies. In this workshop, the link of foresight studies with policy making, also referred to as knowledge translation will be the focal point. The workshop will start with and interactive Mentimeter session to get a better view on how the audience is familiar with foresight and knowledge translation. Then, a brief presentation is given as introduction to foresight and a systematic way of doing knowledge translation, applied to foresight, explaining the basic concepts to level understanding of the audience. This is followed by three presentations of foresight studies on specific topics (Screening, AMR, Substance use) focussing on their link withing policy making. Next, two broader foresight studies will be presented (i.e. Dutch PHFS 2024 and the future of public health in Europe). These provide good examples on how broad future public health are analyzed and can be linked to public health policy making. The workshop will be concluded with a discussion with presenters on the lessons learned regarding foresight and the link to policy making.

Key messages:

- Foresight studies in the field of health are maturing by a stronger link to policy making.
- We can learn from recent foresight studies how to do better knowledge translation regarding foresight.

Abstract citation ID: ckae144.539

The future of screening and early detection in the Netherlands: a foresight study to support new screening policy strategies

Marit De Vries

M De Vries[1], *B Snijders*[1], *F Den Hertog*[1], *H Hilderink*[1], *L Dekker*[1]
[1]Public Health Foresight, RIVM, Bilthoven, Netherlands
Contact: marit.de.vries@rivm.nl

The Dutch government provides several population screening programmes intended for early detection of diseases so that prompt treatment can be provided. These include population screenings for various forms of cancer and screenings for specific diseases in unborn and newborn children. The future provision of these screenings is influenced by various developments, including the ageing population, economic fluctuations and technological advancements. To understand these developments and their potential impacts on the future of screening and early detection, RIVM has conducted a foresight study based upon a systematic six-step approach. Important steps in this process are building a conceptual framework, identifying important developments via horizon scanning, selecting scenario logics and making scenarios in order to select important challenges and opportunities for the future. The final output of the foresight study consists of a broad horizon scan, two simple future scenarios and four societal perspectives on screening and early detection. In this foresight study, there was special attention for the role of different societal perspectives and the variation in desirable futures that these perspectives entail. These perspectives were presented to the Ministry and other important stakeholders in the future strategy planning, by playing a serious role game. The results of the foresight study and the experience of looking to the future through various perspectives forms the input for the Dutch Ministry of Health, Welfare and Sport in formulating a strategy for the future of screening and early detection and making informed decisions about potential actions. The presentation will focus on how the foresight process was done and how this has informed the Ministry of Health in order for them to follow the next steps in setting future goals and ambitions and planning for a future policy strategy.

Abstract citation ID: ckae144.540

Applying foresight methods at the national level in the field of substance use: Experience from the DRUG-PREP project

Shona Cosgrove

S Cosgrove[1], *B Hauspie*[1]
[1]Sciensano, Brussels, Belgium
Contact: Shona.Cosgrove@sciensano.be

This presentation will focus on the experience from the DRUG-PREP project. While foresight has been used in other sectors, its implementation in the drugs field has previously remained relatively limited. The application of foresight to the drugs sphere is important in recognition of the fast-changing and intersectional nature of drugs and addiction. At the European level, a futures exercise was organized by the EMCDDA (as of July 2024 the European Union Drugs Agency, EUDA) to explore the future of drugs at the European level until 2030. In this landscape, the DRUG-PREP project implemented foresight approaches at the national level, to support preparedness of national drug monitoring and response systems. The DRUG-PREP partners carried out individual national exercises in six countries: Belgium, Czechia, Finland, Ireland, the Netherlands, and Portugal. The link to policy was a key aspect of the project, with each country organising a national dialogue to directly engage policymakers. The presentation will focus on the Belgian research. Horizon Scanning was performed to identify trends and megatrends with potential implications on the national drugs ecosystem, through a literature review. An expert workshop was organized to validate the trends and explore their implications. Subsequently, a small scenario building exercise was organised to explore the consequences of a clearly defined 'disruptor': the ban on opium production in Afghanistan. Finally, a national dialogue allowed discussion with stakeholders on how foresight can be integrated more structurally in the drugs field in Belgium. A summary of the results will be presented. Policymakers across all levels (local, regional, federal) have been active participants in the foresight activities and workshops. The link to policymaking has been crystallized in the integration of foresight into the new Belgian National Drugs Strategy 2024-2025.

Abstract citation ID: ckae144.541
Future-Proofing Analysis of the 2017 EU AMR Action Plan

Sarah Parkinson

S Parkinson[1]
[1]Health and Wellbeing Group, RAND Europe, Cambridge, UK
Contact: sparkins@randeurope.org

Antimicrobial resistance (AMR) is a serious public health concern and has been deemed a top priority amongst public health authorities internationally. AMR is a complex issue, which is affected by a wide range of diverse factors including antimicrobial use, vaccines, surveillance, climate change and global conflicts. In thinking about how to address AMR, it is important to not only consider how multiple factors interact to contribute to the issue, but also how these factors may develop in the future. In 2017, the European Commission published the European One Health Action Plan against AMR, which set out objectives and priory areas for actions across EU/EEA Member States. This presentation will discuss the results of a future proofing study of this Plan. The study included a series of scenarios for how AMR might develop over the next ten years, in order to gather stakeholder perspectives on how the Plan can be improved to mitigate against future risks, take advantage of future opportunities and move towards more favorable futures. In particular, this presentation will focus on how this futures method was used to arrive at specific and actionable recommendations about how to better prepare for the future of AMR.

Abstract citation ID: ckae144.542
Public Health Challenges for 2050 in the Netherlands

Lea Den Broeder

L Den Broeder[1]*, C Couwenbergh*[1]*, L Dekker*[1]*, H Hilderink*[1]*, T Janssen-van Eijndt*[1]*, A Spijkerman*[1]*, B Staatsen*[1]*, K Van Zoonen*[1]
[1]Public Health Foresight, RIVM, Bilthoven, Netherlands
Contact: lea.den.broeder@rivm.nl

Every 4 years, the National Institute for Public Health and the Environment (RIVM) carries out the Dutch Public Health Foresight Study, commissioned by the Ministry of Health. The ninth edition (PHFS-2024) compiles an outlook on future public health and the health care system in the Netherlands. It combines a business-as-usual Trend Scenario with literature study and a range of qualitative and mixed-methods approaches. The Trend Scenario comprises projections up to 2050 for a broad range of epidemiological indicators. Such as (healthy) life expectancy, disease burden, life style factors. The qualitative and mixed methods approaches supported an incremental intersubjective process. Methods were a focus groups study, stakeholder sessions and workshops. An important innovation in this study was the Citizen Council and Panel. The outcomes show that demographic development, in particular growth of the group people at high age with multimorbidity, will lead to high pressure on the formal and informal health care system but also on e.g. mental health. A life course approach applied shows that decreasing mental health of youth will have long term consequences. Also, overweight will deeply impact older people's health in the future. Lastly, climate change in combination with e.g. energy transition will deeply affect our society and living environment. Next to these challenges, there will also be opportunities to improve health. Building a climate-proof living environment that also stimulates healthy life styles and social interaction is one of them. However, improving health has linkages with policy areas outside the traditional public health domain as well and requires, firstly, a Health in/for All Policies approach. Secondly a whole-of-society approach in which companies and civil organizations take action is needed. All these efforts can only be effective if people and communities are put at the core of all health policies.

Abstract citation ID: ckae144.543
The future of public health in Europe

Caroline Costongs

C Costongs[1]*, A Wagenführ-Leroyer*[1]*, B Eliasen*[2]*, P Gallen*[2]*, J Jerez Pombo*[2]
[1]EuroHealthNet, Brussels, Belgium
[2]Copenhagen Institute for Futures Studies, Copenhagen, Denmark
Contact: c.costongs@eurohealthnet.eu

EuroHealthNet - in collaboration with the Copenhagen Institute for Futures Studies - has conducted a Foresight study to collect insights and identify risks and opportunities. The study investigates the role of public health by 2035 in achieving health equity through health promotion and prevention, in the context of the digital and green transition. The multi-round study ran from June to November 2023. It consisted of a workshop, a kick-off meeting, two rounds of surveys using the Delphi method, and a final back-casting expert panel. The Foresight exercise involved 35 experts across Europe and covered six themes: public health policy and governance; public health financing and spending; sustainability and the green transition; health promotion and disease prevention; equity and society; digitalisation in public health. The presentation will highlight some of the outcomes, recommendations as well as experiences from this Foresight exercise and how it can be applied in practice.

8.Q. Skills building seminar: "The Church of Fail": Learning from Our Mistakes in Co-Creation

Abstract citation ID: ckae144.544

Organised by: Aarhus University (Denmark), Glasgow Caledonian University (UK), VIA University College (Denmark), Health Cascade
Chair persons: Knud Ryom (Denmark), Danielle Agnello (UK)
Contact: knudryom@ph.au.dk

When delving into the co-creation research literature, it might seem that researchers consistently attain success in their projects without any exceptions. At the extremes, co-creation might even be portrayed as a quasi-moral scientific approach, where the results are inherently positive and beneficial to all participants. Rarely do researchers openly discuss failures or mistakes encountered during co-creation projects, despite the well-established understanding that co-creation presents significant challenges and demands for those involved. Therefore, we aim to use the well-established "Church of Fail" method to underscore the importance of learning from failures, particularly within the dynamic and demanding landscape of co-creation. Therefore, we invite participants to embrace the inevitability of failures, emphasizing that the key lies in deriving valuable lessons from these. Failures present the greatest potential for professional growth and innovation. Reasons for the workshop: Ensuring the professional growth of researchers and practitioners is vital to unlocking the full potential of co-creation and participatory methodologies. It may appear that success in co-creation is guaranteed by applying principles such as building ownership or fostering shared understanding. However, in reality, co-creation demands significant effort, resources, and dedication from everyone involved. One way to avoid mistakes or failures is to embrace them and learn from them, thereby fostering professional growth and innovation.

Objectives: This workshop will: 1) Increase awareness of co-creation as a methodology within public health, by generating an open and safe learning environment for professional growth; 2) Exchange experiences with failure, to learn and encourage professional growth. The presenters will engage the participants with cases that illustrate different known pitfalls within co-creation, such as power imbalance, participation fatigue, recruitment strategies, and aligning objectives; 3) Discuss important consideration on co-creation approaches, to achieve the best possibility for success in such research projects in public health in the future.

Key messages:

- Failure is not a flaw, but an opportunity to learn and innovate.
- Success in co-creation is not a given, even though it sometimes seems so when reading the literature.

Abstract citation ID: ckae144.545
"The Church of Fail": Learning from Our Mistakes in Co-Creation (part I)

Danielle Agnello

D Agnello[3], K Ryom[1], JS Jacobsen[2], MG Laursen[1], L McCaffrey[3], M Vogelsang[3], S Chastin[3]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark

[3]School of Health and Life Sciences, Glasgow Caledonian University, Glasgow, UK
Contact: danielle.agnello@gcu.ac.dk

Our workshop commences with a short presentation about what co-creation is, and the power that lies in learning from failures. Then, the facilitator will open the sharing session with the aim to set a safe space by presenting some ground rules for engagement. Then, the participants will be invited to step forward and share their story of failure. Each participant is invited to introduce themselves, and answer three simple questions: What did you fail at? How did you cope with it? What would you do differently? When the participant finishes their story, the facilitator will thank them and the audience will applaud them for sharing. This part of the workshop will go as long as there are people who want to share (with limitations).

"The Church of Fail": Learning from Our Mistakes in Co-Creation (part II)

Knud Ryom

K Ryom[1], D Agnello[3], JS Jacobsen[2], MG Laursen[1], L McCaffrey[3], M Vogelsang[3], S Chastin[3]
[1]Deaprtment of Public Health, Aarhus University, Aarhus, Denmark
[2]Health and Welfare Technology, VIA, Aarhus, Denmark
[3]School of Health and Life Sciences, Glasgow Caledonian University, Glasgow, UK
Contact: knudryom@ph.au.dk

For the second activity, participants will be invited to break into smaller facilitated groups for a 'peer-to-peer' session where they will share further and discuss lessons learned and how they would do things differently going forward. They will do this by either working with one of their own failure stories/cases, or a predetermined case around critical aspects of co-creation, such as power imbalance or recruitment strategies. The groups will work with a facilitator and a template to discuss some key aspects of learning, such as what do you perceive as the failure, how could you address this, and the changes they could be made moving forward. The second session closes with each group nominating a presenter to share their reflections on the proposed solutions in plenary. The facilitator will close the workshop by inviting participants to sign up to join a collaborative effort to publish examples of failures and lessons learned when addressing complex public health challenges. This has the potential to increase awareness about the importance of embracing the power of failure, and break down the stigma that comes with admitting to your mistakes.

Speakers/Panelists:
Sebastien Chastin
Glasgow Caledonian University, Glasgow, UK

9.A. Pitch presentations: Transforming public health

Abstract citation ID: ckae144.547
Integrating AI in cause-of-death regular statistical production with human and expert system codings

Elisa Zambetta

E Zambetta[1], N Razakamanana[1], A Robert[1], D Martin[1], E Coudin[1]
[1]CépiDc, INSERM, Paris, France
Contact: elisa.zambetta@inserm.fr

Background: Cause-of-death (CoD) statistics are key indicators in epidemiology and public health. These statistics are derived from death certificates completed by physicians and are usually coded by official statistics authorities according to the standards of the WHO ICD-10 classification to construct time- and cross-country-comparable statistics. For coding causes of death in free-text format in France according to ICD-10, predictions by deep neural networks (DNNs) are employed in addition to fully automatic batch coding by a rule-based expert system and to interactive coding by the coding team.

Methods: Seq-to-seq DNNs are trained from scratch on previously coded data to ICD-10 code multiple causes and underlying causes of death. Human coding is focused on certificates with a special public health interest or with low confidence in AI prediction quality to maximize the quality of the overall statistics disseminated when human resources are limited. DNNs also directly predict multiple causes and underlying causes of death for part of the certificates. Hence, the coding campaign aims to optimally allocate a coding mode to a given certificate.

Results: For deaths in 2021, 63% of the certificates are automatically batch coded by the expert system, 14% by the coding team, and 23% by DNNs. Compared to a traditional campaign that would have relied on automatic batch coding and manual coding, the present campaign reaches an accuracy of 95.7% for ICD-10 coding of the underlying cause (97.3% at the European shortlist level).

Conclusions: The 3-coding mode approach enables timeliness of dissemination of CoD statistics and may lead in the future to more responsive surveillance.

Key messages:

- Deep neural networks trained on already coded data can be integrated into the regular statistical production of the CoD database in a fully controlled way.
- The allocation between the different modes of coding can be optimized to achieve best quality and timeliness under the constraint of limited human resources.

Abstract citation ID: ckae144.548
Transforming systems and improving lives - the social movement of compassion in Wales

Joanne Hopkins

J Hopkins[1,2,3], N Blakeborough[3], J Bromwell[3], L Hopkins[3], B Roane[3], T Brierley Sollis[2], C Hughes[2]
[1]Policy and International Health, Public Health Wales, Cardiff, UK
[2]Faculty of Social and Life Sciences, Wrexham University, Wrexham, UK
[3]ACE Hub Wales, Public Health Wales, Cardiff, UK
Contact: joanne.hopkins2@wales.nhs.uk

Wales has embarked on a journey towards becoming an adverse childhood experiences (ACEs) and trauma-informed nation. In 2021 the Welsh government supported the co-creation and co-production of an all age, all of society framework: Trauma- Informed Wales: A Societal Approach to Understanding, Preventing and Supporting the Impacts of Trauma and Adversity (ACE Hub Wales et al 2021). This framework is not just an operating model, it has the ambition to be a social movement to embed and sustain a culture shift that is rooted in tackling the conditions of inequality in our communities and the work we do in organisations in the clinical and community settings that support, and employ, people who have experienced trauma and adversity in their lives. The starting point is that any of us can have these experiences. The trauma and ace informed toolkit sets out a process of readiness, self assessment, action planning and implementation across six domain areas which include governance and leadership, monitoring and evaluation, policy and practice. Resources and guidance are co-created and co-produced by partners already on the journey, developed and tested in environments to look at trauma-informed physical spaces, communications, workforce development, training and inclusion of marginalised voices. Supporting this work is a national community of practice, promoting good practice, sharing ideas and developing a culture of wisdom supported by reflective practice. This dynamic forum is supported by online and in person capacity and is transforming organisations and sectors including housing, education, substance misuse, criminal justice and health. It places people, compassion, kindness and empathy at the heart and is enabling traumatised systems to understand and meet the needs of the workforce and the people they serve.

Key messages:

- Systems change is sustained by compassion, kindness and love in a social movement supported by the scaffolding of an operating model.
- Public Health has a key role to play in co-developing social networks and resources to transform traumatised systems into trauma-informed places that improve lives and health outcomes.

Abstract citation ID: ckae144.549
Effects of metaphorical communication on vaccine confidence in the adolescent population

Fabiana Nuccetelli

F Nuccetelli[1], V Gabellone[1], E Gabrielli[2], PL Lopalco[1]
[1]Experimental Medicine, University of Salento, Lecce, Italy
[2]Department of Prevention, Lecce Local Health Unit, Lecce, Italy
Contact: fabiana.nuccetelli@unisalento.it

Vaccine hesitancy, defined as delay or refusal of vaccination despite the availability of vaccination services, has been included by WHO among the top 10 global health threats. Individual decision-making process can be strongly affected by communication. The use of metaphors is common in public health communication and increased during the COVID19 pandemic. Although some evidence has supported the persuasive potential of metaphorical language over scientific language, further research is needed. Our study aimed at comparing the effects of neutral scientific talk with war and protective metaphors on health communication. An online survey was conducted on a convenience sample of Italian teenagers randomly allocated to three study arms. Each participant was invited to watch a specific version of an informative video on infections and vaccines (group 1: neutral-scientific approach, group 2: metaphorical-war, and group 3: metaphorical-protective approach). After watching the video, each participant responded to an ad-hoc questionnaire. A total of 2681 subjects were randomly allocated to the three groups. No significant differences regarding age, sex and geographical area were detected between groups. Median age of the sample was 17 years (mean 16,8) and 56.8% were girls. The general attitude towards vaccination in group 2 and 3 was largely positive, with the majority agreeing (strongly or tend to agree) on the fact that vaccination is important (group 2: 89%; group 3: 92%), safe (group 2: 91%; group 3: 92,5%), effective (group 2: 85%; group 3: 88%), and does not generate anxiety (group 2: 80%; group 3: 83%). Higher level of distrust against vaccines was found in group 1, where 32% of participating adolescents are strongly or tend to be anxious about getting vaccinated. The results of our survey suggest that emotional involvement evoked through the use of metaphorical language may have, at least in the short run, some positive effect on vaccine confidence.

Key messages:

- Use of metaphors can be successfully used in public health communication.
- Messages evoking either war or protecting concepts are more efficacious than plain scientific language.

Abstract citation ID: ckae144.550
Artificial intelligence – NPHIs' role in utilizing its opportunities and addressing the risks

Claudia Habl

C Habl[1,3], T Ottersen[2,3]
[1]International Policy, Evaluation, Digitalisation, Austrian National Public Health Institute, Vienna, Austria
[2]Infection Control, Norwegian Institute of Public Health, Oslo, Norway
[3]Regional Network Europe, International Association of National Public Health Institutes, Paris, France
Contact: claudia.habl@goeg.at

Issue & Problem: National Public Health Institutes (NPHIs) in many countries are at the forefront of action to mitigate the impact of current and future threats to health as well as improving population health and wellbeing. Through research, collaboration, and support, NPHIs can approach these new realities together. One of the many emerging realities that NPHIs will need to engage in is how NPHIs best can utilise the powers of artificial intelligence and deal with the ethical and legal issues that come with it.

Methods: In preparation of IANPHI's (International Association of National Public Health Institutes) Europe Regional network meeting in April 2024 a survey was conducted among the 42 members. 16 countries replied to questions, around e.g., 1) current applications of (generative) artificial intelligence (AI) in the work of institutes, 2) which experiences were made and 3) which measures NPHIs take to best utilize the possibilities and overcome challenges of AI technologies. Within four weeks 16 replies were shared.

Lessons & Conclusions: Some institutes have not yet adopted AI, while others report multiple applications but the primary areas of application vary considerably among Europe.

Applications include: summarizing and reformatting text; translation; transcribing and documenting meetings; search information in documents or databases; coding; creating visuals; literature review; surveillance of infectious diseases; disease forecasting; analysis of transmission dynamics; vaccine efficacy assessment and development; image recognition; diagnosis and prediction of diseases from medical datasets; text mining; symptom extraction; social listening; prediction of nitrate concentration in groundwater; drug analysis and measuring psychological resilience in social crisis.

Key messages:

- AI poses opportunities and risks for public health and work of national public health institutes and capacity building initiatives are essential.
- IANPHI decided to develop a joint framework for the use of AI in its member organisations with a focus on research and responsible use.

An automated approach to health misinformation monitoring on YouTube

Irfhana Zakir Hussain

I Zakir Hussain[1], *N Kaur*[1], *A Oetomo*[1], *L Chen*[1], *PP Morita*[1], *T Hanjahanja-Phiri*[1], *J Kaur*[1]
[1]School of Public Health Sciences, University of Waterloo, Waterloo, Canada
Contact: irfhana.zakirhussain@uwaterloo.ca

Background: YouTube is a social media platform associated with large viewership but little research into its role in the propagation of online health misinformation. This study proposes an automated pipeline to facilitate the collection and analysis of health misinformation on YouTube.

Methods: The pipeline relies on Python and the Youtube Data API. A preliminary test of the proposed pipeline was conducted using two videos from the channel "@BobbyParrish" (5.55M subscribers, 1.5K videos). The pipeline was used to extract two videos with large view counts and comparable like and comment counts. This extraction includes the transcript of the respective videos and engagement metrics. All the comment threads under the videos are also collected with the reply structure preserved. Then, the pipeline employs NLTK's SentimentIntensityAnalyzer to score each comment for sentiment polarity and classify into positive, negative, or neutral. The pipeline generates visualizations of the sentiment distribution and a frequency-based word cloud of emojis extracted from the text.

Results: The proposed pipeline passed the test satisfactorily. It was able to retrieve channel statistics and metrics associated with the videos on the channel. It also successfully extracted the transcript and complete comments of the videos while preserving the integrity of the reply structure found on YouTube. Automated analyses of the data resulted in comprehensive and accessible visualizations.

Conclusions: The proposed work has the potential to facilitate large-scale studies into the propagation of health misinformation on YouTube. Moreover, it can be used by public health officials to rapidly address viral videos spreading health misinformation through social inoculation. Future work includes integrating topic modelling and automatic classification of health misinformation in the analysis portion of the pipeline.

Key messages:

- The pipeline offers public health officials and researchers a rapid tool to identify and analyze health misinformation on YouTube, facilitating timely interventions.
- The pipeline enhances the ability to monitor and respond to evolving public health misinformation trends, by automating the extraction and sentiment analysis of YouTube data.

9.B. Scientific session: Promoting health in the digital age: a room to improve health literacy and digital health literacy?

Abstract citation ID: ckae144.552

Organised by: EUPHA-DH, -HL, -HP, University of Pavia (Italy), WHO Collaborating Centre for Health Literacy, Technical University of Munich (Germany)
Chair persons: Anna Odone (EUPHA-DH -IDC), Eric Breton (France)
Contact: vincenza.gianfredi@unimi.it

The workshop aims to explore innovative approaches to promoting health literacy and digital health literacy and their impact on individual and community health outcomes at different stages of life. This initiative is driven by the recognition that digital platforms and tools offer unprecedented opportunities to improve population health through health education and behavior change. The workshop will feature a dynamic and interactive format starting from plenary sessions in which speakers will provide insights into digital health promotion best practices and their outcomes, offering diverse perspectives. The added value of organizing this workshop lies in its comprehensive approach to integrating digital tools into health prevention strategies, particularly for addressing childhood smoking. By examining innovative digital interventions, the workshop provides a platform for sharing insights and strategies that leverage technology to promote healthier lifestyles among youth. This is increasingly pertinent as digital platforms become central in the daily interactions of young people. The coherence between the presentations revolves around the theme of enhancing digital health literacy as a preventive measure against health issues. The first presentation sets the stage by exploring digital tools that educate and engage young people about the dangers of smoking. The subsequent session builds on this by assessing the current state of digital health education and literacy, emphasizing the need for curriculum integration and better training for educators to support these initiatives effectively. Finally, the meta-analysis presentation ties everything together by evaluating the effectiveness of these digital interventions across various demographics, offering evidence-based recommendations for tailoring health literacy programs to diverse needs. Together, these presentations form a cohesive narrative on the critical role of digital literacy in health prevention, illustrating a clear pathway from educational content to educational infrastructure, and culminating in broad-based intervention strategies that can be adapted to different settings and populations. This coherence enhances the workshop's impact, providing attendees with a well-rounded understanding of how digital tools can be harnessed to foster long-term health improvements from an early age. Live Q&A sessions will encourage dialogue between speakers and attendees, enhancing the learning experience. By combining expert knowledge with interactive discussions, the workshop aims to share insights needed to implement effective digital health promotion strategies.

Key messages:

- The role of health literacy and digital health literacy in improving health outcomes demands that the efficacy of the most effective strategies be evaluated.
- Digital tools offer opportunities for innovative health promotion approaches and tools.

Abstract citation ID: ckae144.553
Digital interventions to prevent smoking habit among children. Is there evidence?

Vincenza Gianfredi

Smoking remains one of the foremost preventable causes of death and disease on a global scale, with its roots often traced back to early childhood. The habit typically begins at a young age, setting a pattern that becomes increasingly difficult to break over time. This enduring issue highlights the critical need for effective preventive measures. Traditional approaches to curbing smoking among the youth-such as public health campaigns, school-based education, and legislative measures like age restrictions on tobacco purchases-have had limited success. In this context, digital interventions (DIs) have begun to emerge as a promising new frontier for tobacco prevention. Leveraging the pervasive influence of technology in young people's lives, these interventions include gamified educational programs, which transform learning about the dangers of smoking into interactive and engaging activities; social media campaigns, which can spread powerful anti-smoking messages quickly and broadly; and virtual reality experiences, which immerse users in scenarios that vividly illustrate the impact of smoking on health. These digital strategies not only offer fresh avenues for conveying important health information but also engage young audiences in a medium they find relatable and compelling. In this context, the presentation will discuss results of a systematic review aims to assess the efficacy of DI in preventing smoking, and improving knowledge and awareness about smoking damages, among children. This review is part of the PRIN project, titled: "Leo&Giulia standing for public health", whose goal is to evaluate the effectiveness of a DI aimed at school-aged children, intended to increase knowledge about the negative effects of smoking and prevent its use. Grasping the impact of DI in smoking prevention can greatly benefit public health by offering practical alternatives.

Contact: orkan.okan@tum.de

With the introduction of the Digital Competence Framework (DigComp+) by the European Commission, European schools have committed to promoting digital and media literacy systematically. DigComp+ shares several intersections with health literacy, e.g., information management, using digital tools, and taking action on the digital and commercial determinants of health, making it an ideal curriculum to teach digital health literacy in schools. However, internationally, not much is known about digital health literacy in schools. The aim of this study is to present data from a representative school study of students and teachers in 16 federal states in Germany. Data was collected using an online survey from a representative sample of N = 1,448 students (9-18 years) and a convenient sample of N = 1,600 teachers. With SPSS, descriptive statistics, chi-square tests, and internal consistency were calculated. Cronbach's alpha indicated good internal consistency for both tools. Low digital health literacy was reported by 52,9 of students and ~39,3% of teachers. In students, low digital health literacy linked with younger age (X2 (2)=34.69, p = <.001), family affluence (X2 (4)=24.16, p = <.001), and parental education (X2 (2)=8.26, p=.016). In teachers, it was linked to age ($p < .048$), school position ($p < .001$), and their own digital health literacy DHL ($p < .001$). More than 45% of teachers reported not teaching digital health literacy in schools, while on average, 55% of students indicated they would not learn it in schools. Based on the first digital health literacy in schools study, results suggest DigComp+ is almost not used to teach digital health literacy and both students and teachers have significant deficits in their digital health literacy. Teachers should be trained in digital health literacy so that they can include it in their classroom teachings to promote the digital health literacy of students.

The rapid evolution of digital health emphasises the need for effective eHealth literacy (eHL) to ensure equitable access to health information and improve patient outcomes. This systematic review and meta-analysis aim to assess the effectiveness of eHL interventions, addressing the significant gap in knowledge about which strategies are most beneficial. Adhering to PRISMA guidelines, we systematically retrieved, quantitatively pooled and critically appraised available experimental evidence on the effectiveness of eHL interventions across different populations. PubMed, Scopus, Web of Science, Embase, Cochrane Library, and ClinicalTrials.gov were searched for studies reporting original quantitative outcomes of eHL, assessed by the eHealth Literacy Scale or other validated scales. Data were pooled using a random-effects model, with critical appraisal of the included studies. From the 504 records screened, 15 studies met the inclusion criteria. They encompass interventions targeting adults with chronic diseases (6 studies), older adults (5), and young people (4) and examine either individualistic or collaborative approaches (respectively, 9 and 5 studies, and 1 assessing both). The meta-analysis revealed significant improvements in eHL, both pre- vs post-intervention (UMD

5.81, 95%CI 3.38-8.26, N = 1,025) and experimental vs control groups (OR 3.65, 95%CI 2.06-6.46, N = 1,258). Meta-regression showed a significant correlation between pre/post-intervention outcomes and baseline eHL levels (slope=-0.91, p-value=0.009). Our findings support the effectiveness of tailored interventions in significantly enhancing eHL, providing key insights (role of baseline eHL levels and intervention approach) for intervention design and implementation that are adaptable to various demographic contexts. This research was supported by the National Plan for Complementary Investments to the NRRP Hub Life Science-Digital Health (PNC-E3-2022-23683267, DHEAL-COM).

9.C. Round table: The Global Oral Health Action Plan – Integrating Oral Health into the global health agenda

Abstract citation ID: ckae144.556

Organised by: EUPHA-OH, -GH

Chair persons: Pauline Vassallo (Malta), Elena Petelos (EUPHA-HTA, EUPHA-GH)

Contact: Pauline.j.vassallo@gov.mt

Oral diseases (OD) are a global public health problem affecting 3.5 billion people, with a global prevalence of 45%, higher than the prevalence of any other non-communicable disease (NCD). Recognizing the global public health importance, the 76th World Health Assembly (WHA) (May 2023) adopted the WHO's Global Oral Health Action Plan (GOHAP) 2023-2030; a crucial step to bring momentum and mobilise all actors to address the burden of OD and common risk factors for all NCDs, while integrating oral health (OH) as part of general health and promoting cross-sectoral cooperation on good OH worldwide to reach UHC. Drawing insights from other successful global health action plans, this roundtable (RT) will explore key lessons learned in implementing effective strategies to improve OH outcomes at European and global levels, ensuring access to quality care for all.

The objectives of the RT are: 1.To present the GOHAP 2023-2030, incl. challenges and opportunities; 2. To draw insights from other global health action plans; 3. To present good examples of civil society organization (CSO) actions supporting the GOHAP's implementation - The Manifesto of the Platform for Better Oral Health, calling for policy actions by EU policymakers; 4. To present findings from the EU DELIVER (DELiberative ImproVEment of oRal care quality) and PRUDENT projects, funded by the European Commission, aiming to provide and implement a blueprint model for ensuring access to quality OH care for all; 5. To inform follow-up actions and collaboration across EUPHA sections, its strategy, as well as that of European Member States (MS), CSOs and other institutional partners, and to raise awareness across the European public and global health communities.

The structure of the RT will include brief interactive presentations with real-time polling to maximize participant engagement and to consolidate key messages to present at the end of the session, incl. to inform follow-up actions across EUPHA. The first brief presentation on GOHAP will highlight the aims and evidence-informed actions, followed by: 1. Insights from other global health action plans, exploring lessons learned in implementing effective strategies, examining the approaches, opportunities, challenges and outcomes; 2. Good examples of actions taken by CSOs; 3. Preliminary findings from the EU DELIVER and EU PRUDENT will be presented, incl. key co-creation tools of deliberative dialogues and the development of a set of quality indicators for applicability on the practice, community and policy levels.

Guided discussion will focus on opportunities and challenges in GOHAP implementation, with the targeted questions to panellists on: What can countries learn from other global health action plans? What should be the priorities of EU MS? What is the role the public health community can play? What are key steps needed to eliminate common NCD risk factors to drastically reduce the prevalence and burden of ODs?

Key messages:

- There is an urgent need in the global and public health communities to better understand the processes involved in implementing the GOHAP, incl. challenges and opportunities.
- Interdisciplinary and cross-sectoral collaboration is key to address the common risk factors of NCDs, to inform concerted action and evidence-informed policymaking to improve oral health care.

9.D. Practice session: Luton, a Marmot town – Lessons from using a whole-system approach to tackle health equity

Abstract citation ID: ckae144.557

Organised by: Luton Borough Council (UK)

Chair persons: Laura Austin-Croft (UK), Jessica Allen (UK)

Contact: sally.cartwright@luton.gov.uk

Objective: To share learnings from our Health Equity Town journey, including opportunities and challenges. To allow stimulating discussion on whole system approaches to health inequalities and the social determinants of health. To include discussion on where and how public health influences or leads, the importance of impact measures, and of shared vision.

Added value: Luton's 2040 strategy, and being a health equity town, are long term visions. It has been 18 months since we launched Luton's health equity ambition, and during that time we have taken great strides forward in how we deliver against the Marmot principles and create a movement around health equity in Luton. Organisations nationally and internationally are grappling with approaches to doing this. This workshop will provide an opportunity to discuss some of the key learnings, challenges and opportunities so far in taking this approach, and how to continue to maintain momentum and buy in across sectors at local level.

The workshop will include discussion on the following: 1. Taking a whole-system approach to health inequalities - working across system leaders and strategic partners including health, care, voluntary sector, businesses, housing, police and others, as well as across the local authority departments. This takes clear articulation of the problem and actions, as well as clarity on where public health professionals are most effective to support, influence, and lead. 2. There is increasing recognition of the building blocks of health and the importance of ensuring action to improve health outcomes is taken across the whole system to tackle health inequalities - including employment, education, and housing. Discussion on specific actions being taken in some of these areas to tackle health inequalities as part of the health equity town approach. 3. Working with the community to understand health inequalities. 4. How we will measure progress. 5. The concept of proportionate universalism is now well known, however making this a reality is a challenge. 6. East London Foundation Trust, the mental health provider in Luton, is also embedding Marmot Policy objectives across the Trust, and is a key partner in Luton. Work is underway to establish projects with joint aims such as skills passport to increase employment in mental health service users.

Format: Presentation followed by opportunity for question and answer and discussion with panel.

Key messages:

- Whole system approaches to tackling health equity are possible through shared vision and coordinated approach.
- Action across the building blocks of health is vital, the complex and long term nature is challenging.

Abstract citation ID: ckae144.558
Luton, a Marmot town – using a whole-system approach to tackle health equity

Sally Cartwright

Issue: Luton has high deprivation and health inequalities. We have a borough-wide vision that no one should live in poverty by 2040, and have become a health equity town - committed to Marmot policy objectives and recommendations across all we do.

Description: Luton is 70th most deprived local authority in England, with stark health inequalities. To deliver the 2040 ambition, 5 pillars have been established, including tackling health inequalities. Luton has become the first Marmot Town in the UK, working with the Institute of Health Equity to develop recommendations and actions relating to the Marmot Policy objectives. Cross-sector system partnership has been key -NHS, businesses, housing, voluntary sector, university. Year 1: we mapped the Marmot recommendations to existing workstreams; completed a mixed-methods evaluation to understand system views of the approach and establish our impact measures. We established steering groups: Children and young people; Housing; Employment and skills; Net zero, they continue to embed recommendations using logic models. We have an overarching strategic approach, alongside smaller scale programmes, to create a movement. Including: grant funding; regular newsletter; training; case studies repository and annual celebration event.

Results: We have established 15 impact measures across Marmot policy areas to review annually. Qualitative evaluation findings built into work plans include: improved governance and accountability; workforce development across the system; use of logic models; Learning from best practice; sharing knowledge and learning.

Lessons: The wider agenda of Luton 2040 has enabled health inequalities to be embedded into strategic discussions; improved evidence base and clear narrative to support priorities is helpful; clear focused recommendations helps move work forwards; shared understanding of how we will measure long term impact is vital, communicating to the system is key, and long-term ism challenging.

Assessing Health Gains: A Cost-Utility Analysis

Giovanni Guarducci

G Guarducci[1], *C Siragusa*[2], *J Gurnari*[3], *AM Gentile*[3], *N Nante*[1,4]
[1]Post Graduate School of Public Health, University of Siena, Siena, Italy
[2]Department of Medicine, Surgery and Neuroscience, University of Siena, Siena, Italy
[3]San Michele Private Hospital, Albenga (SV), Italy
[4]Department of Molecular and Developmental Medicine, University of Siena, Siena, Italy
Contact: giovanni.guarducc@student.unisi.it

Background: With the increase in life expectancy and the consequent shift in the epidemiology of chronic diseases, the need to enhance and measure the population's health status is even more imperative. The aim of this study is to assess health gains and their associated costs provided by an Italian clinic.

Methods: A retrospective study was conducted on 129 patients admitted for short-term planned hospitalization from June 2020 to August 2023. At both admission and discharge, these patients completed the EQ-5D-5L questionnaire. Quality-Adjusted Life Years (QALYs) were calculated from the difference in EQ-5D-5L scores between discharge and admission, assuming that health gains (discounted at a rate of 3.5%) accumulate up to two years after discharge. Cost-utility analysis was performed using QALYs and invoices issued by the clinic (cost of hospital stay: 250 Euro/day). Patients were stratified by gender, age (geriatric and non-geriatric), and length of stay (LoS). Descriptive statistics (median and interquartile range) and statistical analysis (Mann-Whitney test) were conducted using STATA software.

Results: The sample comprised 129 patients (55% female) with a median age of 81 [11] years and a median LoS of 16 [16] days. The median QALY gained was 0.33 [0.38], higher for males (0.35 [0.34]) than females (0.29 [0.45]). Patients younger than 65 years old experienced a greater gain in QALY (0.41 [0.42]) than geriatric patients (0.32 [0.38]) ($p > 0.05$). Patients with a longer LoS had a greater gain in QALY (0.35 [0.42]) than those with a shorter LoS (0.23 [0.29]) ($p < 0.05$). The median cost per QALY gained was 14,337 Euro, lower for males (13,803 Euro), non-geriatric patients (13,743 Euro), and those with a shorter LoS (10,670 Euro) ($p > 0.05$).

Conclusions: Despite disparities in QALY gains between groups, the median cost per QALY gained remained relatively constant. These findings underscore the importance of tailored interventions for effective resource allocation.

Key messages:

- Differences in QALYs indicate the need for personalized healthcare strategies to optimize patient outcomes.
- The constant cost per QALY underlines the importance of effective and efficient allocation of resources.

Abstract citation ID: ckae144.560

Estimated lifetime impact of a school-based intervention for mental health: A microsimulation study

Sarah Bates

S Bates[1], Y Saidi[1], R Cookson[2], I Skarda[2], T Ford[3], R Hayes[4], P Ganguli[5], S Byford[5], A Brennan[1]
[1]Sheffield Centre for Health and Related Research, University of Sheffield, Sheffield, UK

[3]Developmental Psychiatry, University of Cambridge, Cambridge, UK
[4]Department of Psychology, University of Exeter, Exeter, UK
[5]Health Service and Population Research, King's College London, London, UK
Contact: s.e.bates@sheffield.ac.uk

Background: The prevalence of childhood mental health problems is increasing. School-based interventions have the potential to reduce poor mental health and mental health inequalities. Our aim was to estimate the long-term costs and benefits of the Incredible Years Teacher® Classroom Management (IY-TCM) intervention in primary schools compared to no intervention.

Methods: LifeSim, an existing microsimulation model, was used to estimate the lifetime costs and benefits of IY-TCM by linking short-term changes in SDQ based on a previous trial in primary schools (Cluster RCT: 2075 children aged 4-9 years with a 30-month follow-up) to long-term health, social, economic and wellbeing outcomes. Benefits were measured in quality adjusted life years and wellbeing adjusted life years. We examined subgroup based on deprivation, conduct scores and parental depression.

Results: Microsimulation modelling estimated small gains in lifetime outcomes including reduced conduct disorder in adolescence and depression in adulthood. Estimates indicate IY-TCM could be cost-effective with a large amount of uncertainty (Net monetary benefit (NMB)=£21, Estimated CI = -£195, £240). IY-TCM was estimated to be more cost-effective for those with high deprivation (NMB = £231, Estimation CI - -£99, £231) and high conduct problem scores (NMB=£315, Estimated CI = £45, £483). Total net social benefit for a typical year size group was estimated to be £111m.

Conclusions: IY-TCM could be cost-effective compared to no intervention with a large estimated social benefit supporting wider implementation of IY-TCM, but results indicate a large amount of uncertainty. Greater benefits and higher certainty of cost-effectiveness for children with conduct problems and those living in a deprived area suggest IY-TCM has the potential to reduce mental health inequalities and may be more cost-effective for schools with higher deprivation and/or a high prevalence of conduct problems.

Key messages:

- The Incredible Years Teacher Classroom Management intervention for mental health in primary schools could be considered cost-effective but there is a large amount of uncertainty.
- Greater benefits for children with conduct problems and those living in a deprived area indicates the intervention has the potential to reduce mental health inequalities.

Abstract citation ID: ckae144.561

Exploring support for return-to-work: A comparative analysis of firm and country-level factors

Thomas Leoni

T Leoni[1]
[1]University of Applied Sciences Wiener Neustadt, Wiener Neustadt, Austria
Contact: thomas.leoni@fhwn.ac.at

Background: Employers are important stakeholders in efforts to facilitate the return-to-work (RTW) of employees after sick-leave, but the available data reveal large variation in employer support for RTW across European countries and firms. This paper explores in a comparative perspective what factors at the country level and at the firm level can explain these differences.

Methods: Employer support for RTW is examined using microdata covering 31 countries from the Third European Survey of Enterprises on New and Emerging Risks (ESENER), conducted in 2019 ($N = 9{,}775$). These data are integrated with country-level indicators to capture national differences in economic incentives and institutional provisions concerning the management of sick-leave. Two-level mixed-effects logit models with random intercepts are used to estimate the impact that different firm characteristics and country-level factors have on the propensity to provide RTW support.

Results: The empty model has an intraclass correlation coefficient (ICC) of 0.345, indicating that a substantial share of the observed variation across European firms is determined at the country level. Larger establishments and those with workplace health risks are more likely to provide RTW support. Including firm-level indicators does however not reduce the observed between-country variance. Institutional differences in the economic costs of sick leave for employers, on the other hand, explain about 15% of this variance. The ICC drops more strongly after including in the model policy indicators that capture activating elements in the social security system and the existence of national policies targeting RTW. The full model explains almost two thirds (62.8%) of the observed between-country variance.

Conclusions: The findings highlight that only in few European countries employers are systematically involved in RTW support and strengthen the case for comprehensive policy strategies to engage employers in worker activation.

Key messages:

- Employer characteristics, such as firm size, impact the propensity to provide RTW support, but they do not explain the large between-country variation that we observe across Europe.
- Comprehensive national policy strategies and institutional incentives are crucial to engage employers systematically in RTW efforts.

Abstract citation ID: ckae144.562
Cost-effectiveness analysis of screening three-year old for social-emotional problems

Anneli Ivarsson

A Manzano[1], *A-M Pulkki-Brännström*[2], *A Ivarsson*[2], *M Vaezghasemi*[2], *I Feldman*[2,3]
[1]Healthcare, The Swedish Institute for Health Economics, Stockholm, Sweden
[2]Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden
[3]Department of Public Health, Uppsala University, Uppsala, Sweden
Contact: anneli.ivarsson@umu.se

Aim: To assesses the long-term cost-effectiveness of a population-based screening to detect social-emotional problems at 3-years-old combined with an evidence-based intervention to prevent mental health problems.

Methods: A decision-analytic Markov model compares two alternatives 1) all 3-years-old get screened for social-emotional problems, and parents for children at a high risk receive a generic targeting parenting intervention 2) no screening and no intervention. The cohort of 3-year-old is modeled until they are 19 years old. The screening test is the ASQ:SE and the intervention was given to children with scores that suggest social-emotional problems. The model considered development of anxiety, conduct problems, and ADHD, over the 16 years. The analyses were done from a societal and healthcare perspectives. Health outcomes were assessed with DALYs averted.

Results: Results suggest that the probability of population-based screening for social-emotional problems combined with the parenting intervention to high risk-children being cost-effective is high, adopting a societal and healthcare perspective, 98% and 97% each. From a societal perspective, the likelihood of cost saving is high, 85 %. The combination of screening and intervention strongly dominated the comparator.

Conclusions: The findings align with previous research; prevention aimed at children's mental health disorders will likely yield high investment returns. Successful implementation of population-based screening for social-emotional problems combined with an effective evidence-based parenting intervention might be an important way to contribute to sustainable and efficient mental health care.

Key messages:
- The impact of combining population-based screening with intervention is encouraging when considering a long-term view.
- Prevention aimed at children's mental health will likely yield high investment return.

Abstract citation ID: ckae144.563
Cross-country price comparison of institutional long-term care: In search of suitable data

Zuzanna Brzozowska

Z Brzozowska[1], *M Zuba*[1], *G Gredinger*[1]
[1]Health Economics & Health System Analysis, Austrian National Public Health Institute, Vienna, Austria
Contact: zuzanna.brzozowska@goeg.at

Background: In European ageing societies, the national expenditure on institutional long-term care (LTC) has been growing for decades, currently exceeding 1% of the GDP in many countries. At the same time, however, comparative analyses of (day) prices in the nursing and residential care facilities (NRCFs) are still lacking. The data reported by international databases vary substantially in the services they cover which makes cross-country comparisons very difficult.

Methods: We combine publicly available data from Eurostat (System of Health Accounts), OECD and national sources on the number of recipients of LTC in NRCFs, the number of beds in NRCFs and the expenditure on LTC in NRCFs in over 20 European countries. Our aim is to compute internationally comparable daily prices of LTC in NRCFs using gross-costing approach. We first validate the data by cross-checking and documenting which health care functions and providers are reported by each country. Second, based on that we identify countries with comparable data and, third, perform a cross-country comparison of the daily spending on LTC in NRCFs.

Results: The reported data vary substantially with respect to their coverage. For instance, while some countries include NRCFs for all disabled people at all ages, others focus only on the NRCFs for the elderly. The ways the beds and the recipients are counted also show substantial variation. Moreover, we found inconsistencies in the reported numbers not only between but also within countries.

Conclusions: The considerable cross-country diversity in the LTC provision within the NRCFs poses inevitable challenges to international standardised reporting. Our analysis shows, however, that at least some of the challenges can be overcome by, e.g. improving the consistency of the reported numbers at the country level.

Key messages:
- A consistent definition application markedly improves the comparability of data on LTC in NRCFs.
- Given the rising demand for and economic importance of the LTC sector standardised data on NRCF services are greatly needed.

Abstract citation ID: ckae144.564
Changes in opinions on health insurance benefits deservingness in the Netherlands between 2013-2023

Marloes Meijer

MA Meijer[1], *AEM Brabers*[1], *JD De Jong*[1,2]
[1]Healthcare System and Governance, NIVEL, Utrecht, Netherlands
[2]Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands
Contact: m.meijer@nivel.nl

Background: In many European countries, including the Netherlands, the healthcare system is financed according to the principles of solidarity. Although people are generally highly supportive of collectively financed healthcare services, some groups are considered more deserving of health insurance benefits than others. Increasing knowledge of the health risks of certain lifestyle choices and pressure on healthcare systems may result in changing opinions on the allocation of resources. Our study looks into changes in citizen's opinions on the deservingness of different groups between 2013 and 2023.

Methods: Questionnaires were sent out to samples of 1.500 members of the Dutch Health Care Consumer Panel in 2013, 2015, 2017, 2019, 2021, and 2023. Response rates varied between 42% (2015) and 56% (2021). Deservingness was studied by asking respondents about their opinions on the amount of health insurance premium for different, opposing groups, for example older and younger people and those with a healthy and unhealthy lifestyle (group A should pay more, both groups should pay the same amount, or group B should pay more). Multinominal logistic regression models were used to examine changes in deservingness opinions over time.

Results: Our study showed year-to-year fluctuations in opinions on the premium amount for health insurance for different, opposing groups. However, no distinct increases or decreases were observed over the whole time period. This applies to both the general population and to people who do and do not belong to the different groups.

Conclusions: Although there are differences in the degree to which groups are considered deserving of health insurance benefits, deservingness opinions were found to be fairly stable in the Netherlands between 2013 and 2023. Our results do not point to increasing support for premium differentiation based on personal characteristics. This suggests that support for solidarity in healthcare financing is not in decline.

Key messages:

- Opinions on the deservingness of health insurance benefits of different groups were found to be fairly stable in the Netherlands between 2013 and 2023.
- No evidence of increasing support for premium differentiation based on personal characteristics was found.

Abstract citation ID: ckae144.565
The corporate political activity of Portugal's food industry: enhancing public health transparency

Sofia da Costa

Contact: sofiacarvalhodacosta@gmail.com

Background: This study in Portugal aims to monitor the Corporate Political Activity (CPA) in the food industry. Portugal provides a compelling case study due to its robust implementation of public health policies.

Methods: A systematic qualitative approach proposed by Mialon et al., a part of the INFORMAS Module 3, was employed. This method is based on the analysis of publicly available information. Key industry actors were selected through expert consultation and market analysis using EuroMonitor data. Information sources included industry, government, and academic materials accessed via websites and news. A thematic qualitative analysis was conducted involving iterative steps: identifying CPA practices based on predefined strategies - Taxonomy of Action Strategies: access and influence policymaking, use the law to obstruct policies, manufacture public support, shape evidence, displace and usurp public health, and manage reputations -, recording methods in a database, and saving evidence. Data collection spanned October 2023 to April 2024, covering materials from 2022 to 2023.

Results: Twenty-five key players were identified, including processed food and non-alcoholic beverage manufacturers, fast food companies, food retailers, and national trade associations. Food retailers, notably Jerónimo Martins, Lidl, Mercadona, and Sonae, showcased a higher prevalence of CPA. Nestlé and Sumol+Compal also emerged as prominent actors. The food industry in Portugal employs diverse strategies and tactics primarily focused on shaping evidence and managing reputations. While instances of displacing public health priorities and manufacturing public support were observed, they were relatively fewer. Only APED and FIPA showed engagement in policymaking influence.

Conclusions: Vigilant monitoring of CPA in the food industry in Portugal reveals dominant tactics of shaping evidence and managing reputations. Understanding these strategies is vital for policymaking to safeguard public health.

Key messages:

- The food industry in Portugal employs diverse strategies, primarily shaping evidence and managing reputations, to influence public health policies.
- Monitoring the Corporate Political Activity is key to preserving the integrity of public health policymaking in Portugal's food industry.

[3]Department of Public Health, Aarhus University, Aarhus, Denmark
[4]Department of Physiotherapy and Occupational Therapy, Aarhus University Hospital, Aarhus, Denmark
Contact: anngrora@rm.dk

Background: Effective collaboration among stakeholders is essential in supporting return to work (RTW) processes for individuals on sick leave. Yet sickness benefits office and general practice experience a lack of collaboration. This is echoed by individuals on sick leave. This scoping review aim to map existing literature on collaboration between sickness benefits office and general practice in RTW processes to identify both collaboration activities and underlying conditions influencing the collaboration.

Methods: A systematic search of peer reviewed literature was conducted across five databases in March 2023. Screening and data extraction were conducted by two independent researchers. Extracted data was mapped and activities and underlying conditions were analyzed following descriptive thematic analysis. Tentative results were discussed with a reference group.

Results: Among the 7471 papers screened, 21 met the inclusion criteria. Certificates was the most common collaboration activity. Of underlying conditions far more barriers compared to facilitators were identified. Barriers encompassed conflicting opinions, opposing roles, communicating via certificates, and time. Facilitators included personal communication and knowledge.

Conclusions: The number of included papers reflects a limited emphasis on this domain within research endeavors. The prevalence of barriers outweighing facilitators underscores the challenges inherent in this collaboration. General practice is depicted as advocating for their patients while the sickness benefits office pushes for return to work. Scarcity of time induces several challenges, impacting e.g., availability for personal communication and delays.

Key messages:

- Stereotyping and opposing roles, poor communication and time constraints are major barriers that need to be addressed to enhance future collaboration.
- Meetings and mutual knowledge about working conditions including legislations and procedures benefit the collaboration.

Abstract citation ID: ckae144.567
Employees' work ability during returning to work with common mental disorders: a mixed methods study

Alexandra Sikora

A Sikora[1,2], *R Stegmann*[1], *UB Schröder*[1], *IL Schulz*[1], *U Wegewitz*[1], *U Bültmann*[2]
[1]Division 3 Work and Health, Federal Institute for Occupational Safety and Health, Berlin, Germany
[2]Department of Health Sciences, University Medical Center Groningen, Groningen, Netherlands
Contact: Sikora.Alexandra@baua.bund.de

Background: A main goal during the return to work (RTW) process after a long-term sickness absence due to common mental disorders (CMDs), is to restore and maintain an employees' work ability to enable sustained work participation. To date, surprisingly little research has examined the concept of work ability during the RTW process with CMDs. To better understand how to restore employees' work ability during RTW with CMDs, both quantitative and qualitative research is needed. The goal of this mixed methods study is to expand the understanding of restoring work ability during the RTW process with CMDs.

Methods: In this mixed methods follow-up study of N = 286 participants, work ability was quantitatively assessed with the Work Ability Score (WAS, range 0-10) at five measurement points (0, 6, 12, 18 and 30 months) during 30 months of follow-up. In a subsample, the qualitative work ability experiences of N = 32 participants were jointly analysed with their quantitative work ability ratings at 6 and 12 months.

Results: In the joint analysis, three groups of qualitative work ability experiences together with their respective quantitative work ability ratings emerged: Employees with (1) poor work ability (WAS 0-3), who did not RTW yet and described great difficulties in coping with everyday life; (2) moderate work ability (WAS 4-6), who mainly did RTW, but still showed a certain level of fragility; and (3) good to very good work ability (WAS 7-10), who mainly returned within 12 months and reported many individual and work accommodations to restore and maintain their work ability.

Conclusions: The joint evaluation of work ability ratings and experiences allowed a deeper understanding of restoring work ability during the RTW process. This knowledge may help occupational health professionals and other key RTW stakeholders to provide more tailored support during the RTW process and to promote a sustainable RTW for employees with CMDs.

Key messages:

- Restoring and maintaining the work ability of employees with common mental disorders during the return to work process is crucial for their sustained work participation.
- Achieving a good to very good work ability helps returning employees with common mental disorders to 'stay and thrive' at work again.

Work resumption and economic independence among women with paid employment one year after childbirth

Loes Bertens

LCM Bertens[1], *KSC Mohabier*[1], *L van der Meer*[1], *AJM Waelput*[1], *A Burdorf*[2], *EAP Steegers*[1]
[1]Department of Obstetrics and Gynecology, Erasmus MC, Rotterdam, Netherlands
[2]Department of Public Health, Erasmus MC, Rotterdam, Netherlands
Contact: l.bertens@erasmusmc.nl

Background: In Europe, women are more likely to be unemployed compared to men. Also, they more often hold part-time employment. After pregnancy and childbirth, women often reduce their working hours further or even exit the workforce altogether. This not only impacts their individual career, financial stability, and economic independence, but also their own health and well-being and that of their offspring.

Objectives: We aim to study the patterns of women's work resumption in the first year after childbirth, and if sick leave during pregnancy and birth outcomes small for gestational age (SGA) and preterm birth play a role in this. Data from Statistics Netherlands and the Dutch Perinatal Registry from 114,722 Dutch pregnant women in paid employment (2016) were used for the analyses. Next to descriptive analyses, multivariate regression was used to assess which factors contribute to economic independence one year after childbirth.

Results: After pregnancy, over 50% of women reduced their working hours, and 12% became unemployed. The largest reduction was found in the group working fulltime (from 31 to 11%), in contrast, the group working 20-25 hours per week increased from 19 to 28% one year after childbirth. Among the women with sick leave during pregnancy (11%), the decrease in working hours was more pronounced and almost 40% of them became unemployed. The percentage of women being economically independent changed from 88% at the onset of pregnancy to 78% one year after childbirth. Next to employment factors (working hours and contract type), migration background and lower education were associated with lower odds of economic independence. Moreover, sick leave during pregnancy and having a SGA baby also reduced the odds of economic independence.

Conclusions: After pregnancy, women tend to work less than before, or even exit the workforce, with considerable impact on their economic independence. This is even more pronounced in the group with sick leave during pregnancy.

Key messages:

- Despite paid maternity leave, pregnancy and childbirth negatively impact work force participation in women.
- The need for sick leave during pregnancy is predictive of reduced work resumption and economic independence one year after pregnancy.

Abstract citation ID: ckae144.569
Sickness absence due to mental and somatic diagnoses by occupational class in Finland, 2011–2021

Jenni Blomgren

J Blomgren[1], *R Perhoniemi*[1]
[1]Research Unit, The Social Insurance Institution of Finland, Kela, Finland
Contact: jenni.blomgren@kela.fi

Background: Sickness absence (SA) due to mental disorders has strongly increased in Finland during recent years while sickness absence due to somatic diagnoses has continued to decrease. Research is lacking on recent trends in SA by occupational class, especially during years of increasing mental disorders. The aim of the study is to analyze these trends during 2011-2021.

Methods: National register data from the Social Insurance Institution of Finland (Kela), Statistics Finland and Finnish Centre for Pensions were linked for all employed Finns aged 25-64 for years 2011-2021 (yearly N about 2 million). SA was measured by sickness allowance, compensated by Kela after 10 days of absence. Age-standardized yearly prevalences of SA due to different diagnoses were calculated for women and men in four occupational classes over 2011-2021. Logistic regression was used to assess differences between occupational classes adjusted for age, marital status, education and region of residence.

Results: SA due to mental disorders has greatly increased in all occupational classes in Finland after year 2016 among both women and men, while SA due to musculoskeletal and other somatic diagnoses has continued to decrease. Increase in SA due to mental disorders has been largest among lower non-manual employees, especially among women, whereby also overall SA prevalence among female lower non-manual employees has reached the level of manual workers. Men show broadly similar trends but manual workers still have the highest overall SA prevalence. Relative adjusted differences between occupational classes decreased slightly between 2011 and 2021.

Conclusions: Clear occupational class differences persisted in diagnosis-specific SA throughout 2011-2021. However, the magnitude and order of the class differences changed along with increasing SA due to mental disorders. Occupational class differences should be taken into account when aiming to prevent further increases in SA due to mental disorders.

Key messages:

- Sickness absence (SA) due to mental disorders has increased in all occupational classes in Finland after year 2016, while SA due to somatic diagnoses has continued to decrease.
- Increase in SA due to mental disorders has changed the overall occupational class differences in SA in Finland largely because the increase has been strongest among lower non-manual employees.

Abstract citation ID: ckae144.570
Assessing the return-to-work mode of Dutch precarious workers with mental health issues

Yvonne Suijkerbuijk

Y Suijkerbuijk[1,2,3], *K Nieuwenhuijsen*[1,2,3], *LP Jansen*[1,2,3], *FG Schaafsma*[1,2]
[1]Department of Public and Occupational Health, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands
[2]Amsterdam Public Health Research Institute, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands
[3]Research Center for Insurance Medicine, Amsterdam, Netherlands
Contact: y.b.suijkerbuijk@amsterdamumc.nl

Background: Mental health issues are highly prevalent among precarious workers, often leading to sickness absence, work disability, and job loss. Return to work (RTW) is more challenging for these workers, as they often lack a job to return to and have limited access to occupational health care. Perceptions and attitudes about RTW are important determinants and can be categorized into three modes within the RTW process: a passive, an ambivalent and an active RTW-mode. To identify the RTW mode, we developed the RE-MODE tool. This study aimed to assess occupational health professionals' agreement on the RTW-mode of sick-listed precarious workers with mental health issues using RE-MODE.

Methods: In a vignette study, 71 occupational health professionals from a Dutch social security institute viewed six videos of consultations between insurance physicians and precarious workers. They then used RE-MODE to assess the RTW mode and need for RTW-support. They also provided feedback on the tool's validity and usability. We used a generalized linear mixed model to analyze inter-rater agreement, inter-item consistency, and the contribution level of each item. Additionally, we calculated the content validity index and the system usability scale.

Results: The agreement on the RTW mode with RE-MODE is high (ICC 0.86, 95% CI 0.64-0.95) and on the workers' need for RTW-support moderate (0.61, 95% CI 0.31-0.84). Furthermore, the content-validity (Scale-CVI 0.83), usability (SUS 0.75), and inter-item consistency (Cronbach's Alpha 0.70) show favorable results. We are currently analyzing the contribution of each item to the total score. The items with the best overall performance will be included in RE-MODE 2.0.

Conclusions: REMODE is a valuable tool for occupational health professionals to identify precarious workers with mental health issues at risk of long-term disability. Then they can arrange targeted RTW-support. Based on the study results, RE-MODE 2.0 is in development.

Key messages:

- RE-MODE is a valuable tool for the assessment of the RTW-mode of precarious workers with mental health issues.
- RE-MODE's reliability, content-validity and usability is satisfactory.

Abstract citation ID: ckae144.571
Having paid work 1 year after disability claim in different types of mental and behavioural disorders

Manon Ziech

MLW Ziech[1,2,3], *T Hoekstra*[1,2], *HJ Boersema*[1,2], *S Brouwer*[1,2]
[1]Health Sciences, UMCG, Groningen, Netherlands
[2]Research Center for Insurance Medicine, Amsterdam, Netherlands
[3]Dutch Social Security Institute, Amsterdam, Netherlands
Contact: m.l.w.koopman-ziech@umcg.nl

Background: The majority of claimants diagnosed with a mental and/or behavioral disorder have residual work capacity, however, the chance of actual (return to) work after a disability claim assessment may differ within this diagnosis group depending on the specific type of disease. The aim of this study is to examine the associations of different mental and behavioural diseases with having paid employment one year after the claim assessment.

Methods: This longitudinal register based cohort study included all work disability applicants with mental and behavioural disorders assessed with residual work capacity in the Netherlands in 2016. Data were derived from the Dutch Social Security Institute (UWV) and were linked to register data on paid employment. ICD codes were used to categorize 11 disease groups (mental retardation, autism spectrum disorders, ADHD, somatoform disorders, adjustment disorders, PTSS, anxiety, personality disorders, mood affective disorders, addictions and delusional disorders. Multivariable logistic regression analyses were conducted separately for applicants who work and not work at time of the claim assessment.

Results: A total of 8544 claimants (mean age 45, 56% female; $n = 1915$ work at baseline) were included. In the working group being diagnosed with ADHD (OR 3.05, CI 1.08-8.61) or PTSS (OR 1.45, CI 1.04-2.02) was associated with paid work, and adjustment disorder was negatively associated (OR 0.74, CI 0.56-0.97). In the not-working group, autism spectrum disorder (OR 1.51, CI 1.02-2.22), personality disorder (OR 1.36, CI 1.02-1.81) and addiction (OR 1.94, CI 1.32-2.86) was associated with return to work, and somatoform (OR 0.51, CI 0.31-0.84) disorders and mood affective disorders (OR 0.83, CI 0.70-0.99) were negatively associated.

Conclusions: The findings of this study show different associations between type of mental and behavioural disease groups and paid employment one year after the claim assessment.

Key messages:

- The association of either remaining at work or return to work is different among mental and behavioural diagnosis groups, therefore a different approach is indicated.
- Active interventions to facilitate return to or remain at work might be indicated in specific diagnosis groups.

Abstract citation ID: ckae144.572
Impact of motherhood and social support on the wellbeing of UK female police officers and staff

Mahnoz Illias

M Illias[1], *E Demou*[1], *K Riach*[2]
[1]MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK
[2]Adam Smith Business School, University of Glasgow, Glasgow, UK
Contact: m.illias.1@research.gla.ac.uk

Background: Female officers and staff face gender-specific challenges, particularly, during pregnancy and motherhood. Our study explores whether and how motherhood affects mental health outcomes (e.g., probable depression and anxiety) and return to work following sickness absence (SA), considering mediating role of workplace social support.

Methods: Logistic regression analysed probable depression and anxiety using Airwave Health Monitoring Study (AHMS) data. Cox proportional hazards models assessed return to work after sickness absence, linking AHMS with sickness absence data from 26 police forces. Exposure variables were created by the interaction of motherhood status and social support, while covariates included sociodemographic, lifestyle, and work-related factors.

Results: Mothers with low social support from superiors had higher odds of probable depression (OR = 2.14, 95% CI = 1.81-2.54) and anxiety (OR = 1.86, 95% CI = 1.62-2.14) compared to non-mothers. Moderate and high social support reduced odds of depression (Moderate: OR = 0.97, 95% CI = 0.85-1.11; High: OR = 0.65, 95% CI = 0.57-0.73) and anxiety (Moderate: OR = 1.24, 95% CI = 1.12-1.36; High: OR = 0.82, 95% CI = 0.75-0.9) for mothers, but the impact varied when adjusted for covariates. Mothers with lower levels of social support were less likely to return to work after SA compared to non-mothers, as indicated by the survival analysis (Low social support: HR = 0.83, 95% CI = 0.95-1.13; High social support: HR = 1, 95% CI = 0.96-1.04). These trends persisted across social support sources-colleagues and combined support-emphasising the complex interplay between workplace social support, motherhood, mental health, and sickness absence in policing.

Conclusions: Our study emphasises boosting workplace social support for female police officers and staff, to aid them in navigating motherhood demands. This improvement can lead to better mental health, retention, job satisfaction, and organisational effectiveness, ultimately promoting community safety.

Key messages:

- Highlighting the importance of workplace social support for female police officers and staff, informs policy makers and practitioners to prioritize social support initiatives within policing.
- Lower social support was associated with a reduced likelihood of returning to work after sickness absence, particularly among mothers compared to non-mothers.

9.G. Oral presentations: Risk factors in the development of NCDs

Abstract citation ID: ckae144.573

How likely are Eastern European and Central Asian Countries to Achieve Global NCD Targets?

Anastasiya Dumcheva

A Dumcheva[1], *J Nevalainen*[1], *T Laatikainen*[2], *P Nuorti*[1]
[1]Faculty of Social Sciences, Tampere University, Tampere, Finland
[2]Faculty of Health Sciences, University of Eastern Finland, Kuopio, Finland
Contact: anastasiya.dumcheva@tuni.fi

Background: In Europe, premature deaths from noncommunicable diseases (NCDs) have declined significantly, except in twelve countries of Eastern Europe and Central Asia (EECA), namely Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine and Uzbekistan. Analyses of the long-term trends of NCD premature mortality in EECA are limited making it hard to know what to expect over the next years.

Methods: We used the 1990-2019 Global Burden of Disease database to analyze NCD trends and identify country-specific change points by using piecewise linear regression. We assessed the likelihood of achieving NCD global targets (GTs) to reduce premature mortality among persons 30-69 years old from four NCDs: cardiovascular diseases (CVD), cancers, diabetes mellitus (DM) and chronic respiratory diseases (CRD) by 25% from 2010 to 2025 (WHO25X25 target) and by 33% from 2015 to 2030 (SDG 3.4.1).

Results: Only Kazakhstan and Russia are likely to achieve NCD-GTs. For Kazakhstan, WHO25X25 and SDG 3.4.1 GTs mortality rates were 494.3 and 374.8 per 100,000 population respectively; the corresponding predicted values (PVs) were 360.6 [CI 260.1-461.1] and 245.1 [CI 113.4-376.8]. For Russia, WHO25X25 and SDG 3.4.1 GTs were 560.5 and 442.8 per 100,000 population respectively; the corresponding PVs were 427.7 [CI 270.3-585.1] and 311.0 [CI 102.8-519.1]. Achieving NCD-GTs is also possible for Kyrgyzstan. For the rest of EECA countries achieving NCD-GTs is unlikely. All EECA countries have increasing premature mortality from DM, eleven - from CRD and cancers, and six - from CVD. Most EECA countries have higher NCD rates and slower progress among men compared with women.

Conclusions: In most EECA countries the trend towards achieving NCD-GTs is slow or reversed. Further quantitative and qualitative research is needed to understand the underlying reasons. Separate indicators are needed to monitor countries' progress for cancers, DM and CRDs.

Key messages:

- Most EECA countries have slow or reversed trend in achieving NCD-GTs. All EECA have increasing premature mortality from DM, eleven – from CRD and cancers, and six – from CVD.
- Further research is needed to understand the underlying reasons for slow progress towards NCD-GTs in EECA. Separate indicators are needed to monitor progress for cancers, DM and CRDs.

Abstract citation ID: ckae144.574

Ultra-processed food intake and type 2 diabetes: A dose-response meta-analyses of prospective studies

Yujin Kim

Y Kim[1,2], *H Oh*[1,2,3]
[1]Department of Public Health Sciences, Korea University, Seoul, South Korea
[2]Interdisciplinary Program in Precision Public Health, Graduate School of Korea University, Seoul, South Korea
[3]Division of Health Policy and Management, Korea University, Seoul, South Korea
Contact: iamyujin@korea.ac.kr

Studies suggested a positive association between ultra-processed food (UPF) intake and risk of type 2 diabetes (T2DM). However, the magnitude of association varies across studies due to differences in population characteristics and methodological issues. It is also unclear about the exact shape of the association and whether the association is independent of diet quality and adiposity. We conducted a dose-response meta-analysis of prospective studies to summarize the association between UPF intake and T2DM risk. PubMed/MEDLINE, Web of Science, and Embase were searched through Jan. 2024 to identify relevant studies. Using random-effects models, summary relative risks (RRs) and 95% confidence intervals (CIs) were estimated for each of the following unit increment in UPF intake: 10% (of total g/d), 100-g/d, and 1-serving/d. A non-linear dose-response meta-analysis was conducted using restricted cubic spline analysis. After screening 569 publications, 12 prospective cohort studies were included in this study. The summary RRs associated with every 10%, 100-g, and 1-serving increment in UPF intake were 1.13 (95% CI = 1.10-1.16), 1.05 (95% CI = 1.03-1.06), and 1.04 (95% CI = 1.03-1.05), respectively. The positive associations remained statistically significant after additional adjustment for diet quality, BMI, and total energy intake. The dose-response curve for g/d of UPF intake suggested evidence of nonlinearity (p-nonlinearity=0.0005), showing a steeper increase in risk at UPF intake >300 g/d. However, evidence for non-linearity was not observed with % and serving/d of UPF intake. The association did not significantly vary by method and timing of UPF assessment. Higher summary RRs were observed among studies from Europe and North America compared with those from other countries (p-heterogeneity=0.048). Our data suggest that higher UPF intake may increase T2DM risk, independent of diet quality and adiposity.

Key messages:

- Higher intake of ultra-processed food is positively associated with the risk of type 2 diabetes.
- Public health strategies should encourage healthier dietary choices by emphasizing reduction of UPF intake in dietary guidelines and implementing regulations on manufacturing and labeling of UPF.

Abstract citation ID: ckae144.575
Ultra-processed food consumption and risk of coronary heart diseases: UK Whitehall II cohort study

Mengmei(eunice) Wang

ME Wang[1], *C Llewellyn*[2], *M Kastoulis*[3], *A Britton*[1]
[1]Institute of Epidemiology and Public Health, University College London, London, UK
[2]Behavioural Science and Health, University College London, London, UK
[3]MRC Unit for Lifelong Health & Ageing, University College London, London, UK
Contact: mengmei.wang.21@ucl.ac.uk

In recent decades, ultra-processed foods (UPFs) intake has increased drastically, sparking concerns about their potential impact on cardiometabolic diseases. However, large-scale cohort studies tracking UPF consumption at multiple time points remain limited. This study explores the prospective association between repeated measures of UPF intake and the risk of coronary heart disease (CHD), along with its secondary endpoints, within the UK Whitehall II study. The analytical sample tracked 7,138 midlife British participants without CHD from baseline. UPF consumption was measured using validated food frequency questionnaire (127 items) and classified by the NOVA system during three phases: 1991/1994 (phase 3), 1997/1999 (phase 5), and 2002/2003 (phase 7). This study assessed the onset of CHD and its secondary endpoints, including CHD and all-cause mortality, through medical exams and hospital records up to 2016 and 2021, respectively. Cox proportional hazards regression models adjusted for socio-demographics, lifestyle factors and total energy intake were used to explore the prospective association between cumulative average UPF intake (in quintiles) and CHD outcomes. During a median follow-up of 13 and 19 years, 589 cases and 1,314 deaths were documented. In multivariable adjusted cox models, the highest UPF consumption quintile versus the lowest quintile was associated with higher CHD incidence [HR:1.26; 95% Confidence Interval (CI): 1.02-1.55; p = 0.03]. Additional adjustment of total energy intake increased the CHD risk by 28% [HR:1.28; 95% CI: 1.03-1.58; p = 0.02]. No significant relationships were found between cumulative average UPF intake and CHD or all-cause mortality. In UK midlife adults, higher UPF intake is prospective associated with increased CHD risk. Although additional research is warranted, these findings emphasize the importance of public awareness and food policy interventions to reduce UPF intake for alleviating the population burden of CVD.

Key messages:

- Our study suggests the need for increased efforts to implement population wide strategies on regulating food processing, such as taxation and front of package warning labelling of UPF.
- Our study emphasizes UPF's role in cardiovascular prevention, highlighting the need for nutrition counseling on UPF consumption for those at risk of CVD.

[3]Nantes University, CHU Nantes, CNRS, INSERM, L'institut du Thorax, Nantes, France
Contact: xuan.le-folcalvez@eren.smbh.univ-paris13.fr

Background: Social jetlag corresponds to the misalignment between biological circadian rhythms and the social rhythm imposed by society, resulting in discrepant activity/sleep schedules during work and free days. It has been associated with worsened biological parameters such as BMI or glycemic control. Eating jetlag is a related yet emerging concept defined as the difference of meal timing between free and work days. However, it has been little explored. This study aims to evaluate the association between eating jetlag and the risk of cardiovascular disease (CVD).

Methods: Dietary, anthropometric, socio-demographic and health data of 104,837 participants (79% women, mean age=42.7 years (14.6 SD)) were collected from the NutriNet-Santé cohort. Eating jetlag was calculated using time of first and last meals on weekdays and weekends, from repeated 24 dietary records, averaged during the 2 first years. It was assessed as a continuous variable or as 3 categories: 'Advance', 'Maintenance', 'Delay', compared to work days. CVD was self-reported and validated against medical records. The associations between eating jetlag and CVD risk were assessed through adjusted Cox models.

Results: During a median follow-up time of 8.1 years, 2,368 CVD cases were diagnosed. Eating jetlag showed a U-shaped association with CVD risk (HR Advance vs. Maintenance=1.05(95% CI: 0.87-1.26); HR Delay vs. Maintenance=1.08(0.96-1.21)). When the absolute value of eating jetlag was considered, there was a linear association with CVD risk (HR per 1-hour increase=1.05(1.00-1.12)). These linear trends were confirmed in categorial models (Low: ≤1h; Moderate: 1h< to ≤ 2h; High: >2h): HR Moderate vs. Low=1.05(0.94-1.18), and HR High vs. Low=1.13(0.94-1.37); however, statistical significance was not reached.

Conclusions: Our results suggest a potential role for meal timing regularity between free and work days in CVD etiology. They need to be replicated in other studies and mechanisms are yet to be fully understood.

Key messages:

- Adopting regular meal timing schemes on work and free days could be associated with a lower risk of cardiovascular diseases.
- Meal regularity between work and free days could play a role in cardiovascular health and should be further investigated.

Contact: carin.staland_nyman@hh.se

Background: Work is vital to people's health and quality of life. The Convention on the Rights of Persons with Disabilities affirms the right to work on an equal basis with others including an opportunity to earn a living by work, but evidence shows that people with intellectual disability (ID) are at greater risk of unemployment and social exclusion. Due to the lack of comprehensive data for longitudinal follow-ups, information on long-term labor market participation (LLMP) in people with ID is scarce. This study aimed to investigate factors of importance for LLMP in individuals with ID in Sweden.
Methods: The study was based on data from the upper secondary school for pupils with ID between 2001 and 2020 (N = 26,905) and from the longitudinal integrated database for health insurance and labor market studies. A sample of gainfully employed in 2011 (n = 2,719), was followed with respect to LLMP until 2020. Odds ratios (ORs) with 95% confidence intervals (CI) for associations between educational, sociodemographic, and work factors and LLMP (i.e. gainful employment throughout the follow-up), were estimated stratified on sex.
Results: LLMP was twice as likely in men compared with women, OR 2.06 (1.78-2.58) as was work in the private sector. Factors of significance for LLMP in men and women alike were: completed national education program, OR 3.40 (3.06-3.86) and OR 2.91 (2.40-3.54), parents' education; compulsory school in mothers', OR 1.22 (1.06-1.41) and 1.24 (1.00-1.55) and in fathers' OR 1.35 (1.17-1.56) and 1.49 (1.20-1.85), while municipality of residence was significant only in men, OR 1.30 (1.10-1.56).
Conclusions: Public health prevention for disadvantaged groups requires accurate and up-to-date knowledge. Using unique register-based data, this is the first study on LLMP in people with ID in Sweden. Knowledge on what social determinants may strengthen LLMP is important since limited LLMP increases the risk of missing out on health benefits that employment may offer.
Key messages:
- There was a significant gender difference in long-term labor market participation in people with intellectual disability in Sweden.
- There is a need for increased knowledge on what social determinants may strengthen long-term labor market participation in people with intellectual disability.

Precarious employment expectancy by history of mental-health-related sickness absence in Finland

Taina Leinonen

T Leinonen[1], *L Salonen*[1], *E Hartikainen*[1], *T Bodin*[2], *S Solovieva*[1]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
[2]Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden
Contact: taina.leinonen@ttl.fi

Background: Poor mental health may lead to labour market insecurity including precarious employment and vice versa. Less is known of how mental health is associated with cumulative engagement in precarious employment over the working career. We examined how the working career is expected to be distributed into precarious and other types of employment by history of mental-health-related sickness absence.
Methods: We used a register-based 70% population sample to examine wage-earners living in Finland in 2018. Applying the Sullivan method, we calculated the expectancy of precarious and non-precarious employment between age 25 and 63 (N = 1268666) based on a novel measure (score with items on temporariness, agency employment, multijob holding, underemployment and income level) and limited employment (due to which precariousness could not be assessed) among those with and without compensated (granted after 10 weekdays) sickness absence due to mental disorders in the past five years (mental SA history).
Results: Precarious employment expectancy was higher among those with than among those without a mental SA history (2.5 vs. 1.5 among men and 3.5 vs. 2.8 years among women). The difference in the limited employment expectancy was in the same direction, but much larger among men (6.5 vs. 3.3 among men and 4.4 vs. 3.4 years among women). Men with a mental SA history were expected to spend almost a fourth of their working career with either precarious or limited employment, whereas for men without such a history the number was 13%.
Conclusions: Individuals with mental disorders have notable accumulation of precarious employment over the working career. They also spend excessive time with limited employment, which may have similar elements as precarious employment and reflect broader labour market insecurity. Attempts should be made to ensure that insecure employment conditions among people with mental health problems do not further deteriorate their health and work ability.
Key messages:
- People with mental disorders spend a disproportionate part of their working career either precariously employed or facing other insecurities in the labour market.
- Interventions aiming to promote health and work ability should take into account the interplay between poor mental health and poor employment conditions.

Abstract citation ID: ckae144.579
Predictors of disability retirement - a prediction model for disability pension application risk

Petra Sohlman

P Sohlman[1]
[1]Keva, Helsinki, Finland
Contact: petra.sohlman@gmail.com

Background: Regarding the objective of preventing early exits from labor market, the late life-course years present an important timeframe. It is essential to identify the employees in the greatest risk of permanently losing their work ability. In practical applications, multifactorial models are needed to evaluate the combined effect of risk factors. In this study, the disability pension risk is modeled based on large unique register data, at the same time assessing the effect of sickness absences (SA) of different lengths.

Methods: We utilize a logistic model for the risk of filing a first-time disability pension application (DPA) based on register data on 222,321 Finnish municipal sector employees. The data include employment and sickness spells, occupations, and wages in 2016-2018 as covariates. During the 3-year follow-up, 2,969 employees filed a DPA. The data include also short SA spells, a novelty in these kinds of studies. DPA is used as a follow-up to include employees who receive a rejecting decision but still carry a physician's evaluation of diminished work ability.

Results: The resulting model can accurately predict the risk of DPA in employee groups. Age, occupation, cumulative SAs preceding the application, and the number of SA spells of all lengths, also short ones, have a significant increasing effect on the DPA risk. Proximity of the retirement age and high earnings decrease the risk of DPA. Surprisingly gender had no effect on the risk.

Conclusions: The results indicate that register-based sociodemographic data is very useful in modeling the employee DPA risk in public sector employee groups. The resulting model provides a basis for tools for predicting the risk status of employee groups for the use of employers responsible for risk management and early intervention, also allowing for the assessment of economic effects of SAs and disability risk. The presented modeling results are already utilized among public sector employers in Finland.

Key messages:

- Disability pension risk can accurately be predicted in public sector employee groups based on readily available sociodemographic register data.
- All sickness absences have a significant increasing effect on the risk of disability pension application, but the effect varies greatly depending on age and occupation.

Healthcare access for people with disabilities: a scoping review of COVID-19 policies in Europe

Jeny Alejandra Aguilera Cruz

J Aguilera Cruz[1,2], *T Krafft*[1,3], *M Padeiro*[4]
[1]Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands
[2]Europubhealth+, EHESP, Rennes, France
[3]CAPHRI, Maastricht University, Maastricht, Netherlands
[4]CEGOT, University of Coimbra, Coimbra, Portugal
Contact: aleja.aguilerac@gmail.com

Introduction: The COVID-19 pandemic raised healthcare inequalities, affecting the most vulnerable groups. There is limited evidence of whether the COVID-19 measures and the health system's preparedness for outbreaks among European countries were sufficient to cover the health access needs of PWDs.

Aim: To provide a structured overview of the COVID-19 measures and policies addressing access to primary and specialist health services for PWDs during the COVID-19 pandemic in the European Members States (MS) and the United Kingdom (UK), using ten dimensions of healthcare access by Levesque et al. (2013) and the PoliMap taxonomy.

Methods: This study followed the PRISMA guidelines for Scoping Reviews. A search strategy was employed on PubMed, Embase, Scopus, and Web of Science databases from January 2020 to January 2023. Studies published in peer-reviewed journals in English, Portuguese, and Spanish were included, informing a COVID-19 measure or policy and assessing or providing a rationale with access to primary or special healthcare services.

Results: The final search strategy yielded 2.076 results, 188 studies were reviewed for full-text analysis, and 74 were included in the final analysis. One hundred twenty-one policies or measures addressing primary or specialist care access were identified. Only thirteen target PWDs, focussing on intellectual or mental disability and addressing mental healthcare services. Results revealed that COVID-19 measures for PWDs were oriented to increase health system response capacity and reduce virus transmission, describing a predominantly negative effect on healthcare access for PWDs.

Conclusions: The needs of PWDs in access to primary and specialist care were not fully covered by the policies and measures placed during the COVID-19 pandemic among the MS and the UK. One-size approaches focussing on the attendance of COVID-19 infection with stigmatizing measures overlook the specific health necessities of this population.

Key messages:

- Adopting disabled-inclusive measures in the daily healthcare provision and engaging PWDs in the policy cycle is paramount to preparing for the next outbreak and public health crises.
- Additional research focusing on primary and specialized healthcare access during outbreaks for PWDs, especially with sensory and physical disabilities, is crucial to furthering health equity.

Abstract citation ID: ckae144.581
Sickness absence duration of stress complaints, adaptation disorder or burnout in the Netherlands

Angelique De Rijk

A De Rijk[1], *L Van Iperen*[1], *H De Witte*[2,3], *R Kok*[4], *W Schaufeli*[2,5]
[1]Department Social Medicine, Maastricht University, Maastricht, Netherlands
[2]Occupational & Organisational Psychology and Professional Learning, Faculty of Psychology & Educational Science, KU Leuven, Leuven, Belgium
[3]Optentia Research Unit, North-West University, Vanderbijlpark, South Africa
[4]Department Research and Business Development, Utrecht, Netherlands
[5]Department of Psychology, Utrecht University, Utrecht, Netherlands
Contact: angelique.derijk@maastrichtuniversity.nl

In the Netherlands, occupational physicians can diagnose burnout when employees report sick. Their guideline distinguishes between stress complaints lasting < 3 months, adaptation disorder with complaints lasting 3-6 months and burnout with complaints lasting > 6 months at moment of diagnosis. The Four-Dimensional Symptom Questionnaire (4DSQ) is recommended to assess and monitor. The new Burnout Assessment Tool (BAT) might be an alternative. Research questions were: 1) What are the sickness absence duration, 4DSQ and BAT-scores of absentees diagnosed with stress complaints, adaptation disorder and burnout?; 2) Is the BAT a better predictor of sickness absence duration than the 4DSQ? From 2020-2023, data was collected among all 3,462 employees who were absent due to stress complaints, adaptation disorder or burnout at one large occupational health and safety service via registry data and an employee questionnaire. Results show that two-thirds of those with stress complaints, half of them with adaptation disorder and one third with burnout were absent for less than half a year. 4DSQ and BAT scores differed significantly between the three groups ($p<.05$). The BAT explained 0.8% of variance in absence duration ($p< .001$) when controlled for covariates, which explained 1.6% of variance ($p< .001$). The explanation by BAT was 1.9% within the group with stress complaints ($p = 0.002$), .4% within the group with adaptation disorder ($p=.022$) and absent within the group with burnout. Comparable results were found for the 4DSQ. The differences in absence duration between the three groups aligned with the Dutch guidelines. The BAT nor the 4DSQ were clinically relevant predictors of duration of absence for stress-related diagnoses among absentees in the Netherlands. To reduce productivity loss, it seems better to report sick when still in the stage of stress complaints than to wait until a full burnout has developed. The BAT and 4DSQ might help risk assessment in the working population.

Key messages:

- The sickness absence duration of Dutch employees diagnosed with burnout is much longer than that of those with adaptation disorder or stress complaints.
- Both the instrument recommended in the guideline and the new instrument have no clinical relevance in predicting sickness absence duration of stress-related diagnoses.

Risk of death after type of intimate partner violence (IPV) involvement

Marcelo Urquia

M Urquia[1], *B Trask*[2], *N Scatliff*[2], *W Au*[1]
[1]Manitoba Centre for Health Policy, University of Manitoba, Winnipeg, Canada
[2]Faculty of Law, University of Manitoba, Winnipeg, Canada
Contact: marcelo.urquia@umanitoba.ca

Background: Most studies have focused on women's intimate partner violence (IPV) victimization but perpetration and bi-directional violence remain understudied.

Methods: Using linked criminal justice and population registers in Manitoba, Canada, we assessed the risk of death according to the role in IPV incidents (accused-only, victim-only, bidirectional, none). In this retrospective matched cohort study, we assembled a cohort of 212,068 adults who were followed from April 2004 to March 2023 to assess IPV incidents and subsequent death. Those involved in an IPV incident were 1:3 matched to persons with no history of IPV based on birth year, sex and marital status at the time of the incident.

Results: Men comprised 85% of accused-only, 21% of victim-only, and 50-51% in the other two groups. Overall, compared to those without IPV involvement, the adjusted Hazard Ratios for all-cause mortality were 1.38 [95% Confidence Intervals (CI): 1.28, 1.49] for accused-only, 1.39 (1.29, 1.50) for victim-only and 1.45 (1.19, 1.77) for bidirectional IPV. The associations were stronger among women, particularly that of bidirectional violence [1.24 (0.97, 1.60) among men and 1.92 (1.39, 2.66) among women]. Similar patterns were found for intentional mortality [0.96 (0.56, 1.64) among men and 2.43 (1.27, 4.65) among women].

Conclusions: There are clear sex inequities in IPV involvement. Any type IPV involvement is associated with higher risk of death, particularly among women, who comprise most of the victims.

Key messages:

- Any type IPV involvement is associated with higher risk of death, particularly among women, who comprise most of the victim.
- Use of linked criminal justice data allows studying the consequences of IPV victimization, perpetration and bidirectional violence and monitor gender inequities over time.

Abstract citation ID: ckae144.583

Facilitating subgroup identification: the use of decision trees in breast cancer screening uptake

Núria Pedrós Barnils

N Pedrós Barnils[1,2], *B Schüz*[1,2]
[1]Prevention and Health Promotion, Bremen University, Bremen, Germany
[2]Leibniz ScienceCampus Digital Public Health, Bremen, Germany
Contact: nupedros@uni-bremen.de

Introduction: Organized breast cancer screening (BCS) programs are effective prevention measures for women aged 50-69 to prevent the sixth cause of death in Germany. It is unclear which sociodemographic factors and potential interactions are associated with never-attendance. Explorative approaches such as decision trees offer an inductive approach to intersectional subgroup identification based on different computational decisions. This study discusses two approaches for estimating the likelihood of not attending BCS in Germany.

Methods: Women aged 50-69 ($N = 3{,}644$) were selected from the German 2020 European Health Interview Survey. We estimate the risk of not attending BCS first by employing cross-classification regression analysis utilising known social dimensions and second by leveraging the nodes of the best-performing decision tree as exposure variables.

Results: The first approach, adjusting for age, found that women born in Germany had 1.97 higher odds ($p = 0.015$) of never attending BCS than high-income women not born in Germany. Conditional Inference Tree (mincriterion= 0.6040046, maxdepth=3) adjusted to optimise sensitivity and the Area Under the Curve (71.43% sensitivity, 63.21% AUC), identified 8 relevant intersectional groups characterised by unique combinations of family status, perceived social support, working situation, experienced physical limitation, and region, with the highest odds of 4.85 ($p < 0.001$) of not attending BCS for women living with their couple and children or non-conventional household constellations who perceived little, uncertain or a lot of social support.

Conclusions: Using explorative decision trees for subgroup identification, the study provides more detailed insights into women at higher risk of not attending BCS in Germany, aiding, on the one hand, more precise health reporting data and, on the other hand, enhanced preventive public health interventions.

Key messages:

- Explorative decision trees for subgroup identification allow for more detailed insights into women at higher risk of not attending BCS in Germany for enhanced preventive public health interventions.
- Women living with their couple and children or non-conventional constellations who perceived little, uncertain or a lot of social support are at the highest odds of never attending BCS in Germany.

Abstract citation ID: ckae144.584

COVID-19 impact on childhood vaccination attitudes in pregnant antenatal class attendants in Rome

Stefania Bruno

S Bruno[1,2], *L Nachira*[1], *P Arcaro*[1], *E Campo*[1], *F Pattavina*[2], *D Pascucci*[3], *G Damiani*[1,2], *B Carducci*[2], *A Lanzone*[2], *P Laurenti*[1,2]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Women, Children Public Health Sciences Department, Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
[3]Health Management, Fondazione Policlinico Universitario Agostino Gemelli IRCCS, Rome, Italy
Contact: stefania.bruno@unicatt.it

Background: The COVID-19 pandemic caused a decrease in vaccination rates, impacting vulnerable populations such as pregnant women (PW), who concern about future children's immunisations. The aim of this study was to assess whether the pandemic led to changes in childhood vaccination attitudes among PW attending antenatal classes at the Fondazione Policlinico Universitario A. Gemelli in Rome. Specifically, it assessed the impact of the pandemic on the perceived usefulness of information sources, their trust in healthcare workers (HCWs) and the National Health Service (NHS), their perception of the risk of infection and severity of vaccine-preventable diseases (VPDs), and their vaccination intentions.

Methods: A repeated cross-sectional study was conducted across three flu seasons by administering an anonymous questionnaire: one before and two during the pandemic. Intention to vaccinate children was expressed as the percentage of PW who selected each vaccination from the questionnaire. Trust in HCWs and the NHS, and perception of the risk of infection and severity of VPDs were expressed as the percentage of PW who answered "quite" or "very". For the usefulness of information sources, mean scores were calculated. To assess differences of the three periods a chi-square test was performed ($p = 0.05$).

Results: Course attendance surged from 105 to 340. Significant shifts in vaccination intentions were noted: 7.5% and 10% decreases for measles ($p = 0.02$) and pertussis ($p = 0.004$), respectively, from 2019-20 to 2020-21. Perceived contagion risk decreased, but perceived disease severity increased. A significant reduction in the proportion of PW suspecting economic interest behind NHS workers promoting vaccination, and an increase in the perceived usefulness of non-institutional websites and of the advice from non-NHS physicians were noted.

Conclusions: PW's attitudes towards vaccinations might have been modified by COVID-19 pandemic, regarding risk perception and trust in NHS HCWs.

Key messages:

- Our findings suggests that PW's attitudes towards childhood vaccinations might be modified by the COVID-19 pandemic, in particular risk perception and trust in NHS healthcare workers.
- These findings could help Public Health to develop evidence-based interventions and communication strategies, to maintain vaccine confidence and mitigate potential adverse effects.

Abstract citation ID: ckae144.585

Fighting HAIs by monitoring hand hygiene compliance in the Umberto I teaching Hospital in Rome

Mariateresa Ceparano

M Ceparano[1], A Covelli[1], V Baccolini[1], G Migliara[2], G Carluccio[1], D Mattera[1], C De Vito[1], M De Giusti[1], C Marzuillo[1], P Villari[1]
[1]Dipartimento di Sanità Pubblica e Malattie Infettive, Sapienza, Rome, Italy
[2]Department of Life Sciences, Health and Health Professions, Link Campus, Rome, Italy
Contact: mariateresa.ceparano@uniroma1.it

Background: Healthcare-associated infections (HAIs) are one of the most common preventable complications in hospitalised patients related to increased morbidity and mortality for patients. Proper hand hygiene (HH) can decrease the prevalence of HAIs within care settings. The aim of the study was to evaluate the effects of a monitoring and feedback system on HH compliance (HHC).

Methods: Three monitoring and feedback studies have been carried out in Umberto I teaching hospital of Rome since 2021. Healthcare workers (HCWs), were trained on how to carry out the direct observation on the 5 WHO moments on HH. The data collection lasted two weeks each year. Following data collection, they were analysed and discussed annually with HCWs. A multivariable logistic regression model was constructed to identify predictors of HH compliance.

Results: A total of 15874 HH were observed, of which 40.1% in 2023. The recorded HHC was 71.0% in 2021, 75.4% in 2022 and 71.6% in 2023. Multivariable analyses showed that HHC was positively associated with female sex of observed (aOR:1.3, 95% CI:1.1-1.4), during weekend days or holidays (aOR:1.3 95% CI:1.1-1.4) and all indications with respect to 'before touching a patient'. Regarding the professional category of the observer, compared to physicians, midwives were more likely to report compliant observations (aOR=2.4, 95% CI: 1.4-4.1). On the other hand, a negative association was found with external ward staff and other HCWs and no-HCWs compared to physicians. Ward area and year of observation did not influence the probability of the outcome.

Conclusions: The results of this study revealed sub-optimal adherence to HH, with the lowest rates observed prior to patient interaction. That, coupled with the variability seen among HCWs, underlines the difficulties in achieving a uniform level of compliance. Therefore, ongoing training to raise awareness among HCWs and to repeat the survey over time identifying any major problems is essential.

Key messages:

- Monitoring the reasons for non-adherence to hand hygiene in healthcare institutions in order to formulate strategies to improve HH adherence among hospital staff is essential.
- Hand hygiene (HH) monitoring systems can produce measurable improvements in HH adherence by healthcare personnel, resulting in a reduction in the incidence of healthcare-associated infections.

Abstract citation ID: ckae144.586

Signal detection and assessment supporting syndromic surveillance during the UEFA EURO 2024

Madlen Schranz

M Schranz[1], J Estupinan Mendez[1], C Schlump[1], I Markus[1], H Heese[1], N Charfeddine[1], M Diercke[1], A Ullrich[1]
[1]Infectious Disease Epidemiology, Robert Koch Institute, Berlin, Germany
Contact: schranzm@rki.de

Background: Mass gatherings like the UEFA European Football Championship in Germany pose a challenge for public health, elevating the risk of infectious disease outbreaks. The Robert Koch Institute (RKI) is performing intensified surveillance during this event, including data from emergency departments (ED). So far, no standardised process for signal detection, their assessment and communication exists for ED surveillance.

Methods: We reviewed the literature to identify an appropriate signal detection method for ED surveillance. We tested different aggregation levels of the ED data, to ensure sufficient quality with sparse categories. After consulting with international experts, we defined a standardized process for signal assessment. We developed an interactive dashboard to investigate anomalies by further analysing the ED data.

Results: We used the Farrington Flexible algorithm, but expanded its functionality to perform daily instead of weekly monitoring. Aggregating to federal state level or in five age categories provided enough daily data for the algorithm. During the assessment, identified signals will be automatically scored based on pre-defined criteria (e.g. excess number of cases, reoccurrence in previous days). Signals with a high score will be forwarded to an epidemiological assessment, where they are manually evaluated based on standardised questions (e.g. expected seasonality, disease severity). Surveillance experts at RKI discuss them further and decide the course of communication and possible further measures. We developed an interactive dashboard in which signal detection and assessment is visualized.

Conclusions: Syndromic surveillance using ED data is used as an information source for early warning during a mass sporting event in Germany. Signal detection enables the identification of potential outbreaks, while the standardized assessment process ensures an efficient way to prioritize and steer communication efforts across public health services.

Key messages:

- Syndromic surveillance using signal detection has previously proven valuable to detect potential outbreaks of infectious diseases during mass gatherings.
- A standardised signal assessment process including an automatic and manual component ensures a sustainable and efficient way to prioritize possible incidents and steer public health communication.

Abstract citation ID: ckae144.587
Parental childhood vaccine hesitancy and the National Vaccination Programme, in Portugal

Filipa Gomes

F Gomes[1,2], *P Soares*[1,3,4], *AR Goes*[1,3], *AJ Santos*[5]
[1]NOVA National School of Public Health, NOVA University Lisbon, Lisbon, Portugal
[2]Public Health Unit, Local Health Unit of Loures-Odivelas, Loures, Portugal
[3]Comprehensive Health Research Center, NOVA University Lisbon, Lisbon, Portugal
[4]National Institute of Health Dr. Ricardo Jorge, Lisbon, Portugal
[5]CINTESIS@RISE, University of Aveiro, Aveiro, Portugal
Contact: filipagomes291@gmail.com

Background: Despite the invaluable contribution of vaccination to Public Health, vaccine hesitancy is increasing in the European Union. Several factors are associated with parental childhood vaccine hesitancy (PCVH). In Portugal, there are no known studies specifically addressing vaccine delay in infants.

Objectives: We aimed to estimate the proportion of parental childhood vaccine hesitancy (PCVH) up to 12 months of age in Portugal, and to determine vaccination (confidence and information) and National Vaccination Programme (NVP) associated factors.

Methods: We performed a cross-sectional study on a convenience sample, using an anonymous online questionnaire directed to parents of children up to 17 months old, living in Portugal. We performed an exploratory factor analysis, followed by logistic regression. We obtained crude (OR) and parental vaccination status' adjusted odds ratios (aOR).

Results: PCVH proportion was estimated at 1.8% (95%CI: 1.0%-3.0%; n = 790). The exploratory factor analysis resulted in five dimensions: 1. vaccine confidence; 2. access to enough/reliable information about vaccines; 3. access to NVP; 4. vaccination schedule; 5. trust in healthcare professionals' information about vaccines. Vaccine confidence (aOR=0.29, 95%CI: 0.14-0.54), vaccination schedule (aOR=0.31, 95%CI: 0.15-0.58) and trust in information about vaccines provided by health professionals (aOR=0.30, 95%CI: 0.16-0.53) were protective dimensions of PCVH.

Conclusions: The low proportion of PCVH observed is consistent with the high immunisation coverage in Portugal. Vaccination schedule, trust in vaccines, and in the information provided by healthcare professionals are factors associated with lower vaccine hesitancy. This highlights the importance of trust and healthcare professionals in maintaining high vaccination coverage in Portugal.

Key messages:

- Parental childhood vaccine hesitancy (PCVH) proportion was 1.8%. Vaccine confidence, vaccination schedule and trust in information provided by health professionals were protective factors of PCVH.
- Trust in vaccines and in healthcare professionals seem to play a key role in keeping a high immunisation coverage in Portugal.

Abstract citation ID: ckae144.588
Quantifying Cardiovascular Disease Burden and Quality of Care Index across Four Visegrád Countries

Mohammed Merzah

M Merzah[1], *S Fiatal*[1], *J Sándor*[1]
[1]Department of Public Health and Epidemiology, University of Debrecen, Debrecen, Hungary
Contact: Merzah.karbala@gmail.com

Background: Cardiovascular diseases (CVDs) have surged to become the leading cause of premature death in Europe. Yet, analyses examining the Quality of Care Index (QCI) and CVD burden within the 4-Visegrád (4V) nations remain notably sparse. This study aims to address this gap by comprehensively assessing both the QCI and CVDs burden across these countries.

Methods: The burden of CVDs was assessed using data extracted from the GBD-study 2019. We employed min-max normalization to standardize each health indicator, including Mortality-to-Incidence Rate, Prevalence-to-Incidence Rate, Disability-Adjusted Life Years-to-Prevalence rate, and Years of Life Lost-to-Years Lived with Disability. Subsequently, we utilized a weighted sum approach to aggregate the normalized values of the health indicators. The QCI was then derived as the sum of the products of normalized values and their corresponding weights.

Results: In 2019, age-standardized rates (per 100,000) significantly decreased compared to those in 1990. Ischemic heart disease remained the primary cause of death in all 4V countries, followed by stroke. Czechia exhibited the most substantial reduction in 2019 compared to the rates in 1990, with incidence and mortality rates decreasing by -252.55 and -308.95, respectively. Poland demonstrated the highest reduction, compared to the Central European average rates, in both incidence (-113.73; 95% CI: -125.08_-103.79) and death rates (-74.79; 95% CI: -73.53_-75.31) in 1990, and in 2019 (-175.22; 95% CI: -169.52_-178.29 and -41.55; 95% CI: -40.12_-40.64, respectively). Poland scored highest in QCI among the 4V countries, with Czechia scoring the lowest.

Conclusions: The findings underscore the imperative for continued efforts to boost cardiovascular healthcare and outcomes in the region. While the reduced ratio signals improvement, there remain avenues for refining disease management, prevention strategies, and access to care to further enhance patient outcomes.

Key messages:

- Our study on 4V nations' QCI and CVD burden underscores urgent need for sustained efforts in cardiovascular healthcare, with notable rate reductions since 1990.
- Challenges persist in managing heart disease and stroke in the 4-Visegrád (4V) countries.

Contact: eva.legendre-ext@ars.sante.fr

Social inequalities in health affect access to healthcare and prevention. In Marseille, these inequalities are pronounced, with 26% of the population below the poverty line. In September 2022, a health mediation and outreach program was launched in deprived neighbourhoods to promote cancer screening and vaccination by going towards populations and providing information and orientation adapted to individuals' health literacy and autonomy. We aimed to evaluate the effectiveness of this intervention. A repeated cross-sectional study compared knowledge, attitudes and practices about cancer screening and vaccination before and after health mediation interventions and between control and intervention neighbourhoods. Trained investigators administered a questionnaire door-to-door to individuals aged 18-74 years in randomly selected households. A first T0 survey was conducted in September 2022, and a second T1 survey is underway in May 2024, in 13 intervention and 26 control neighbourhoods. We compared the before-and-after participation rates and associated risk factors for cancer screening and vaccination between both areas using mixed regression models. Of the 2,647 respondents at T0, 61% were women, 43% non-native French speakers, 40% unemployed, and 53% had public health insurance. Survey respondents were socially deprived and had lower participation rates in cancer screening and vaccination compared to national levels. At T0, the cancer screening participation rate was 31% for colorectal cancer, 51% for breast cancer, and 68% for cervical cancer. Factors associated with non-participation were not believing in the effectiveness of cancer screening, not being aware of its existence or not speaking French. At T0, only 54% knew about human papillomavirus vaccine and only 35% of eligible women were vaccinated. A comparison of these T0 results with results of the ongoing T1 survey will be presented, in order to assess the effectiveness of this health mediation intervention.

Key messages:

- Health mediation promotes cancer screening and vaccination by going towards populations in deprived neighbourhoods and providing information adapted to individuals' health literacy and autonomy.
- Survey respondents were socially deprived and had lower participation rates in cancer screening and vaccination compared to national levels.

Abstract citation ID: ckae144.590

The role of interoception in lifestyle factors: a systematic review

Jesper Mulder

J Mulder[1,2], M Boelens[1], LA Van der Velde[1], M Brust[1], JC Kiefte-de Jong[1]
[1]Public Health and Primary Care, Leiden University Medical Center, Den Haag, Netherlands
[2]Human Movement Sciences, University of Groningen, Groningen, Netherlands
Contact: j.mulder6@lumc.nl

Interoception, the perception of the internal state of the body, has been shown to play an important role in various conditions. A clear overview of the relationship between interoception and lifestyle factors has to the best of our knowledge not yet been presented. This systematic review aims to provide insight into the current state of evidence about the role of interoception in lifestyle factors. A protocol for this systematic review was registered in PROSPERO (CRD42023465957). A systematic search conducted in PubMed, Embase, and Web of Science databases included terms such as interoception (accuracy, attention, awareness, sensitivity, or sensibility), as well as lifestyle factors (alcohol consumption, cognitive leisure and relaxation activities, eating behavior, exercise, sleep, or smoking). Studies written in English, using qualitative data, including adults, using at least one measure of interoception, and using at least on measure of a lifestyle factor were included. The review included 68 studies, in which 47 measures of interoceptive accuracy and 34 measures of interoceptive attention were identified. Six studies quantified interoceptive awareness (e.g., the interaction between interoceptive accuracy and attention). 12 studies focused on alcohol consumption, 22 studies on cognitive leisure and relaxation activities, 19 studies on eating behavior, 9 studies on exercise, 4 studies on sleep, and 5 studies on smoking. Generally, cognitive leisure and relaxation activities, eating behavior, and fasting showed positive relations with interoception. Conflicting evidence on the relation between exercise and some interoceptive domains, and moderate evidence on the positive relation with other interoceptive domains was found. Greater sleep difficulties were related to enhanced interoception scores and alcohol consumption was negatively related with interoception, while results on the relation between interoception and smoking behavior showed varying results.

Key messages:

- Some lifestyle factors positively influence interoception and vice versa, while for other factors the results are varying or conflicting.
- The role of interoceptive skills in lifestyle factors is important for lifestyle and health management.

Abstract citation ID: ckae144.591

Active offer of influenza vaccination during hospitalization: a multicenter study in Sicily (Italy)

Alessandra Fallucca

A Fallucca[1], D Anzà[2], A Pieri[1], C Costantino[1], C Genovese[3], R Squeri[3], A Casuccio[1], F Vitale[1], F Belbruno[2], V Restivo[2,4]
[1]Igiene e Medicina Preventiva, Università degli Studi di Palermo, Palermo, Italy
[2]Provincial Healthcare Company, Prevention Department, Enna, Italy
[3]Hygiene and Preventive Medicine, Università degli Studi di Messina, Messina, Italy
[4]Faculty of Medicine and Surgery, Kore University, Enna, Italy
Contact: alex.fallucca@gmail.com

Background: Every cold season, the Italian health institutions strongly recommend influenza vaccination for categories at risk of complications, however influenza vaccination coverage is over and over far from the desirable target of 95%. After the pilot experience conducted in Palermo during the 2022-23 influenza season, the 'Vaccinations in the ward' project was extended to other Sicilian centers in order to evaluate the impact of the vaccination offer strategy in a broader territorial reality and to analyze the determinants of influenza vaccine acceptance among at risk people.

Methods: The project was conducted at the Umberto I Hospital in Enna and the University Hospitals of Messina and Palermo during the 2023-24 influenza season. A questionnaire was administered to the at risk hospitalized patients to investigate socio-demographic factors, behavioral habits, and clinical condition. Furthermore, influenza vaccination upon discharge was offered. Multivariable logistic regression was performed to identify the determinants of influenza vaccine acceptance.

Results: Overall, 374 patients with a median age of 65 years (IQR: 50-70) were recruited, of whom 36% had been vaccinated for influenza during the 2022-23 season ($n = 136$). The patients who accepted influenza vaccination in the ward were 57% ($n = 214$). The determinants of vaccination adherence were: age (OR: 1.03; $p = 0.003$); having quit smoking (OR: 2.68; $p = 0.017$); having received advice on vaccination from general practitioner (OR: 4.9; $p < 0.001$) and hospital healthcare workers (OR: 7.3; $p < 0.001$).

Conclusions: The offer of vaccination in the ward effectively increased influenza coverage among categories at risk of complications. Furthermore, the adoption of correct behavioral habits and the promotion of influenza vaccination by healthcare personnel have played a decisive role in the vaccine acceptance process. These findings could be useful for planning future influenza vaccination campaigns targeted to at risk people.

Key messages:

- Vaccination strategies are needed to increase influenza coverage among at-risk categories. Active offer of influenza vaccine upon discharge can effectively increase vaccination compliance.
- The adoption of correct behavioral habits and the promotion of vaccination by healthcare personnel play a decisive role in the influenza vaccine acceptance process among at risk people.

Abstract citation ID: ckae144.592

Multiple behavioural risk factors and mental health complaints among adults in Estonia

Galina Opikova

G Opikova[1,2]*, R Reile*[2]*, K Konstabel*[3]*, K Kask*[1]
[1]Institute of Natural Sciences and Health, Tallinn University, Tallinn, Estonia
[2]Department of Epidemiology and Biostatistics, National Institute for Health Development, Tallinn, Estonia
[3]Department of Chronic Diseases, National Institute for Health Development, Tallinn, Estonia
Contact: galina.opikova@tai.ee

Background: Behavioural risk factors are inter-related and often coincide, resulting in potentially worse mental health outcomes. This study explores the association between multiple behavioural risk factors and mental health among adults in Estonia.

Methods: We used nationally representative survey data from 2020 ($n = 6404$) to study the co-occurrence of lifestyle risk factors (smoking, alcohol consumption, physical inactivity, unhealthy diet, drug use, and high screen time) in relation to mental health indicators. Latent class analysis (LCA) was used to identify lifestyle risk profiles, while regression analysis was used to examine associations.

Results: Mental health outcomes were more frequent among females and younger respondents, but 54.4% of respondents reported having at least one mental health problem. Using LCA, three lifestyle classes were identified: multiple risk factors (17.9% of respondents), healthy lifestyle (76.1%), and drug use lifestyle (5.9%). Compared to individuals in healthy lifestyle class, respondents in multiple risk factors had higher odds for experiencing depressiveness (OR 1.46; CI 1.24-1.72), stress (OR 1.26; CI 1.06-1.49), and suicidal thoughts (OR 1.50; CI 1.26-1.80), as well as self-reported diagnoses of depression and insomnia, and using medications, such as antidepressants, hypnotics and sedatives. Respondents in drug use lifestyle had 1.5-2.5 times higher odds for all mental health items compared to healthy lifestyle class with largest difference found for suicidal thoughts (OR 2.46; CI 1.92-3.16) and medication use (OR 2.58; CI 1.91-3.47).

Conclusions: The current data highlights the importance of preventive measures targeting multiple behavioural risk factors, given that these factors often coincide. Moreover, the study showed a high proportion of individuals with at least one mental health problem, highlighting the necessity to continue efforts in preventive and interventive methods.

Key messages:

- The study highlights the significant association between multiple behavioural risk factors and mental health outcomes.
- The study also emphasizes the importance of focused interventions targeting multiple behavioural risk factors to address the increased risk of mental health problems.

Abstract citation ID: ckae144.593

Forecasting cognitive functioning: an artificial intelligence approach with Dynamic Bayesian Networks

Antti Etholén

A Etholén[1]*, T Roos*[2]*, M Hänninen*[1]*, I Bouri*[2]*, J Kulmala*[3]*, O Rahkonen*[1]*,*
A Kouvonen[4]*, T Lallukka*[1]
[1]Department of Public Health, University of Helsinki, Helsinki, Finland
[2]Department of Computer Science, University of Helsinki, Helsinki, Finland
[3]Faculty of Social Sciences, Health Sciences, Tampere University, Tampere, Finland
[4]Faculty of Social Sciences, University of Helsinki, Helsinki, Finland
Contact: antti.etholen@helsinki.fi

Background: Several potentially modifiable risk factors are associated with subjective cognitive decline (SCD). However, developmental patterns of these risk factors have not been used before to forecast later SCD. Practical tools for the prevention of cognitive decline are needed. We examined multifactorial trajectories of risk factors, and their associations with SCD using an artificial intelligence approach to build a score that forecasts later SCD.

Methods: Five repeated surveys (2000-2022) of the Helsinki Health Study ($n = 8960$, 79% women, aged 40-60 at Phase 1) were used to build dynamic Bayesian networks (DBN) for estimating the odds of SCD. A score-based approach was implemented for learning DBN using the quotient normalized maximum likelihood criterion. The model was used to predict SCD based on the history of consumption of fruit and vegetables, smoking, alcohol consumption, leisure-time physical activity, body mass index, and insomnia symptoms, adjusting for sociodemographic covariates.

Results: Of the participants, 31-48% reported decline in memory, learning, and concentration in 2022. Physical activity was the strongest predictor of SCD in a 5-year interval, with an odds ratio of 0.76 (95% Bayesian credible interval 0.59-0.99) for physically active compared to inactive participants. Alcohol consumption showed a U-shaped relationship with SCD. Other risk factors had minor effects.

Conclusions: A new online risk score tool was developed that enables individuals to inspect their own risk profiles, as well as explore potential targets for interventions and their estimated contributions to later SCD. Dynamic decision heatmap was presented as a communication tool to be used at healthcare consultations.

Key messages:

- Potentially modifiable health-related behaviours such as physical activity can contribute to subjective cognitive decline.
- Artificial intelligence can be applied to discover the complex interactions between risk factors and subjective cognitive decline, to support preventive healthcare at individual and population levels.

Abstract citation ID: ckae144.594

Predictors and outcomes of adolescent alcohol and drug use: a scoping review

Margaret M Brennan

MM Brennan[1], C Corrigan[1], D Mongan[2], A Doyle[2], B Galvin[2], E Nixon[3], L Zgaga[1], B Smyth[4], JH Ivers[1], N McCarthy[1]
[1]Department of Public Health and Primary Care, Trinity College Dublin, Dublin, Ireland
[2]National Drugs & Alcohol Strategies, Health Research Board, Dublin, Ireland
[3]School of Psychology, Trinity College Dublin, Dublin, Ireland
[4]Adolescent Addiction Service, Cherry Orchard Hospital, Dublin, Ireland
Contact: brennm32@tcd.ie

Background: Adolescence is a pivotal life stage marked by educational advancement, entry into the workforce and formation of lasting relationships. Globally, adolescence is also the peak period during which individuals first engage in alcohol and/or drug consumption. This scoping review aimed to summarize existing longitudinal research on factors and outcomes related to adolescent substance use to identify gaps in existing evidence.

Methods: A scoping review was conducted in accordance with the PRISMA extension for scoping reviews. A systematic literature search was conducted on PubMed. Additional studies were identified through hand-searching key reference lists and Google Scholar searches. A narrative synthesis was completed.

Results: 123 studies were included; 12 reviews and 111 cohort studies. 60% of cohort studies originated from North America, 29% Europe, 7% Australia/New Zealand, 2% South America and 2% Asia. Factors consistently associated with increased risk of ASU include male sex, increasing age, externalizing disorders, adverse childhood experiences and peer or parental substance use. Few studies considered wider community or neighbourhood factors. Early initiation and higher frequency of adolescent drug use were predictive of later-life substance use patterns, education derailment, contact with the justice system and mental health disorders.

Conclusions: The body of longitudinal evidence on adolescent substance use is rapidly expanding yet significant research gaps exist. Rising levels of cocaine use and its substantial health impacts motivate further research on all potentially important factors associated with cocaine use to guide interventions for prevention and treatment.

Key messages:

- There are important gaps in existing research on adolescent substance use.
- These include neighbourhood influences and factors associated with initiation of illicit drugs other than cannabis.

9.L. Round table: “What” and “How” for building competencies for effective policy making in and for public health

Abstract citation ID: ckae144.595

Organised by: WHO/Europe, University of Bremen (Germany)
Chair persons: Emilia Aragon De Leon (WHO/Europe)
Contact: aragondeleonm@who.int

Policymakers operating within the field of public health must regularly draw on their skills or competencies to facilitate engagement in and between policy sectors and with the public, to navigate the larger landscape of public health institutions and governance levels across the policy cycle, to generate, understand, and apply evidence for decision making, as well as to negotiate the demands of diverse stakeholders. What exactly are the competencies needed and how can they be cultivated to enhance the collective capacity of policymaking institutions? The increasing strain placed on public health systems worldwide, owing specially to challenges in population ageing, the burden of non-communicable diseases, and the exigencies introduced by pandemics, environmental disasters, and geo-political instabilities push us to expand the scope of public health. A look to the policy environs and outcomes seen within and across countries demonstrates that the quality of policy is both highly variable and exceedingly subject to the quality of public health leadership itself. These developments shed light on the need for greater investment in the development of competencies needed by policymakers to engage in effective decision making on key issues impacting population health and the resilience of public health systems. This includes efforts to strengthen the abilities of policymakers to identify problems, recognize opportunities, and put forth solutions in line with robust data and evidence, principles of public health ethics, gaps and priorities in public health needs, and in accordance with financial and political realities. The proposed roundtable will examine the state-of-the-art on policymaking competencies in public health, and how to build them by examining the barriers and opportunities. The panel will convene leading experts in the field of public health research and practice to explore:

1) the conceptual definition of competencies for policymaking at different levels of governance and across the policy cycle;
2) the strengths and limits of competency frameworks and their utility in guiding assessment and training tools, as well as policy practice;
3) the challenges associated with developing, maintaining and transferring competencies in fast-changing, multi-level policy making environments;
4) the challenges for public health experts and institutions to be trusted advisors both by policy makers and other stakeholders and the population; and
5) the opportunities to harness the unexploited power of professional networks in some countries of Europe.

Key messages:

- An enhanced research agenda and investment are needed for the development of competencies - individual and collective - for effective public health policy-making and stronger governance.
- Innovative approaches to policy-making are needed, and this requires building competencies, including leadership, for addressing the complex nature of public health.

Abstract citation ID: ckae144.596
Exploring the state-of-the-art on competencies for policymaking in public health

Lorraine Frisina

L Frisina[1], E Aragón de León[2]
[1]Research Center for Inequality and Social Policy, University of Bremen, Bremen, Germany
[2]Country Policies and Systems, WHO/Europe, Copenhagen, Denmark
Contact: frisina@uni-bremen.de

Against the complex backdrop characterizing both the nature of public health challenges and the corresponding skills required to face them, this presentation will introduce the state-of-the-art on scholarship concerned with the definition and/or development of competencies for effective policy making in public health. The presentation will focus especially on presenting findings of a scoping review of the state-of the-art involving: 1) research that develops competency frameworks explicitly designed for policymakers operating in public health; and 2) case studies that explore the application of specific competencies (whether explicitly or implicitly) in different public health contexts. By exploring both bodies of literature, the scoping review will take stock of how each study defines the concept of competencies, enumerates areas of knowledge and demonstrable skills pertaining thereto, and uses evidence to establish their significance in the field of public health leadership. The findings of the scoping review will also be brought into comparative perspective, examining whether and how the categories of existing competency frameworks correspond with one another, as well as reflect the insights of single case studies. The proposed presentation will conclude with an overview of findings of a mapping exercise including all competencies identified in the literature, which can serve the workshop audience as both a synthesis and holistic refinement on the state-of-the-art going forward. The proposed presentation will conclude with an overview of findings of a mapping exercise including all competencies identified in the literature, which can serve the workshop audience as both a synthesis and holistic refinement on the state-of-the-art going forward.

Improving physical healthcare for people experiencing mental illness: The COMITMENT project

Tobias Schiffler

T Schiffler[1], L Kainzbauer[2], C Tupy[3], L Lehner[4], M Eitenberger[5], I Grabovac[1]
[1]Department of Social and Preventive Medicine, Center for Public Health, Medical University of Vienna, Vienna, Austria
[2]HPE Vienna, Vienna, Austria
[3]IdEE Vienna, Vienna, Austria
[4]Department of Social & Cultural Anthropology, University of Vienna, Vienna, Austria
[5]Department of Political Science, University of Vienna, Vienna, Austria
Contact: tobias.schiffler@meduniwien.ac.at

Background: People experiencing mental illness (PMI) face significant challenges in accessing and using somatic healthcare services, reducing their overall life expectancy by up to 20 years. The COMITMENT project aimed to identify barriers and facilitators in accessing and using somatic healthcare services for PMI and co-design strategies that could address existing challenges.

Methods: This study employed a qualitative participatory approach, involving a "trialogic" steering group composed of a person with lived experience of mental illness, a family member and caregiver of PMI, as well as a health professional. Two co-design workshops were conducted with members of each trialogic group, based on "World Café" methodology, facilitating open discussion between and among the three perspectives. Data was gathered through participant observations and systematically collecting participants' workshop contributions, and analyzed thematically.

Results: Overall, 52 people participated in the two workshops. Findings identified six overarching themes regarding challenges in somatic healthcare access/use for PMI: (1) accessibility and facility design, (2) support and bureaucracy, (3) awareness among healthcare professionals, (4) societal awareness, (5) structural diversity of services, and (6) lack of networking abilities. Notable insights include inclusivity design requirements for healthcare facilities and the importance of integrating lived experiences of PMI into the training of healthcare professionals to reduce stigma.

Conclusions: This study underscores the critical need for systemic changes to improve somatic care for PMI. It suggests that greater awareness among healthcare professionals, coupled with more inclusive service design and enhanced networking abilities, could substantially improve the quality of healthcare for PMI. The COMITMENT project provides robust and co-designed results for social, systemic, and political reforms aimed at reducing healthcare inequity.

Key messages:
- This study shows how direct involvement of relevant stakeholders improves the design of interventions that truly meet the needs of people with mental illness regarding somatic healthcare services.
- To improve healthcare access and treatment for people experiencing mental illness, systemic social, design, educational, and political changes and adaptations are required.

Abstract citation ID: ckae144.598
Learnings from 'Everyone In' initiative in England for improving health of people facing homelessness

Neha Jain

Contact: neha.jain@newcastle.ac.uk

Issue: The COVID-19 pandemic presented an unprecedented health risk to people experiencing homelessness including risk of infection due to inability to self-isolate, and pandemic restrictions adding barriers to accessing health support. The English Government implemented the 'Everyone In' policy at the start of the COVID-

19 pandemic, which offered accommodation to those who were (or at risk of) sleeping rough. This led to integration of support for health, care and housing.

Description of the problem: Between January-October 2023, a qualitative study was undertaken to understand what worked well and less well in implementing the 'Everyone In' initiative for improving physical and mental health outcomes for people experiencing homelessness. People who were provided accommodation and those involved in the planning or delivery of the initiative were interviewed.

Results: Flexibility in provision of funding and support, lack of red tape and joined-up working between partners across sectors were key positives of implementing the policy. 'Everyone In' also led to new ways of supporting and overcoming barriers to support, for example, provision for people with no recourse to public funds. Access to health services for people experiencing homelessness was improved by strengthened relationships with service providers, and outreach within the accommodation for wrap-around support. Challenges were faced in support for substance use. Data sharing practices, mental health support, and recognition of trauma were areas that could have worked better.

Lessons: Availability of flexible and earmarked funding is crucial in implementing strategies for improving outcomes in homelessness. Many short and long-term initiatives have been launched as a result of 'Everyone In'. This study highlights the importance of partnership working, supported housing and maintaining flexible, responsive approaches to interventions to meet the health and social care needs of people experiencing homelessness.

Key messages:

- Multi-sectoral partnerships and integrating housing with health and care support can improve access to services.
- Availability of flexible funding for homelessness strategies supports adaptable and responsive service provision.

Abstract citation ID: ckae144.599
Evaluation of a public health workplace staff psychosocial risk assessment and wellbeing initiative

Lucinda Ryan

L Ryan[1], *F Cooney*[1]
[1]Department of Public Health, HSE Dublin and Midlands, Dublin, Ireland
Contact: lucindaryanmurtagh@gmail.com

Adverse psychosocial work environments can have a detrimental effect on staff wellbeing causing chronic stress leading to burnout. Despite legislation mandating regular risk assessments, only one third of workplaces assess psychosocial risks. A 2020 European report identified one of the main barriers being a reluctance to talk openly about psychosocial issues. This paper describes an evaluation of a staff psychosocial risk assessment and wellbeing initiative in a Public Health Department in Ireland. The initiative commenced in October 2022 during a period of major health service organisational change. Informed by positive organisational psychology conceptual frameworks, guided by the European Psychosocial risk assessment framework (PRIMA-EF) and utilising the HSE Work Positive (CI) survey tool it was possible to constructively identify and categorise psychosocial risks across the Public Health team. In the evaluation, a mixed methods approach was used based on Donabedian's structures, processes and outcomes overarching framework and Nielsen's Model of Process Evaluation Framework. The first three iterative quality improvement cycles of the intervention were reviewed. The evaluation demonstrated that all of Nielson's three indicators for a successful organisational level staff wellbeing intervention had been met: there was evidence of improvement in both working conditions and staff wellbeing; iterative quality improvement cycles including appreciative inquiry staff collaborative engagement ensured staff views and key learning was captured; new organisational structures within the Department enabled the sustainability of this process. The evaluation indicates that the staff psychosocial risk assessment process is beneficial for staff wellbeing and that the methods used are appropriate. The resources used in this process continue to be readily available within the health service organisation. The evaluation supports continuation of this process in its present form.

Key messages:

- This evaluation supports staff psychosocial risk assessment and mitigation processes and provides a framework for healthcare managers to implement such processes and comply with legislation.
- This evaluation indicates that effective and sustainable collaborative staff engagement can be achieved using a positive focus which builds on team strengths and harnesses collective wisdom.

[8]Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy
Contact: giansanto@mosconi.com

Suicide is a serious but preventable public health issue globally, with substantial geographical disparities. Although mortality from suicide is higher in older age groups, it ranks as the fourth leading cause of death among youth. This study analysed global suicide trends for the age group 10-24, from 1990 to 2020. Using data on certified deaths from suicide (codes ICD-9: E950-959; ICD-10: X60-X84, Y87.0) and population from the WHO mortality database for 52 countries with valid data, age-standardised suicide rates (ASR) were computed (by sex, country, and calendar year) and joinpoint regression analyses were carried out to identify significant changes in trends. High variability in suicide rates and trends was observed, with male-to-female ratios ranging from two to five. From 1990 to 2020, most European countries reported declining suicide trends, with some exceptions. Particularly concerning trends emerged in the United Kingdom, with increases of 2.5% per year among males since 2005 and 8.5% among females since 2012. Southern Europe exhibited the most favourable trends and lowest suicide rates, with 3.1/100,000 males in Italy (2020) and 3.5/100,000 males in Spain (2021), and 0.9/100,000 females in Italy (2020) and 1.1/100,000 females in Romania (2019) among females. Conversely, Central-Eastern Europe showed the highest rates, with 10.2/100,000 males in the Russian Federation (2019) and 10.0/100,000 males in Poland (2002). Non-European areas reported higher suicide rates and significant increases. The highest ASR was 15.5/100,000 males in the United States of America, with an increase of 3.8% per year among males from 2009 to 2020 and 6.7% among females from 2007 to 2017, followed by a levelling off. Youth suicide rates and trends vary widely globally. Interpretation of temporal and geographical comparisons in suicide mortality should be approached cautiously due to potential misclassification or under-reporting of suicide deaths in some countries.

Key messages:
- Albeit data on suicide mortality should be interpreted with caution, the study reveals high variability in suicide rates and trends among youths aged 10-24 across different countries worldwide.
- Timely and accurate monitoring of epidemiological trends should support the planning, implementation, and evaluation of setting-specific health promotion strategies in mental health.

9.N. Practice session: From Data to Action – Joining forces to close the inequity gap in adolescent health

Abstract citation ID: ckae144.601

Organised by: EUPHA-CAPH
Chair persons: Heiko Schmengler (Netherlands), Julia Dratva (EUPHA-CAPH)
Contact: heiko.schmengler@live.de

Persistent adolescent health inequalities exist in Europe, necessitating interventions that address both individual and societal factors, especially those pertinent to youths in unfavourable contexts. Collaborative efforts involving cross-sectoral partnerships and adolescent engagement are crucial in identifying and mitigating these disparities. Three case studies exemplify this approach.

Case study 1: Effective intervention development hinges upon the translation of epidemiological insights into tangible actions. Heiko Schmengler will discuss how individual and contextual-level data is made actionable for the development of ePro-schools, an e-health intervention to promote healthy dietary habits and physical activity amongst adolescents in socially disadvantaged settings. ePro-schools brings together stakeholders from academia, the health sector, the education system, and local communities. This collaborative approach ensures that the intervention is not only grounded in solid scientific evidence but also fits the specific cultural, social, and economic contexts of the adolescents it aims to serve.

Case study 2: Adolescents are not passive consumers of interventions, but active agents who frequently understand best what they need to improve regarding their health. Lourdes Cantarero Arevalo will share innovative methodologies and best practices for involving adolescents in data collection, intervention design, and policy development processes with the final aim to empower the voices of adolescents in vulnerable situations while addressing problems that are relevant for them.

Case study 3: Filipa Alves da Costa will draw attention to the health concerns of adolescents resulting from incarceration. This talk will outline the development of a policy brief derived from UN global study data, which highlights the importance of cross-sectoral collaboration in developing actions to safeguard access to high quality healthcare for adolescents within the criminal justice system. A cross-sectoral approach is critical given that criminal justice systems typically fall outside the direct oversight of health ministries. The goal is to encourage policymakers, practitioners, and advocates to consider inter-sectoral strategies to address the complex health challenges these adolescents face.

Following the presentations, we will facilitate a dynamic discussion with the audience, encouraging an exchange of ideas on strategies to address adolescent health inequalities from a multilevel perspective. This discussion aims to draw on the collective expertise of participants from diverse backgrounds, including practitioners, researchers, and policymakers. This dialogue aims to identify common barriers and opportunities, fostering a collaborative approach to tackling inequalities. The goal is to emerge from the workshop with a richer understanding of effective strategies that can be leveraged to close the gap in adolescent health across Europe.

Key messages:
- Health inequalities among adolescents must be tackled collaboratively across different sectors and with participation of adolescents.
- Participants will gain valuable insights on innovative solutions and effective methodologies from the case studies to inform their own efforts in addressing adolescent health inequalities.

Abstract citation ID: ckae144.602
Leveraging epidemiological data for the development of interventions to promote healthy nutrition and physical activity among adolescents from disadvantaged backgrounds

Heiko Schmengler
Department of Interdisciplinary Social Science, Utrecht University, Utrecht, Netherlands
Contact: heiko.schmengler@live.de

ePro-Schools is a public health initiative designed to promote healthy nutrition and physical activity among adolescents from socially disadvantaged backgrounds using a targeted e-health intervention to be deployed in the school context. A central theme of ePro-Schools is its robust cross-sectoral collaboration, involving stakeholders from academia, healthcare, education, and local communities. This cooperative approach not only enhances the intervention's relevance and efficacy but also ensures its cultural, social, and economic adaptability to the needs of the target population. The project embodies a truly interdisciplinary effort, integrating insights from epidemiology, behavioural science, public health, and digital technology to innovate and improve health promotion strategies. This presentation will explore how data from epidemiological studies, such as the Health Behaviour in School-aged Children (HBSC) study, are used to support the development of the ePro-Schools intervention. Utilizing high-quality epidemiological data, the project identifies key determinants of physical activity, dietary habits, and sedentary behaviour amongst adolescents growing up in low-SES contexts, allowing to craft tailored strategies to promote healthier lifestyles within this vulnerable population.

Abstract citation ID: ckae144.603
Empowering youths through citizen science to address health inequalities in adolescence

Lourdes Cantarero Arevalo
Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark
Contact: lou.cantarero@sund.ku.dk

Citizen Science (CS) stands as a beacon of hope in the fight against inequalities in adolescent health, revolutionizing scientific research by involving individuals from diverse backgrounds. Unlike traditional methods, CS transcends academic boundaries, fostering inclusivity and collaboration irrespective of age, nationality, or social status. This approach has gained momentum in adolescent health research, empowering young people as co-researchers from project inception, thereby reducing disparities in health knowledge and access. Studies demonstrate its efficacy in enhancing empowerment and health literacy among participants. YouthChronic is an example of how CS can mitigate health inequalities among adolescents. The project ensures active participation in every research stage by engaging adolescents with chronic conditions as citizen scientists. Open-ended questions facilitate detailed responses, while participation in analysis and dissemination enhances their research involvement and sense of ownership. Through initiatives like YouthChronic, CS is reshaping the research landscape, making it more relevant and impactful to bridge the inequality gap. Young Citizen Scientists' views on their participation: "As part of YouthChronic, we felt like our experiences with chronic conditions were finally being heard. The researchers were cool-they listened to us, let us be flexible with our participation, and even taught us some research skills. Learning from other peers' experiences made us feel less alone and gave us new insights. But it's frustrating that we're limited by resources. We have big ideas, like running an advocacy campaign, but we need funding to make them happen". In conclusion, by actively involving adolescents in the scientific process through CS initiatives like YouthChronic, we can reduce inequalities in adolescent health, empower marginalized voices, and pave the way for a brighter, more inclusive future in scientific exploration and discovery.

Ensuring the right to health care for detained adolescents: cross-sectoral strategies and policy innovations

Filipa Alves da Costa
Health In Prisons Programme, WHO/Europe, Copenhagen, Denmark
Contact: azevedof@who.int

This presentation will draw attention to the health concerns of adolescents deprived of liberty, stressing that incarceration of minors should be a last resort. Notwithstanding, when governments allow for incarceration of minors, they must guarantee this does not translate into deprivation of basic human rights and that international treaties are respected, including access to high quality healthcare. This talk outlines the development of a policy brief based on data from the UN global study, which identifies essential health interventions for minors in various forms of detention-migration, youth detention, and adult detention where children reside with their parents. Using case studies from Greece, India, and the United States, shortcomings in existing health systems in detention contexts are stressed. A more recent policy brief focusing exclusively on children detained in the context of migration will be used to provide good practice case studies, where appropriate actions such as changes in legislation were put in place, namely in Canada, South Africa, Ukraine and Ireland. A key focus of the presentation will be the importance of cross-ministerial collaboration, as healthcare in the criminal justice system frequently falls under the jurisdiction of ministries other than health, complicating health policy implementation. The speaker will discuss integrated approaches that involve various sectors to ensure the health rights of detained youth are addressed. The presentation aims to illuminate the systemic changes needed to protect the health of detained adolescents, urging policymakers, healthcare providers, and advocates to adopt holistic and inter-sectoral strategies. The talk will also refer to policy actions and recommendations for Member States to support them in addressing challenges so they may achieve the principles of equivalent care and continuity of care that reflects the recommendations of the United Nations Global Study on Children Deprived of Liberty.

9.O. Pitch presentations: Sexual and gender minority health

Abstract citation ID: ckae144.605

Social influence on post-drinking risky sexual behaviours: evidence in France and South Korea

Jiwon Jeong

J Jeong[1,2], *L Simmat-Durand*[1,2]
[1]Department of Social Sciences, Paris Cité University, Paris, France
[2]CERMES3, Centre for Medicine, Science, Health, Mental Health and Society, Paris, France
Contact: jiwon.jeong@etu.u-paris.fr

Background: Post-drinking risky sexual behaviours are at the conjunction of the dual risks of sexually transmitted infections and further problematic substance use, necessitating contextual analysis for determinants that promote these behaviours. This study examines the influence of social groups on post-drinking risky sexual behaviours in different cultural samples.

Methods: A cross-sectional survey was conducted among young adults aged 18-30 in France and in South Korea in 2023-2024 ($n = 998$). A construct of post-drinking risky sexual behaviours includes 3 types: having sex without condoms, having sex with occasional partners, and having transactional sex. Perceived drinking norms were measured as a proportion. Multivariate logistic regression was conducted after controlling for sociodemographic factors.

Results: Young adults who reported that their social group had a higher proportion of drinkers were more likely to engage in a wider range of post-drinking risky sexual behaviours (aOR=1.02 [95%CI 1.01-1.03] in France; 1.01 [1.01-1.03] in Korea). Young adults in social groups who had experienced two types of risky sexual behaviours were more likely to engage in risky sexual behaviours after drinking (5.13 [2.21-14.1] in France; 10.65 [5.86-19.8] in Korea), compared to young adults in social groups with no experience. Young adults in social groups who had experienced all three types of risky sexual behaviours had a 10 times higher likelihood of engaging in post-drinking risky sexual behaviours in the French sample (10.12 [3.69-31.4]) and a 16 times higher likelihood in the Korean sample (16.0 [7.31-35.8]).

Conclusions: Alcohol-related risky sexual behaviours among young adults were found to be significantly associated with their social group's drinking and risky sexual behaviours, across different cultural settings. More attention should be paid to direct/indirect influence of social groups on health risk behaviours.

Key messages:
- The influence of social groups on alcohol-related risky sexual behaviours is significant regardless of cultural setting.
- Peer and social norms-based health promotion is recommended to prevent IST and HIV/AIDS.

Abstract citation ID: ckae144.606
Teachers perspectives on positive and inclusive sex education in Dutch secondary schools

Margreet de Looze

M de Looze[1], *S Meijburg*[3], *M Vermeulen*[2], *J van Ditzhuijzen*[1]
[1]Utrecht University, Utrecht, Netherlands
[2]Rutgers Centre of Expertise on Sexual and Reproductive Health, Utrecht, Netherlands
[3]Stichting Seksueel Welzijn Nederland, Utrecht, Netherlands
Contact: m.e.delooze@uu.nl

Sex education in schools can play an important role in improving young people's sexual health. Dutch youth are often dissatisfied with the sex education they receive at school; they want more attention to discussing pleasure, consent and diversity. While there have been various calls for positive and inclusive sex education over the past decade, still very few schools provide it. This study examined teachers' perspectives on positive and inclusive sex education and documents the barriers teachers are confronted with in providing this type of sex education. Based on an online questionnaire survey of 508 sex education teachers, we examined the extent to which teachers possess the knowledge, attitudes and skills that facilitate the delivery of positive and inclusive sex education. We also held focus groups with 25 teachers from 10 schools and explored what they consider to be key barriers and best practices in teaching positive and inclusive sex education. Teachers overall have the knowledge, attitudes and skills that are needed to provide positive and inclusive sex education, but there is room for improvement, for example regarding knowledge on intersex individuals and the clitoris. Teachers experienced barriers at three levels: the personal level (e.g. personal discomfort), the classroom level (e.g., safety in the classroom) and the structural level (e.g. sex education not being part of the national curriculum; lack of time). Structural barriers seem to be at the basis of the barriers at the personal and classroom level. It is advised that positive and inclusive sex education gets a permanent place in the national curriculum. By developing concrete core objectives in the area of relationships, sexuality and diversity, for all grades, and by providing more extensive teacher training, teachers and schools will be facilitated to organize sex education in a more sustainable way.

Key messages:

- Sex education teachers in the Netherlands desire better training to provide positive and inclusive sex education in the classroom.
- Integrating sex education in the national curriculum would help teachers to address sexuality in a more sustainable way in the classroom.

Abstract citation ID: ckae144.607
Closing the Gap: Implementing Gender-Sensitive Care to Address Healthcare Disparities

Sophia Sgraja

S Sgraja[1], *J Mollenhauer*[2], *U Seeland*[3], *M Kloepfer*[4], *C Kurscheid*[2], *V Amelung*[1]
[1]Institute of Epidemiology, Social Medicine, and Health System Research, Hannover Medical School, Hannover, Germany
[2]Figus GmbH, Cologne, Germany
[3]Geschlechtersensible Medizin, Otto-von-Guericke Universität Magdeburg, Magdeburg, Germany
[4]Institut für Gendergesundheit e.V., Berlin, Germany
Contact: Sgraja.Sophia@mh-hannover.de

Background: Women still face a higher mortality rate after a heart attack compared to men, and the reasons remain unknown. The project HeartGap aims to investigate the disparity between evidence-based guidelines and the integration of Gender-Sensitive Care (GSC+) in clinical settings. By exploring healthcare providers' attitudes and knowledge on GSC+, the project seeks to develop holistic recommendations for its effective implementation.

Methods: The project HeartGap employs a mixed-methods approach, including a scoping review, qualitative focus group interviews, and quantitative surveys. The focus of this abstract will be on the qualitative survey. From June 13, 2023, to April 26, 2024, a total of 18 focus group interviews were conducted in 9 hospitals of varying sizes and levels of care in Germany. These interviews involved separate groups of 3-8 nurses or physicians to explore attitudes, knowledge including the european guidelines for cardiology and current implementation of GSC+ into clinical practice. Facilitating factors and barriers were also discussed and in which fields measures should be applied. The results were evaluated using a qualitative content analysis.

Results: The interviews revealed discrepancies in healthcare providers' awareness of GSC+ and identified both facilitating and hindering factors in its implementation. Facilitating factors included increased awareness, more evidence by considering gsc+ in research, university and professional education, support from hospital leadership and politics. Barriers included a lack of time and knowledge, other priorities and vague content on GSC+ in medical and nursing guidelines.

Conclusions: Gender-sensitive care is crucial for personalized healthcare, yet its implementation remains inconsistent in clinical practice. Targeted strategies are necessary to enhance awareness, knowledge, and guidelines and policy support for GSC+. The Identified recommendations for action are transferable throughout Europe.

Key messages:

- Gender-sensitive care is pivotal for addressing healthcare disparities but faces implementation challenges.
- Comprehensive strategies, including awareness, teaching and policy support, are indispensable for integrating gender-sensitive care into clinical practice.

Abstract citation ID: ckae144.608
Perceptions of MSM on targeted sexual healthcare about HPV vaccination: a French qualitative study

Camilla Oliveri

C Oliveri[1,2], *M Mora*[1], *B Spire*[1], *G Girard*[1], *P Verger*[2]
[1]SESSTIM, Aix-Marseille University, IRD, Inserm, Marseille, France
[2]ORS PACA, Southeastern Health Regional Observatory, Marseille, France
Contact: camilla.oliveri@inserm.fr

Background: To improve the effectiveness of public health policies, HPV vaccination campaigns target "high-risk groups", such as men who have sex with men (MSM). In France, HPV vaccination is recommended for MSM up to the age of 26, rather than 19 for the general population. It's crucial to assess the impact of such targeting policies on MSM who are eligible for HPV vaccination.

Methods: A qualitative study was conducted between April and July 2022 among MSM participating in the "Vaccigay" electronic survey in France (Brosset et al. 2023). Participants were selected based on age and declared HPV vaccination status. Semi-structured interviews were conducted by telephone using a thematic grid on the barriers and facilitators influencing the uptake of the vaccine against HPV. The interviews lasted on average 40 minutes. The audio-recorded verbatims were transcribed and thematically analysed using NVivo software.

Results: A total of 22 viewpoints were analysed. Two opinions emerged without differences in terms of individuals' profile. The reasons MSM advocated for targeted sexual healthcare stemmed from the recognition of epidemiological factors, as well as the need for greater listening and understanding from healthcare workers. MSM who didn't support targeted sexual healthcare did so because they felt stigmatised and because sexual orientation might not always be clear. Among them, some advocated for sexual healthcare based on sexual practices rather than sexual orientation. Others emphasized the necessity of extending prevention tools for sexual risks existing for MSM to the general population.

Conclusions: The findings of this study prompt reflection on universal versus targeted public health policies, as well as sexual and gender discrimination within the healthcare system. We recommend improving healthcare workers' education on sexual healthcare, and that HPV vaccination guidelines could be extended to all adults up to 26, regardless of their sexual orientation.

Key messages:

- Improving knowledge among healthcare workers and MSM about HPV and sexual health is important.
- It is important to extend the age for the HPV vaccination, regardless of sexual orientation.

Abstract citation ID: ckae144.609
Systematic review of ethical/methodological issues in transgender youth participative research

Julie Servais

J Servais[1], B Vanhoutte[2], H Maddy[3], I Godin[1]
[1]Approches Sociales de la Santé, Ecole de Santé Publique ULB, Brussels, Belgium
[2]Epidemiology and Statistics, Ecole de Santé Publique, Brussels, Belgium
[3]Faculty of Medicine, Université Libre de Bruxelles, Brussels, Belgium
Contact: julie.servais@ulb.be

Background: Understanding the experiences of transgender and gender-diverse (TGD) youth is essential for developing appropriate support services. However, studies focusing on TGD youth under 18 outside clinical settings are scarce, limiting effective support development. The requirement for parental consent in participatory research poses ethical and logistical challenges, impacting the safety, well-being, and privacy of adolescent participants. This dynamic complicates the balance between adolescents' rights to autonomy and privacy and parental duties to protect their children. This review aims to illuminate the ethical and methodological challenges in participatory research with TGD youth.

Methods: A systematic review of bibliometric databases from 2006 to 2022 was conducted, focusing on transgender and gender nonconforming identities, adolescence, qualitative and participatory research methods, and consent issues. This review was registered with PROSPERO in November 2022 (CRD42022368360).

Results: Of 3,794 articles initially identified, 291 met the inclusion criteria, and 48 were extensively reviewed. Research with TGD youth commonly faces ethical tensions including parental inclusion in the consent process, safeguarding participant safety and privacy, ensuring confidentiality, and creating environments that allow TGD youth to express themselves and feel empowered. Methodological challenges include engaging public and stakeholders, recruiting participants, data collection, and maintaining research integrity.

Conclusion & Implications: The literature on participatory research with young transgender and gender-diverse individuals reveals intricate and often conflicting issues related to consent procedures, power dynamics, and the researcher's role. These findings are applicable in various legal and geographical contexts, providing insights that can guide practices globally.

Key messages:

- Research reveals ethical dilemmas in participatory research with transgender young people, highlighting difficulties around consent and the need for tailored support.
- Understanding the complexities of research ethics enables better support for transgender and gender-diverse young people during research.

Abstract citation ID: ckae144.610
Drug-facilitated sexual assault: An observational retrospective study in Barcelona (2018-2022)

Aina Camps

A Camps[1], Ll García-Esteve[2], E Salgado[2], T Echevarría[3], MJ Bertran[1]
[1]Preventive Medicine and Epidemiology, Hospital Clínic de Barcelona, Barcelona, Spain
[2]Sexist Violence and Health, Hospital Clínic de Barcelona, Barcelona, Spain
[3]Medical Toxicology Unit, Emergency Department, Hospital Clínic de Barcelona, Barcelona, Spain
Contact: ainacampsclaramunt@gmail.com

Background: Barcelona handles 400 to 500 sexual assaults yearly. Substance use is expected in one-third of reported assaults, being alcohol and cocaine the most detected substances. Nevertheless, there is a lack of updated information with reliable, recent, and context-specific data.

Methods: Retrospective observational study in people attended at the reference hospital for sexual assault care in Barcelona (H.Clinic) within 24 hours of the drug facilitated sexual assault (DFSA) in the period 2018-2022. Univariate and bivariate analysis have been carried out to describe the characteristics of the victims and identify possible associations with the assault settings, relationship with the aggressor and substances involved.

Results: Among 682 cases of DFSA, women represent 85%. Most incidents (73%) occur in the 18 to 35 age group, primarily in homes (42%), public spaces (23%), and nightlife establishments (15%). Spanish nationality is most common in both sexes (50%), yet Latin American men are prominent in drug-involved cases compared to non-Spanish European men. While alcohol (55%) and cocaine (28%) remain common, emerging drugs like GHB (15%) and MDMA (23%) are rising. The aggressor varies depending on the age and sex of the victim, with the perpetrator often being known (46%) in cases involving minor victims, while it tends to be unknown (46%) in cases involving adult victims. Chemical submission-related cases increased steadily, reaching 17% in 2022. Among these victims, 75% were women, with MDMA and cocaine being prevalent, while methamphetamine and GHB were more common among men. All these findings are statistically significant.

Conclusions: The study highlights a significant number of drug-facilitated sexual assaults mostly among young women, often occurring domestically, alongside emerging substance use trends. Adaptable surveillance systems are crucial to address these dynamic patterns and support vulnerable populations for safer environments.

Key messages:

- Drug facilitated sexual assaults are a global health issue that demands attention through a gender perspective. Substances, spaces and consumption patterns evolve over time and across generations.
- Patterns in substance use vary by age, nationality, sex, and consumption type, highlighting vulnerable population groups needing focused protection and assault prevention.

Abstract citation ID: ckae144.611
Quitting with pride: Differences in smoking behaviour across sexual identity groups in Ireland

Paul Kavanagh

P Kavanagh[1,2], A Sheridan[1], C Kelleher[2], C Noone[3], K Ward[4], F Doyle[2]
[1]HSE Tobacco Free Ireland Programme, Health Service Executive, Dublin, Ireland
[2]School of Population Health, University of Medicine and Health Sciences, RCSI, Dublin, Ireland
[3]School of Psychology, National University of Ireland, Galway, Ireland
[4]College of Population Health, University of New Mexico, Albuquerque, USA
Contact: paul.kavanagh@hse.ie

Background: As smoking prevalence reduces, smoking inequalities across population groups is emerging as a key challenge. Despite recognition of specific needs among members of the Lesbian, Gay, Bisexual, Transexual Plus (LGBT+) community, differences in smoking across sexual identity groups is uncharted in Ireland and the community is not represented in tobacco policy agenda setting. This study aimed to measure and compare the prevalence of smoking, quitting intention and quitting behaviour across sexual identify groups in Ireland.

Methods: Secondary analysis of the 2023 “Healthy Ireland” cross sectional survey of health status was conducted (n = 7,411). For the first time, this survey included a question on self-reported sexual identify, along with standard questions on smoking prevalence, quitting intention and quitting behaviour. Prevalence of smoking, quitting intention and quitting behaviour were calculated with 95% Confidence Intervals (CI) and compared across groups with Chi Square tests.

Results: In total, 2.3% (95% CI 2.0-2.7%) of respondents reported an LGB+ identity. Compared to those reporting straight identity, LGB+ respondents reported higher smoking prevalence (17.6% versus 21.4% respectively); intention to quit was similar across groups, however, LBG+ respondents also reported a higher prevalence of making at least one quit attempt in the previous 12 months (51.3% versus 78.0% respectively, $p < 0.0001$).

Conclusions: While this study highlighted tobacco-use as a health challenge for the LGB+ community in Ireland, it also identified an opportunity for tailored stop smoking approaches to support quit success. As a consequence, an innovative Fulbright-sponsored policy dialogue was convened between leaders in tobacco control, LGBT+ community leaders, health services and academia across Ireland and the USA to explore solutions, underlining the important role equity stratifiers and population surveillance play in agenda setting for public health.

Key messages:

- Including sexual identity in the national population health survey enabled tobacco-use needs across sexual identity groups in Ireland delineated for the first time.
- Equity-stratified population health surveillance informed a policy dialogue to better represent needs of LGBT+ community in public health agenda setting.

Abstract citation ID: ckae144.612

HIV risks and transactional sex among Swedish-born MSM and foreign-born MSM in Sweden

Sara Causevic

S Causevic[1], S Strömdahl[2,3], AM Ekström[2,4], T Berglund[2], K Ingemarsdotter Persson[2], M Salazar[2]

[1]Department of Public Health Sciences, Stockholm University, Stockholm, Sweden
[2]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
[3]Department of Medical Sciences, Infection Medicine, Uppsala University, Uppsala, Sweden
[4]Department of Infectious Diseases, Södersjukhuset, Stockholm, Sweden
Contact: sara.causevic@su.se

Background: Transactional sex, which includes exchanging sex for material goods, services, or money, is a key HIV risk factor. Risk patterns associated with transactional sex among men who have sex with men (MSM) in Sweden, where buying sexual services is illegal, have not been examined earlier. This study aims to assess whether transactional sex (both buying and selling), country of birth, and migration-related factors (described by country of origin) are associated with self-reported HIV status among MSM in Sweden.

Methods: We analyzed secondary data from the 2017 European MSM Internet Survey (EMIS-2017), including participants reporting to live in Sweden (n = 4443). Using multivariate logistic regression analysis, we aimed to understand factors related to involvement in transactional sex and risk of HIV acquisition.

Results: Among the respondents, 5.4% reported living with HIV, with 8.8% of foreign-born MSM and 4.8% of Swedish-born MSM. The multivariable analysis showed that both selling and buying sex in the past five years increased the odds of reporting a positive HIV serostatus among all participants. Stratifying by transactional sex exposure and country of birth showed an HIV prevalence increase for all groups. Foreign-born selling or buying sex ever in the last five years had the highest prevalence of all groups (ranging from 17.8 to 19.1%). Other factors associated with a positive HIV status were age, outness, sex with a woman in the past twelve months, and condom use.

Conclusions: The relatively high reported HIV prevalence supports the need for HIV prevention, including the scale-up of access to pre-exposure prophylaxis to foreign-born MSM. A transparent discussion about risk factors and socioeconomic structures contributing to risk behaviors, including transactional sex, is needed.

Key messages:

- Engaging in transactional sex increases the HIV risk among MSM in Sweden, particularly among foreign-born MSM.
- HIV prevention needs to address the socioeconomic factors contributing to risky behaviors, such as transactional sex.

9.P. Scientific session: National perspective on knowledge translation to bridge the gap between research and policy

Abstract citation ID: ckae144.613

Organised by: Sciensano (Belgium)
Chair persons: Robby De Pauw (Belgium), Brecht Devleesschauwer (Belgium)
Contact: robby.depauw@sciensano.be

National and international public health institutions play a crucial role in guiding public health policies. However, a key challenge in this process is to bridge the gap between the data collected and the insights required to guide decision-makers, commonly referred to as knowledge translation (KT). Various models have been proposed to facilitate the KT process in public health, and one of the widely recognized models is the Data-Information-Knowledge-Wisdom (DIKW) model, also known as the knowledge pyramid or information hierarchy. In this workshop, we provide insight into the Belgian perspective on the implementation of the DIKW pyramid, using the Belgian health status website as an example https://www.healthybelgium.be. The workshop will tackle the four distinct layers of KT, including data, information, knowledge, and wisdom. The first one involves the data collection process, and the importance of considering potential biases that may arise during this process. Information revolves around the data analysis and the translation of data into meaningful information. Knowledge builds on data-driven information by contextualizing public health analysis results.

Finally, wisdom reflects the end-result of the DIKW model, highlighting the need to utilize knowledge for action and achieving results based on the analysis performed. The DIKW model provides a valuable platform by delineating the different layers required to move from raw data to knowledge and wisdom. This process is crucial in achieving an impact on public health, where the data analyzed by public health researchers informs the end-users, including policymakers and the public. Nonetheless, the DIKW model and its applicability to knowledge translation are the subjects of many debates. Within this workshop, the national perspective of the national public health institute in Belgium, Sciensano, on each level of the DIKW pyramid will offer participants concrete examples that might spark an initial step towards their nationwide implementation of the DIKW pyramid for KT. The workshop will offer a step-by-step presentation on the different KT layers, whereby the attendees will gain unique insights into the system implemented in Belgium. This presentation will foster a discussion for generating ideas and stimulating other countries to implement the DIKW pyramid.

Key messages:

- The DIKW pyramid offers a valuable framework to guide knowledge translation in public health, which is a key task for public health institutes.
- Attendees will receive an overview and a practical example of how the DIKW-model could be applied in a national context, including a discussion of the strengths and weaknesses of the pyramid.

Abstract citation ID: ckae144.614

The data layer: the importance of sources critical appraisal

Vanessa Gorasso

Contact: Vanessa.Gorasso@sciensano.be

One of the main purposes of public health institute is to tracking the health status of its citizens and understanding its evolution over time. Given the absence of a singular, comprehensive data source, we developed a framework to select databases specific to each disease and outcome of interest. This process includes a thorough evaluation of the operational case definitions, as well as the strengths and weaknesses of each database, with a particular focus on their sensitivity and specificity. These qualities are appraised following a dedicated scoring form into different categories (i.e., high, medium, low). The selection criteria for data sources hinge on several key questions: Is the database exhaustive or merely a sample? Does the case definition rely on direct medical diagnoses or proxies? Does the source capture all cases? Is the data collected at regional or national level? Are there mechanisms for yearly or periodic updates? To establish the most accurate national prevalence estimates for each outcome, we often need to adjust for data misclassification-applying corrections for biases such as self-reported data and interpolating for missing entries. In some instances, a pooled estimate from multiple data sources is developed. A specific case will be presented to illustrate our approach in practice. This critical evaluation is pivotal, as the quality of data underpins the entire health information pyramid. The integrity of our data directly influences our ability to convert data into actionable health wisdom, ultimately affecting public health decision-making and policy formulation.

Abstract citation ID: ckae144.615

The information layer: shaping data into meaning with interactive tools

Contact: masja.schmidt@sciensano.be

Valorization and interpretation of health data are contingent upon a robust analytical framework. This framework encompasses essential processes such as data cleaning, validation, and the critical evaluation of bias and missing data. A nuanced understanding of these factors is crucial for contextualizing data through stratification, developing comprehensive analysis plans, and addressing interactions, covariates, and confounders. Such meticulous methodologies guard against 'data fishing expeditions' that could otherwise lead to erroneous conclusions. Healthybelgium.be exemplifies our approach for deciding on appropriate levels of data aggregation and stratification. This study serves as a foundation for deriving conclusions and formulating hypotheses regarding the health status of the national and various sub-populations. Our discussion will cover the limitations of the questions that can be answered with the available data, the resulting opportunities for data enhancement, and the subsequent valorization of findings for knowledge advancement. Furthermore, we will present the interactive tools (through the use of R Shiny) developed by Sciensano to disseminate information broadly, making it accessible and comprehensible to diverse audiences. These tools embody a balance of strength and limitation, facilitating an informed dialogue among stakeholders. The ongoing refinement of these tools, influenced by continuous learning and insights, exemplifies our commitment to evolving public health intelligence.

Abstract citation ID: ckae144.616

The knowledge layer: the role of key messages for translating data into meaning

Aline Scohy

Contact: aline.scohy@sciensano.be

The large volume of data generated by health information systems often remains siloed within the institutions that produce it, posing significant challenges to its reuse and interpretation. This fragmentation can result in conflicting information on critical health topics, complicating the decision-making process for policymakers. To address this issue, Belgium has initiated the 'Health Status Report' website, hosted at healthybelgium.be. This website aims to synthesize and present health data in a manner that supports evidence-based policy formulation. The website adopts a structured approach to data integration and interpretation: initially, we identify and prioritize key health topics based on their relevance and the quality of available data. Subsequently, we merge and analyze data from diverse sources to discern patterns and trends that are crucial for public health monitoring. The insights gained are then presented through both narrative texts and interactive visualizations, facilitating access and understanding for a broad audience. Crucial to this process is ongoing communication with experts and stakeholders, ensuring that the data is not only accurately interpreted but also aligns with the needs and expectations of its users. We also aim to translate the raw data into meaningful key messages by consulting with internal and external experts. This interactive platform thus serves as a critical tool for translating complex health data into actionable knowledge, enabling informed public health strategies and interventions.

Abstract citation ID: ckae144.617

The wisdom layer: how to support evidence-informed policymaking

Laura Van den Borre

L Van den Borre[1,3], V Gorasso[1,2], A Scohy[1], M Schmidt[1], B Devleesschauwer[1,4], R De Pauw[1,5]
[1]Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]Public Health and Primary Care, Ghent University, Ghent, Belgium
[3]Interface Demography, VUB, Brussels, Belgium
[4]Department of Translational Physiology, Infectiology and Public Health, Ghent University, Ghent, Belgium
[5]Rehabilitation Sciences, Ghent University, Ghent, Belgium
Contact: Laura.VandenBorre@sciensano.be

One of the returning challenges faced by public health scientists is bridging the ‘evidence-policy gap’-the disparity between identifying public health issues and implementing policies to address them. Despite the extensive literature documenting the challenges of promoting evidence-informed policymaking, opportunities for researchers to exchange experiences and learn from each other’s failures are limited. This presentation seeks to: (a) analyze key concepts in evidence-informed policymaking, based on the health information pyramid; (b) identify obstacles and facilitators in the translation of knowledge into actionable policy; and (c) present both successful and unsuccessful examples from our initiatives to influence health policy in Belgium. Specifically, we will discuss the concrete impact of the Belgian Health Status Report and the role this report plays in the development of actionable health objectives for Belgium. We will also cover the role of healthybelgium.be in governing and monitoring the health status of the Belgian population by discussing why this website has been recognized by WHO Europe as a model of good practice in evidence-informed policymaking.

9.Q. Round table: Strengthening public health law for public health professionals

Abstract citation ID: ckae144.618

Organised by: Aletta Jacobs School of Public Health (Netherlands), University of Groningen (Netherlands), EUPHA-LAW, Global Network for Academic Public Health, Faculty of Public Health (UK), ASPHER, Temple University (UK)
Chair persons: Brigit Toebes (Netherlands), Farhang Tahzib (EUPHA-ETH)
Contact: b.c.a.toebes@rug.nl

Law is a tool that public health experts can use to improve population health. Generally, law offers a range of opportunities: it can encourage healthy and safe behaviours; it can change and shape the physical and social environments; influence the social determinants of health, as well as structure the public health system. Law can also compel or restrict, and legal systems can provide accountability and oversight. ‘Public health law’ stands at the intersection of public health and law, and offers a range of powerful tools for improving health (Burris et al, 2018). While public health law is an important field for public health professionals, there is a lack of knowledge about this field, and a lack of interaction between public health professionals and law professionals. There is also a need to understand the ways law might challenge public health goals. For example, law can be used to promote goals which do not improve public health, or public health concerns can be sidelined, and law can be a tool for challenging specific public health interventions. The focus of this roundtable will be on identifying and building necessary capacities for using law by public health professionals. End-goal is to identify new initiatives to consolidate and to strengthen public health law as an important field for public health professionals. To achieve these aims, we have set three practical steps for the roundtable to embark on: 1) strengthening collaboration; 2) identifying knowledge gaps and opportunities; and 3) starting new initiatives:
1) Strengthening the collaboration and building new partnerships: we bring together experts from law and public health to identify the gaps and opportunities when it comes to implementing law by public health professionals. The roundtable will foster new collaborations and partnerships between law and public health professionals.
2) Identifying gaps and opportunities: there is a need to identify deficiencies in health policy research and how to use scientific legal research methods to overcome these problems. Relatedly, to share experiences and best practices when it comes to teaching public health law. Opportunities include the transdisciplinary model and legal epidemiology; a focus on the commercial determinants; and applying a human rights lens. Panelists - in an interaction with the audience - will identify key opportunities and discuss ways to implement them.
3) Starting new initiatives: panelists will be asked to concretize existing initiatives and discuss with the audience how they can be integrated in the field, based on our new partnerships. New collaborations will be identified. This may vary from building a new network, applying for a joint research grant or for strengthening or complementing existing teaching modules.
Altogether, this roundtable aims to strengthen our understanding of existing efforts and of the various ways in which public health expertise can be integrated in better law making.
Key messages:
- Drafting of sound laws that improve health is a joint practice of various professionals, including legal and public health professionals.
- We need to strengthen existing capacities and build new ones for using law by public health professionals.

10.A. Round table: Transforming public health systems at large scale: no pain, no gain

Abstract citation ID: ckae144.619

Organised by: WHO/Europe
Chair persons: Natasha Azzopardi Muscat (WHO/Europe), Emilia Aragon De Leon (WHO/Europe)
Contact: aragondeleonm@who.int

The COVID-19 pandemic, acceleration of climate change, and geopolitical turmoil have triggered discussions about how public health systems in Europe need to transform to be adequately equipped for the so-called "permacrisis". The challenges to policy makers, health institutions and health services have become so multifaceted, that single solutions from the health sector alone no longer work. Yet, despite the complexity, countries seek to get its own house in order whilst building on inter-sectoral and European approaches in parallel. Germany, Ireland, and Ukraine have all embarked upon ambitious public health services and institutional reforms, leading to transformative change in public health systems. WHO has been accompanying these reforms. The workshop will provide a platform to draw insights and lessons on transforming public health systems from all three countries, although their population size, their socioeconomic and political situation and their public health system design is so different. As the smallest of the three countries in population, Ireland created coherence and is aligning public health actors within "Healthy Ireland" and the Sláintecaire and the Crowe Horwath public health reforms. Germany's "Pact for the Public Health Services" has been one of the greatest public health investment programs in Europe that was initiated following lessons from the COVID-19 pandemic. And Ukraine has undertaken important legal steps to adopt a Public Health System Law, in the middle of a war of aggression on its territory. The workshop will exhibit the process of large-scale public health system transformation in each of the three countries. The purpose is to identify the enablers that make large scale system transformation possible and addressing some of the pains and gains. The workshop will have three parts. Part one consists of three presentations on large scale system reforms from each of the participating countries. Part two consists of a moderated Q&A session. Part three will focus on the synthesis of enablers for large scale public health system reforms through interaction with the workshop participants, using a digital white board.

Key messages:

- Disruptive times can create enabling conditions for large scale public health system transformation.
- Designing and implementing large scale public health system reforms is complex, requiring passion, resilience, and collaborative leadership.

Abstract citation ID: ckae144.620

Large scale system transformation: Ukraine

Nataliia Piven

In the context of the EU-Ukraine Accession agreement, Ukraine started large scale public health systems reform back in 2015. The COVID-19 pandemic tested the response capacity of the national public health system and led to some improvement during the pandemic such as on laboratory capacity. It also generated lessons for strengthening national and subnational health emergency preparedness and response. Multiple interventions, including a Joint External Evaluation led to the adoption of the Public Health System Law in 2022, laying the foundation to bolster health promotion, disease prevention, and health protection. The Ukrainian Public Health Centre was substantially strengthened, partly oriented on models in other European countries. Corresponding centers for diseases control and prevention at the oblast level were reformed and a subnational network of these centers was created. While the war has a significant impact on the public health system, infrastructure, people and more, decision makers and professionals keep working on sustaining and moving forward the achievements on public health reforms, for example with the adoption of the National Health Strategy 2030 and the adoption of the National Health Security Plan. Further legal and strategic preparations are afoot to strengthen public health services governance capacity, financing, institutional innovation and development, and public health workforce development.

The COVID-19 pandemic was a stress test for public health services in Germany. Decision making was complex (party lengthy and inconsistent) due to the divided responsibilities within the federal system. Some improvements on the public health system were already enacted during the pandemic. A "pandemic radar" was established to bundle up relevant infectious disease indicators with indicators of health services use. The national electronic notification and information system for infectious diseases was extended. Digital improvements were made in the public health offices. Laboratory capacity was strengthened, so was inter-science modelling to forecast pathogen spread. A nation-wide collaborative mechanism, the cloverleaf system, was introduced between regions to avoid the overburdening of hospitals. It is now established for times of excess need for inpatient services. In 2020, a 4 billion euros investment program, the "Pact of Public Health Services", was adopted to strengthen and modernize the German public health service institutions. The pact is implemented until 2026. The human resources component is the largest. Further priorities include digitalization, improvement of the infrastructure (of designated ports and airports) for the implementation of the International Health Regulations, research and the creation of agile and resilient public health structures. Outputs so far include the establishment of more than 4800 new public health positions, the appointment of new professorships for public health services, the initiation of several research projects, and the roll-out of more than 300 digitalization projects. A new federal institute for prevention is planned. It aims to foster networking between public health services, strengthen health communication, data use, and evidence for public health services. In this process, WHO advised the federal ministry e.g. on behavioral insights; heat health action; prevention on noncommunicable diseases and others. Many public health actors have provided opinions. However, consensus building on how Germany can overcome fragmentation in public health is ongoing.

Ireland has coped comparatively well with the COVID-19 pandemic when considering excess mortality. The reasons are likely complex and multifaceted, but it may be, in part, attributable to a comparatively young population and progress on indicators related to premature mortality and preventable mortality on chronic diseases and lifestyle risk factors. "Healthy Ireland" is a national framework in place since 2013 and utilizes a settings based approach to promote health and wellbeing in communities. It aims to improve collaboration between government, institutions, local communities, and individuals. Sláintecare is an all'party long-term health reform initiative developed in 2017 aimed at delivering the right care, at the right time, in the right place by the right team. In addition, in 2018 Ireland embarked on an ambitious public health reform programme with the implementation of the recommendations of the Crowe Horwath review of Public Health. While challenges exist, including access to services and waiting times, the governments has put in place initiatives to address these and is committed to, amongst other things, promo ting the continued integration of services across a variety of domains including primary to quaternary prevention. As Ireland began to emerge from the COVID-19 pandemic it established "The Public Health Reform Expert Advisory Group" to identify learnings from the public health components of the response, with a view towards strengthening public health and health protection generally and, specifically, future public health pandemic preparedness. The group, made up of national and international public health experts, submitted its final report in September 2023 which outlined a series of recommendations focused on potential improvements to public health policy, structures and governance. The WHO analysis of the Essential Public Health Functions provided complementary results. More work is now ahead to consider and implement these recommendations and foster institutional reforms including at the Health Services Executive, the Department of Health, and at the Health Protection Surveillance Centre.

10.B. Scientific session: The European Health Data Space (EHDS): A sea of change for health data in Europe

Abstract citation ID: ckae144.623

Organised by: DG SANTE European Commission
Chair persons: Jerome de Barros (Belgium)
Contact: jerome.de-barros@ec.europa.eu

A wealth of data is generated every day throughout our health systems which, if leveraged well, can underpin the digital solutions and policies that will transform health and care. However, the complexity and divergence of rules, structures and processes within and across European Member States make it difficult to fully harness that potential at European scale. The European Health Data Space will address this challenge by empowering Europeans to access and control their health data and by offering a harmonised and simplified framework for the reuse of health data, including for research, innovation, and policymaking purposes. During the workshop, we will present an overview of the European Health Data Space framework and its implementation phases and discuss its benefits for targeted stakeholders, including citizens, researchers and policymakers in public health.

Objectives: 1. Emphasise the importance of leveraging health data for research, innovation and policymaking; 2. Present the European Health Data Space regulation and what actions are being undertaken to prepare for its implementation; 3. Discuss how access to their health data can enable patients and individuals play an active role in their own health journey; 4. Discuss what will be the main benefits for policymakers and researchers in public health resulting from enhanced access to health data.

Introduction by Chair for presenting the European Health Data Space and the setting the scene for the session. Short presentations by speakers:

1. Implementing the EHDS: lessons from the EHDS2 pilot - Marianne Benderra, Health Data Hub, presenting his experience on developing and piloting the EHDS infrastructure for secondary use of health data, highlighting key project developments;
2. How can the EHDS enable participatory healthcare? - Henrique Martins, ISCTE, xShare project on how the xShare "Yellow Button" will empower individuals with access to and control over their health data and may foster the development of knowledge and tools necessary for prevention and management of their health;
3. What will the EHDS enable for research and policymaking? - Nienke Schutte, Scienciano, bringing the perspective of a leading European public health institute how the benefits the EHDS framework can bring for policymaking, research and innovation.

15 min Q&A session, taking questions from the audience, possibly also through Slido. Possible guiding questions: How can stakeholders contribute more broadly to the development of the EHDS? What support is needed to ensure that data users and data holders are prepared when the EHDS framework becomes operational?

Conclusions: 2 min by Chair.

10.C. Scientific session: Shifting the focus of health and economic policies: Investing in sustainable health and well-being

Abstract citation ID: ckae144.624

Organised by: Finnish Institute for Health and Welfare (Finland), Society for Social Medicine (Finland)
Chair persons: Ilmo Keskimäki (Finland), Tea Lallukka (Finland)
Contact: ilmo.keskimaki@thl.fi

The main theme of the 18th European Public Health Conference, to be held in Helsinki in 2025, is 'Investing for sustainable health and well-being.' The theme emphasizes the concept that improving population health and well-being is an investment rather than an expenditure, benefiting society as a whole and contributing to a more sustainable economy. This workshop will introduce the thematic areas of the 2025 European Public Health Conference through three presentations. First, we will highlight the approach of public health policy drawing on the economy of well-being and its application in wider societal policymaking. Second, we will explore how EU policies can contribute towards a Wellbeing Economy and how to ensure health and wellbeing remain on policy-making agendas. Third, we will present an economic case for investing in health and health systems and highlight the co-benefits it brings to other policy areas and sustainable development goals. Finally, we will discuss the future expectations for European public health policy. The workshop will conclude with a general discussion, providing the audience with an opportunity to propose topics for inclusion in the programme of the European Public Health Conference in 2025.

Key messages:

- Improving population health and well-being is an investment rather than an expenditure.
- Investing in the population's health and well-being brings co-benefits to other public policy areas.

Wellbeing Economy: Integrating Sustainability and Social Welfare

Otto Kyyrönen

O Kyyrönen[1]
[1]SOSTE Finnish Federation for Social Affairs and Health, Helsinki, Finland
Contact: otto.kyyronen@soste.fi

Wellbeing economy refers to the interconnectedness of the economy, social security, healthcare, planetary boundaries, and overall welfare, highlighting the long-run sustainability of the socioeconomic system in accordance with the UN Sustainable Development Goals. As the OECD concisely states, the wellbeing economy is meant to put people and their wellbeing at the centre of policy. In Finland, where the Ministry of Social Affairs and Health is currently rendering the concept into an official steering model for policymaking, the wellbeing economy has historically developed in relation to the Nordic welfare model, which has helped regulate demand with high efficiency. This presentation will introduce the core principles of the Finnish wellbeing economy, discuss its relationship to the Nordic welfare model, and explain how the wellbeing economy has successfully given rise to rapid and inclusive growth.

Abstract citation ID: ckae144.626
The potential of EU policies for achieving wellbeing economies

Caroline Costongs

C Costongs[1]*, I Stegeman*[1]*, V Putatti*[1]*, A Godfrey*[1]
[1]EuroHealthNet, Partnership of Health Equity and Wellbeing, Brussels, Belgium
Contact: c.costongs@eurohealthnet.eu

The environmental crisis, growing levels of social inequalities and rising levels of non-communicable diseases are all symptoms of economic systems that are failing to generate wellbeing. There is increasing support for the notion that addressing these crises requires shifting the focus from economic growth to a broader range of measures that reflect wellbeing, through more comprehensive, consistent and integrated policy approaches to deliver this. This presentation explores to what extent the concept of the Wellbeing Economy is being applied at the EU level, by tracking changes in some of the EU's key policies and strategies over the past 10 years and in the Semester process, as a mechanism to implement them. It concludes that while progress towards more integrated policy approaches have been made, it is limited by the continuing emphasis on economic, over other policy areas. Recommendations will be made for an even more comprehensive EU Strategy that enables policy sectors to deliver wellbeing objectives in a more coordinated manner and on how to ensure health and wellbeing remain on policy-making agendas.

Abstract citation ID: ckae144.627
How do health systems and health contribute to the sustainable development goals?

Jonathan Cylus

[1]European Observatory on Health Systems and Policies, London, UK
[2]WHO Barcelona Office for Health Systems Financing, Barcelona, Spain
[3]University of York, York, UK
Contact: j.d.cylus@lse.ac.uk

While there is considerable research and policy interest into how factors outside the health system (i.e. social determinants) influence health outcomes, there has historically been less interest in how health and health systems affect other economic and societal objectives. Such evidence can be useful to health policymakers making the case for investing in health systems to demonstrate that health systems do more than just improve health. The European Observatory on Health Systems and Policies has put together a special issue of the journal Health Policy to explore the evidence on how health and health systems advance the Sustainable Development Goals (SDGs), which provides a helpful conceptual framework for considering economic and societal objectives. The articles each consider a particular SDG and review relevant literature with an emphasis on causal studies to explore the ways in which health and health systems have causal effects on key societal objectives such as poverty reduction, gender equality, climate change, and responsible consumption. In this presentation we will provide a summary of the findings from the special issue, highlighting areas with the strongest (and weakest) evidence and discuss how this work can be factored into budget negotiations and decisions about resource allocation.

10.D. Oral presentations: Bridging the gap of health inequalities

Abstract citation ID: ckae144.628
Future patterns of health inequalities in the population of England to 2040: a microsimulation study

Ann Raymond

A Raymond[1], T Watt[1], HR Douglas[1], L Rachet-Jacquet[1], A Head[2], C Kypridemos[2]
[1]REAL Centre, Health Foundation, London, UK
[2]Department of Public Health, Policy and Systems, University of Liverpool, Liverpool, UK
Contact: Ann.Raymond@health.org.uk

Introduction: The existence of wide inequalities in health across England is well-documented. Our research adds to this evidence on inequalities in self-reported health by describing current patterns and projecting future patterns of inequality in diagnosed illness across multiple conditions by deprivation.

Methods: We used the IMPACTNCD microsimulation model that simulates a close-to-reality synthetic population of adults in England from 2019 to 2040. This model combines individual-level data on demographics, health and mortality from linked administrative data for primary and secondary care with survey responses on individual-level risk factors and epidemiological evidence on the associations between risk factors and chronic illness. This model can be adapted for other countries based on data availability. We used the Cambridge Multimorbidity Score (CMS) as our multimorbidity measure. This assigns a weight to 20 common long-term conditions based on individuals' healthcare use and their likelihood of death. We further focus on "major illness" which corresponds to a CMS greater than 1.5.

Results: In preliminary results, we project that health inequalities are not projected to improve between 2019 and 2040. In 2019, the difference in the average time spent without major illness between the most and least deprived 10% of areas in England was 10.4 years. This is projected to remain largely unchanged at 10.7 years (8.8, 11.7). We also find that in 2019, the share of working age people living with major illness in the most deprived 10% of areas in England (14.6%) was more than double the rate seen in the least deprived 10% of areas (6.3%). In 2040, we project these rates to remain largely unchanged at 15.2% (13.0%, 17.6%) and 6.8% (5.4%, 9.1%) respectively.

Discussion: On current trends, health inequalities are projected to persist into the future. This has significant implications not just for population health but for labour supply and wider economic growth.

Key messages:
- If current trends in risk factors continue into the future, existing wide inequalities in diagnosed illness in England are projected to persist onto 2040.
- With significant disparities in major illness among the working-age population, this has implications not just for population health but for labour supply and wider economic growth.

Cancer poses a significant public health concern. Reports highlight that cancer-related mortality rates are double among people experiencing homelessness (PEH). CANCERLESS project delivered an innovative solution based on the Health Navigator Model (HNM). The HNM is an evidence-based patient-centred intervention that develops patient empowerment through health education and social support, promoting timely access to cancer prevention services. A pre-post design study conducted across four pilot sites in Europe (Austria, Greece, Spain, UK) involved 652 PEHs. Pilot interventions based on the HNM were implemented, with effectiveness evaluated at baseline and post-intervention. The study assessed the impact of the HNM on various factors including risk behaviors, lifestyles, quality of life, empowerment, health literacy, psychological distress and utilization of health and care services. Preliminary findings from CANCERLESS HNM intervention showed significant improvements ($p= .000$) in participants' quality of life (55.82 (27.65) vs. 66.18 (22.27)) and sense of empowerment (25.58 (19.95) vs. 59.94 (43.10)). However, there were no observable impacts in health literacy ($p= .509$) or psychological distress ($p= .140$), which remained within acceptable ranges both pre- and post-intervention. Similarly, there were no significant changes observed in lifestyle or risk behaviours among PEHs. Nonetheless, the evaluation of effectiveness suggested that the HNM increase in the uptake of cancer prevention care, such as cancer screening ($p= .000$). The CANCERLESS HNM intervention significantly improved the quality of life and empowerment of PEHs. Additionally, it successfully promoted their involvement in cancer prevention efforts, addressing disparities in access to preventive healthcare services. Increased engagement in such initiatives can lead to early detection and treatment, ultimately reducing cancer morbidity and mortality rates, thereby positively impacting public health.

Key messages:
- By promoting health equity and social justice, interventions like CANCERLESS HNM contribute to building healthier and more resilient public health systems.
- CANCERLESS boosts cancer prevention awareness, tackles healthcare disparities, enhances cancer early detection, benefiting public health.

Abstract citation ID: ckae144.630
The social gradient in institutional trust from 2011–2019 in the general population in Norway

Camilla Ihlebaek

C Ihlebaek[1,2], C Stenmarch[1], ECA Nordboe[1], A Skipstein[3]
[1]Department of Public Health Science, Norwegian University of Life Sciences, Aas, Norway
[2]Faculty of Health and Social Work Studies, Ostfold University College, Fredrikstad, Norway
[3]Section for Society and Public Health, Ostfold County Council, Sarpsborg, Norway
Contact: camilla.ihlebak@nmbu.no

Background: Trust is described as the glue of healthy societies. Although Norway is among the countries with the highest levels of trust in public institutions, the increasing socioeconomic differences observed may threaten levels of institutional trust. Therefore, we aimed to investigate such differences in the general population between 2011 and 2019.

Methods: A repeated cross-sectional study was conducted using data on the general population in Østfold county from 2011 (N = 16673) and 2019 (N = 15935). Differences in trust toward five public institutions (healthcare system, school system, labour and welfare administration (NAV), police, and municipal council) by educational level were investigated with Chi-square tests. Logbinomial regression analyses were used to examine potential changes in high trust over time. Gender and age were included in the analyses as control variables.

Results: A relatively high proportion of the general population reported high levels of trust to the health care system (2011: 71%; 2019:80%), police (2011: 73%; 2019:77%), and the school system (2011: 64%; 2019:66%), whereas a lower proportion reported high levels of trust to NAV (2011: 37%; 2019:41%) and the municipal council (2011: 45%; 2019:36%). Both in 2011 and 2019 a clear social gradient in institutional trust was found for all institutions ($p < 0.05$). There was a significant increase in the level of trust in the health care system (low education:RR=1,10; middle:RR=1,12; high:RR=1.06) and a significant decrease in trust in the community council (low:RR=0,77; middle:RR=0,80; high:RR=0,83) in all educational groups from 2011 to 2019. The level of trust in NAV increased significantly in the highest education groups, while a non-significant decrease was shown in the low educational group.

Conclusions: The persisting social gradient in institutional trust is worrying as trust is an important factor in ensuring inclusion, social capital, democracy, and health and wellbeing.

Key messages:

- Institutional trust is an important factor in ensuring inclusion, social capital, democracy, and health and wellbeing.
- The lower levels of institutional trust found in low educational groups could be of particular concern as these groups might be more dependent on the different parts of the welfare system.

Abstract citation ID: ckae144.631
Targeted initiatives to tackle health inequalities, integrating the Leeds Health and Care Workforce

Cara Gates

C Gates[1,2]

[1]School of Health, Leeds Beckett University, Leeds, UK
[2]Leeds Health and Care Academy, Leeds, UK
Contact: c.gates@leedsbeckett.ac.uk

Deprivation and poor health are significant challenges in Leeds, with the poverty gap growing in parts of the city. The Leeds One Workforce approach to narrowing inequalities (NI) was co-designed in 2021 building on the innovative partnership approach already visible in the city. Its phased approach has seen interventions put in place to boost the opportunities for people from marginalised communities to develop their skills and remove barriers to careers in health and care and has global relevance for other localities experiencing high deprivation. The overall NI approach is supported by a long-term and wide-reaching evaluation plan which mobilises our partner organisations and intends to amplify best practice in getting people into careers and supporting this group to develop within the health and care workforce. We will present findings from embedded evaluations of initiatives across the city, and individual case studies, from those who have accessed NI interventions in Leeds. These will explore the relationships and contributions of partnership organisations and presence of any unexpected barriers or facilitators to these interventions. Linking with third-sector organisations and creating accessible pre-employment opportunities to develop core working skills is a vital part of the Leeds approach to recruiting people from priority wards. Additionally, supporting people into careers in health and care which suit their values, interests and personal circumstances, in addition to employing organisations with flexibility and openness towards their employees at their core is a strong factor in recruiting and retaining from areas of deprivation. Partnership working is essential to tackling health inequalities in places of high deprivation to address individual and systemic barriers to securing employment, ensure the best chance of success for community outreach programmes, and maximise efficiencies by combining the efforts of local organisations.

Key messages:

- Leeds, UK is transforming approaches to narrowing health inequalities through partnership working across health and social care education and employment.
- Current and future best practice will be explored to demonstrate transferable NI approaches.

10.E. Scientific session: Confronting the hidden risks: unveiling the disease burden of chemicals in Europe

Abstract citation ID: ckae144.632

Organised by: European Burden of Disease Network
Chair persons: Brecht Devleesschauwer (Belgium), Sara Monteiro Pires (Denmark)
Contact: Brecht.Devleesschauwer@sciensano.be

With increasing industrialization and globalization, Europe faces a complex landscape of chemical hazards, ranging from persistent organic pollutants like PFAS to foodborne chemicals and beyond. Understanding the extent of these exposures and their associated population health risks is crucial for environmental and health policy making across Europe. The burden of disease methodology, particularly through metrics such as Disability-Adjusted Life Years (DALYs), combined with economic costs, plays a crucial role in assessing and addressing the impacts of chemicals on population health. DALYs provide a comprehensive measure that quantifies both the years of life lost due to premature death and the years lived with disability, offering a holistic understanding of the disease burden caused by chemical exposures. Additionally, incorporating economic costs into the analysis enables the evaluation of the financial burden imposed by chemical-related illnesses on healthcare systems, productivity, and societal well-being. By leveraging the burden of disease methodology, stakeholders can make evidence-based decisions to protect health of populations and allocate resources effectively, ultimately promoting healthier environments and communities. Several global and European initiatives provide platforms for evidence generation, knowledge-sharing, and action to address the disease burden of chemicals. At the global level, the Foodborne Disease Burden Epidemiology Reference Group of the World Health Organization (WHO/FERG) has estimated the global burden of foodborne diseases, including those caused by chemical contaminants in foods. At European level, the health impact of PFAS and other chemicals of high concern is being spearheaded by the European Environment Agency's European Topic Centre on Human Health and the Environment, and the European Partnership on the Assessment of Risks from Chemicals (PARC). Furthermore, the Organisation for Economic Cooperation and Development has established a project of an unprecedented scale to measure the economic value of the effects of chemicals on human health. Complementary to these international initiatives, various countries have started to unravel the burden of chemicals based on local data and contextual insights. In this workshop, we will present the state-of-the-art of the disease burden of chemicals, by bringing together insights from key international and national burden of disease initiatives, emphasizing the imperative of addressing the cost of policy inaction in safeguarding public health. We will also show how burden of disease estimates for chemicals can help to monitor the trends towards relevant environment and health goals such as those described in the EU's zero pollution ambition. Through collaborative discussions and knowledge-sharing, we aspire to identify actionable strategies for policymakers, researchers, and stakeholders to effectively address these challenges and promote a healthier future for all.

Key messages:

- Understanding the vital importance of chemical risks for European health, the utilization of DALY and economic costs reveals their true burden, guiding evidence-based policies.
- Global, regional and national initiatives are examining the impacts of chemicals worldwide, contributing to evidence gathering and policy shaping.

Contact: leaja@food.dtu.dk

Foods can be an important source of human exposure to harmful chemicals. Contamination can occur at any stage of the food chain; with chemicals that occur naturally or by anthropogenic pollution in the environment and during production processes from farm level to the kitchen of the consumer. The variety of chemicals in foods is broad and associated with a wide range of adverse health effects. Where toxicological risk assessment of chemicals in foods serves the purpose of protecting populations from exposure levels constituting a health concern, burden of disease methodology provides a quantitative snapshot of the current impact of chemicals on disease occurrence and population health. This allows for the comparison across hazards, health effects and foods and eventually prioritized allocation of resources to maximize health benefits. Following the advice by the World Health Organization Foodborne Disease Burden Epidemiology Reference group (WHO/FERG), WHO published in 2015 the first estimates of the global burden of foodborne disease. More than 400,000 deaths and 33 million disability-adjusted life years were estimated due to unsafe foods in 2010; the largest proportion due to foodborne pathogens, as the contribution of only 3 chemical hazards (dioxins, aflatoxin B1 and cassava cyanide) was included. WHO, once more under the advice by the re-established WHO/FERG (2021-2025), is currently working to update the 2010 estimates. Besides applying updated data and methodological improvements in managing data gaps and time series analysis, WHO's ambition is to consider a wider range of chemicals and associated health effects for the year of 2020. In this presentation, we will share insights on the WHO estimates of the global burden of foodborne chemicals, and explore the methodological opportunities and challenges that estimating the burden of foodborne chemicals provides for informing policies.

Abstract citation ID: ckae144.634
Feasibility of using comparative risk assessment for chemical burden of disease assessments

According to the WHO, about 22% of global disability-adjusted life years (DALYs) can be attributed to environmental risks. However, comprehensive DALY estimates for chemicals are still lacking. In this study, we present a first assessment of the disease burden due to chemicals performed within the European Topic Centre on Human Health and the Environment. We selected the chemicals (groups) lead, cadmium, PFAS, pyrethroids, phthalates, and bisphenol A and estimated the disease burden for 15 risk-outcome pairs. The feasibility of using the comparative risk assessment (CRA) approach was tested, and where possible, DALYs were calculated. Data gathered within HBM4EU were used for exposure assessment. For the case studies, we selected countries with available data on both exposure and health effects. It was feasible to use the CRA, however, a major limitation was the availability of exposure data from human biomonitoring studies in EU countries. E.g. for lead, the disease burden was only calculated for a maximum of 3 countries per health outcome. Here, for mild intellectual disability, the highest number of DALYs was estimated for Germany, with 950 DALYs/1 m. persons aged 3-11 years. For PFAS, a larger set of countries was considered with the highest burden estimated for IQ-loss with 437 YLDs/1 m. babies born in France. Further, the burden due to phthalates was estimated for selected metabolites in up to 19 countries. The highest burden was estimated for the metabolite DEHP and diabetes mellitus, with about 1,324 YLDs/1 m. women in Poland ($\geq$ 25 years). The experience from the analyses supported the feasibility of using CRA for quantifying the burden of disease due to chemicals based on HBM data. The results show that a significant burden can be attributed to the 6 chemicals in the selected European countries. However, exposure data are available only for a small group of European countries, which hampered a European-wide assessment.

Abstract citation ID: ckae144.635
Large scale OECD health valuation study to estimate the economic benefits of chemical regulation

Irene Hu

D Dussaux[1], *I Hu*[1], *O Bystrom*[1], *E Leinala*[1]
[1]Environment Directorate, OECD, Paris, France
Contact: irene.hu@oecd.org

Chemical regulation aims at protecting human health and the environment from the risks of chemicals, while recognizing the economic importance of the use of chemicals. Assessment of the societal impacts of chemical regulation and different policy options requires information on both costs and benefits. So far, regulators assessing chemicals regulations has not had access to high quality and internationally comparable data on the full monetary benefit of reducing health and environmental risk. The OECD has implemented a multi-country stated preference valuation project that covers ten chemicals-related health conditions (e.g. asthma, kidney disease, infertility, etc.) with more than 80 surveys with large samples in 22 countries. The OECD Surveys on Willingness-to-Pay to Avoid Negative Chemicals-Related Health Impacts (SWACHE) project aims to establish internationally comparable values for the willingness-to-pay (WTP) to avoid negative health effects due to exposure to chemicals. The values can be used to demonstrate and measure the economic benefits of minimising the morbidity impacts of chemical regulations, environmental policies and public policies in general. The latest valuation results of the project will be presented, along with key aspects of the joint methodology used and the plans to further expand this work. In addition, the OECD is collaborating with other intergovernmental organisations via the Inter-Organization Programme for the Sound Management of Chemicals (IOMC) to update the cost of inaction estimates for chemicals as part of the Global Framework on Chemicals. An update on this initiative, that can benefit from the results of the SWACHE project, will be provided.

As indicated by human biomonitoring (HBM) studies, exposure to pyrethroids is widespread in Europe with significantly higher exposure observed in children compared to adults. Epidemiological, toxicological, and mechanistic studies raise concerns about potential health effects in humans and, particularly, behavioral disorders such as attention deficit hyperactivity disorder (ADHD) in children at low levels of exposure. Based on an exposure-response function from a single European study and on available quality-assured and harmonized HBM data collected in France, Germany, Iceland, Switzerland, and Israel, an initial estimate of the environmental burden of disease for ADHD associated with pyrethroid exposure (measured by the metabolite 3-phenoxybenzoic acid) was made for individuals aged 0-19 years. The estimated yearly number of prevalence-based disability-adjusted life years (DALYs) per million inhabitants due to ADHD were 34 DALYs for Israel, 26 DALYs for France, 14 DALYs for both Switzerland and Iceland, and 4 DALYs for Germany. Additionally, a substantial number of ADHD cases, averaging 18%, were associated with pyrethroid exposure. Yet, these figures should be interpreted with caution given the uncertainty of some input parameter. In addition to burden of disease estimates due to ADHD, the associated burden of autism-spectrum disorder (ASD) due to pyrethroid exposure and the health economic costs attributable to ADHD and ASD will also be investigated further. To ensure adequate follow-up of policy measures and more robust disease burden estimates, more HBM studies are recommended, along with increased efforts to harmonize the design of epidemiological studies to ensure more meaningful meta-analyses of exposure-response functions. This is particularly important for pyrethroids as more evidence on potential adverse health effects is continuously emerging.

Abstract citation ID: ckae144.637
Evolution and future prospects in quantifying the chemical burden in Portugal

Ricardo Assunção

R Assunção[1], C Martins[2]
[1]Center for Interdisciplinary Research, Egas Moniz School of Health & Science, Almada, Portugal
[2]NOVA National School of Public Health, NOVA University Lisbon, Lisbon, Portugal
Contact: rassuncao@egasmoniz.edu.pt

The quantification of the burden associated with chemicals is essential for comprehending their impact on public health and implementing effective risk management strategies. This presentation underscores the significance of conducting such assessments at both national and local levels, taking into account the exposures and vulnerabilities of those populations. Our objective is to provide an overview of past burden quantification exercises in the Portuguese context while identifying ongoing and future initiatives. Drawing from past experiences, we have initially characterized the burden of the Portuguese population's exposure to mycotoxins through food consumption, particularly aflatoxins, and the consequent health burden. This laid the groundwork for discussing the potential consequences of climate change in this context and the associated burden. Subsequently, various exercises have been undertaken, incorporating diverse data sources, including human biomonitoring. Currently, several exercises are ongoing or planned, addressing different chemicals and contexts. These include arsenic and its association with various types of cancer, mercury and lead linked to cognitive impairment, and air pollution (e.g., PM2.5 and NO2) and its impact on health (e.g., cardiovascular diseases, lung cancer, asthma). Given the evolving challenges posed by climate change and emerging contaminants, understanding the burden of chemicals assumes increased importance, reinforcing the role of these assessments in safeguarding public health, guiding policy decisions, and highlighting the necessity of prioritizing research and surveillance efforts to protect human health and mitigate the adverse effects of chemical exposures.

10.F. Skills building seminar: How public health professionals can use the right to health to advance climate action and justice

Abstract citation ID: ckae144.638

Organised by: Aletta Jacobs School of Public Health (Netherlands), ASPHER, EUPHA-ENV, -LAW, EUPHAnxt, Faculty of Public Health (UK), GNAPH
Chair persons: John Middleton (ASPHER), Vlatka Matkovic (Belgium)
Contact: d.w.patterson@rug.nl

The climate crisis is the single biggest threat to global health, peace and security, a crisis multiplier, and a significant driver of health inequalities. In many areas of public health policy, legal action and litigation have delivered significant and long-lasting impacts. In April 2024, the European Court of Human Rights concluded that Switzerland had violated the right to health of older women in Switzerland by failing to meet its past greenhouse gas (GHG) emissions reduction targets and set future GHG targets. State-of-the-art public health evidence provided by the Intergovernmental Panel on Climate Change and Lancet Countdown on Health and Climate Change were vital to the Court's decision, which has implications for all Council of Europe member states, and globally. Rigorous scientific evidence of health harms, including but not limited to heat stress, can inform other climate litigation grounded in the right to health. Public health researchers and practitioners are essential to this litigation. In recognition of this emerging role, in November 2023 the Faculty of Public Health (UK) and the Aletta Jacobs School of Public Health launched 'From analysis to action: climate change litigation. A guide for public health professionals' at the 16th European Public Health Conference. The guide was also endorsed by ASPHER, ASPPH, EUPHA, Global Consortium on Climate and Health Education, Global Network for Academic Public Health, Lancet Countdown, Public Health Ethics and Law Global Network, and WFPHA. This workshop will familiarise participants with recent rights-based climate litigation and explore the role of public health professionals in identifying, collecting, storing, assessing and presenting this evidence in a form that is accessible to court officials without medical training.

First, there will be short presentations on 1) the role of the law in climate action and the role of scientific evidence of health harms in human rights litigation, and 2) How to collect and use scientific evidence of health harms in climate litigation (15 minutes). Small group discussions will follow, addressing questions such as: The health harm of climate change-related heat stress was a major factor in the 2024 decision of the European Court of Human Rights in KlimaSeniorinnen v. Switzerland: What other health harms could support future cases? In what population groups? What opportunities do you see today for public health researchers and practitioners to compile such evidence to make the most compelling case? How can public health researchers and practitioners work more closely with legal experts and affected communities to bring this evidence to court? (20 minutes) The workshop will conclude with a plenary discussion of these questions and the small group responses. (25 minutes) As a result of the workshop, participants will be better prepared to identify opportunities to contribute compelling evidence of health harms in climate litigation.

Key messages:

- Rigorous scientific evidence of climate change-related health harms is proving central to success in rights-based climate litigation.
- Public health professionals have a key role in identifying and presenting compelling evidence of health harms in climate litigation.

10.G. Practice session: Innovation technology to promote healthy lifestyles: teachings from multinational EU funded projects

Abstract citation ID: ckae144.639

Organised by: EUPHA-FN, -HP, -DH
Chair persons: Eric Breton (France), Anna Odone (EUPHA-DH -IDC)
Contact: giuseppe.grosso@unict.it

The global burden of disease attributable to lifestyle risk factors is constantly escalating on a worldwide scale. Inadequate diet and sedentary behaviors stand out as particularly impactful contributors to chronic non-communicable diseases, resulting in millions of deaths annually and projecting stable, alarming trends for the foreseeable future. These statistics raise significant concerns among public health experts, particularly regarding the pervasive influence of unhealthy lifestyles on younger generations. This demographic cohort's susceptibility poses a substantial threat to the future trajectory of non-communicable diseases and places immense strain on healthcare systems and global health outcomes. In light of these challenges, the imperative for public health initiatives and interventions aimed at promoting healthy lifestyles becomes glaringly apparent. Addressing the root causes of unhealthy behaviors through targeted interventions is essential to reverse the projected trends and mitigate future health risks. Public health authorities shoulder the responsibility of prioritizing such endeavors, as they play a pivotal role in shaping environments conducive to healthy living for present and future generations alike. Embracing innovative methodologies, leveraging technological advancements, and adopting modern approaches are imperative to engage and mobilize younger populations effectively. Initiatives funded by entities such as the European Union serve as promising examples, highlighting the potential for collaborative efforts to drive meaningful change. Sharing the methodologies and findings of such projects within the public health community can catalyze knowledge dissemination and foster collaboration, ultimately amplifying the impact of intervention strategies worldwide. By prioritizing intervention studies for behavioral change, stakeholders can collectively address the pressing challenge of lifestyle-related diseases and pave the way for healthier, more resilient communities. The aim of this workshop is to provide an overview of multi-national EU funded projects aiming to promote healthy lifestyles in the Mediterranean region.

Key messages:

- Innovative and more modern approaches are needed to improve the diet in the Mediterranean region.
- Children and adolescents are the main targets to counteract the rise of non-communicable diseases.

Abstract citation ID: ckae144.640
SWITCHtoHEALTHY: Switching Mediterranean Consumers to Mediterranean Sustainable Healthy Dietary Patterns

Alice Rosi

A Rosi[1], *P Degli Innocenti*[1], *F Bergamo*[1], *A Rosi*[1], *L Calderon Perez*[2], *B Boqué*[2], *F Scazzina*[1]

In the Mediterranean countries profound changes in diet are taking place, largely due to cultural and socio-economic changes in lifestyle, which are leading to the erosion of the Mediterranean food cultures. The diet modernization process is noticeable; it has generated not only a modification of food choices in the direction of unhealthy foods, but also the habit of sedentary behaviours leading to an imbalance between energy intake and consumption. All of this has negative health impacts, as shown by the ever-increasing prevalence of overweight and obesity, as well as the rise of chronic diet-related diseases. The SWITCHtoHEALTHY project aims to generate an overall change of approach to the modern problem of eating behaviours, by strengthening the role of families towards the promotion of the sustainable Mediterranean food model. The main goal is to generate an actual switch to healthier dietary models, that are more consistent with the Mediterranean Diet. The project SWITCHtoHEALTHY aims to generate a dietary behaviour change in the direction of a greater adherence to the Mediterranean food model, by strengthening the role of families in the process of acquiring and maintaining healthy eating habits. The Mediterranean Diet (MD) is a healthy and sustainable food model, with an essentially plant-based dietary pattern (high consumption of fresh fruits and vegetables, cereals, and legumes). This goal will be reached by making available to families a combination of hands-on educational material and digital tools and complementing the dietary and lifestyle recommendations with easy-to-eat healthier snacking products.

Abstract citation ID: ckae144.641
UnDErstanding consumer food choices & promotion of healthy and sustainable Mediterranean diet and LIfestyle in Children and adolescents through behavIOUral change actionS: the DELICIOUS project

[2]Center for Human Nutrition and Mediterranean, University of Catania, Catania, Italy
[3]Faculty of Physical Education, Assiut University, Assiut, Egypt
Contact: giuseppe.grosso@unict.it

Over the last decades, the abandonment of traditional dietary patterns and engagement in unhealthy lifestyles (including poor physical activity, prolonged screen time, poor sleep behaviours) in children and adolescents has been considered an important threat for the future health of the younger generations living in the Mediterranean area and the safeguard of the environment. The DELICIOUS project aims to promote healthy lifestyles among children and adolescents by implementing activities and tools to increase the adherence to the Mediterranean diet with an attention to the environmental impacts of dietary habits. The DELICIOUS project as a single-arm, uncontrolled behavioral intervention program providing formal and non-formal education activities, development of new snacks and recipe reformulation, web/mobile app development, and physical activities to school children and adolescents in five European countries. Over 2000 families joined a preliminary survey to investigate potential determinants of adherence to a healthy diet. Children and adolescents recruited from schools in the parterns' countries are now currently being recruited to participate to the intervention activities. A web application for school canteen and a mobile application for parents have been developed to help both schools and families to track and provide healthy and sustainable meals. The project aims to increase awareness of the nutritional benefits and the sustainability aspects of the Mediterranean Diet and to promote consumers' empowerment through an online platform for sustainable and healthy meal planning in the school canteen.

Abstract citation ID: ckae144.642
A school-based intervention to foster adherence to the Mediterranean diet in adolescents: the PROMEDLIFE project

Cinzia Franchini

C Franchini[1], *P Degli Innocenti*[1], *B Biasini*[1], *L Fontana*[2], *I Endrizzi*[2], *F Gasperi*[2], *L Bontempo*[2], *A Rosi*[1], *F Scazzina*[1]
[1]Department of Food and Drug, University of Parma, Parma, Italy
[2]Sensory Quality Research Unit, Edmund Mach Foundation, Trento, Italy
Contact: cinzia.franchini@unipr.it

The need to maintain the production of local foods characterized by a high nutritional index, update traditional food production methodologies by developing attractive tech-based approaches, promote healthy eating habits that meet consumers' preferences and acceptability, as well as reducing the complexity of supply chains (Farm to Fork) must be addressed to ensure food and nutrition security. This is especially true in Mediterranean countries undergoing dietary and nutritional changes that affect their inhabitants' health while creating many socio-economic and environmental challenges. PROMEDLIFE aims to increase adherence to the Mediterranean diet through a multi-actor approach by encouraging the adoption of a healthy eating lifestyle while decreasing the environmental and economic impact of food production and processing. It also aims to attain optimal food communication and education through training programs that target primary and secondary students as well as their families, from children to older adults. A 4-week nutritional and sensory educational intervention in high school students involves frontal lessons, a web-app for families enrolled, and games on nutrients, food groups, balanced meals and various eating occasions, healthy and sustainable diets. In addition, adherence to the Mediterranean diet, nutritional knowledge, sociodemographic and lifestyle data, picky eating, and food neophobia are investigated. Including nutritional lectures in the school curriculum of high schools promotes knowledge acquisition about healthy diet. However, a period longer than 4 weeks may be necessary to translate this knowledge into improved eating habits. The project is still ongoing, and follow-up data collection will be performed. Final analysis, including data on picky eating and food neophobia, as well as overall eating behavior at follow-up, will allow an evaluation of possible long-term changes.

Abstract citation ID: ckae144.643

A transnational movement to support the sustainable transition towards a healthy and Eco-friendly Agri-Food System through the promotion of MEDIET and its lifestyle in modern society: MEDIET4ALL

Achraf Ammar

A Ammar[1]

[1]Department of Training and Movement Science, Johannes Gutenberg-University Mainz, Mainz, Germany

Contact: ammar.achraf@ymail.com

The Mediterranean diet is considered the world's most evidence-based low processed eating pattern for promoting health and longevity while saving water/energy and conserving land. Unfortunately, due to the modern societal trends, adherence to the Mediterranean diet model is decreasing, while the consumption of takeout and ultra-processed foods and drinks (UPFDs) is exponentially growing, with alarming levels in many European-Mediterranean (EUR-MED) regions. The overall objective of "MEDIET4ALL" is to support the transition from UPFs culture to modern and sustainable Mediterranean diet through the creation of transnational movement aiming at implementing best practices and innovative solutions to enhance the convenience, modernity, competitivity, and shelf life of Mediterranean diet. To achieve this overall objective, different multidisciplinary tailored approaches are proposed. Specifically, multicenter databases of ingredients/food and their providers will be created to promote the accessibility. Additionally, a variety of highly nutritional and antioxidant-rich "Quick & Easy" recipes that respond to modern trends while following the Mediterranean diet and considering sustainability aspects will be developed. To preserve the eco-friendly and food safety characteristics and extend the shelf life of the Mediterranean diet products, active bio-packaging will also be designed. A strategic "MEDIET4ALL" platform and m-app integrating the abovementioned MEDIET4ALL products and combined Mediterranean lifestyle interventions tailored to each user profile will be developed. Traditional and technology-based awareness and motivational campaigns with extensive marketing and advertising actions to promote MEDIET4ALL movement are also programmed. Working under the concept of a multidisciplinary approach consortium, multiple impacts, particularly supporting the transition towards a healthy and sustainable MED diet and lifestyle, are expected.

10.H. Round table: Transforming health systems in Europe to respond to the large-scale displacement from war in Ukraine

Abstract citation ID: ckae144.644

Organised by: Bielefeld University School of Public Health (Germany), WHO/Europe

Chair persons: Kayvan Bozorgmehr (Germany), Martin McKee (UK)

Contact: kayvan.bozorgmehr@uni-bielefeld.de

The Russian invasion of Ukraine in 2022 caused one of the largest population displacements in Europe since World War II. More than 6 million persons have sought international protection in other European countries, distributed in ways that take little account of the host countries' population size, national income, or health system capacity. This workshop provides a platform to present and discuss findings of a health system impact assessment designed to anticipate the range of mid- to long-term impacts of this large-scale displacement on essential health system functions in refugee-receiving countries, identifying the challenges they face and opportunities to develop transformative policies and actions. This task is urgent given the risks of wider conflict in Europe.

Objectives: The workshop will 1) present the main findings from the health system impact assessment in seven refugee-receiving countries, 2) set out options for effective responses, considering policy and implementation perspectives, and 3) capitalise on the expertise of workshop participants to develop and refine policy options for structural reforms that not only help to sustain an effective response, but enhance the resilience of European health systems for the benefit of displaced populations and national residents alike.

Format: The workshop will comprise a panel with three speakers, followed by a roundtable discussion. Each panel member will make a short presentation (5 min) on different, but interrelated aspects of a transformative health system response to a protracted crisis scenario. These will highlight country and regional-level challenges arising during the Ukraine crisis, propose concrete policy options for transformation, and identify intersections between the health system response with other societal sectors and crises.

The workshop objectives and rationales will be introduced by Kayvan Bozorgmehr, including a short pitch-presentation (3 min) highlighting the unequal distribution of displaced persons from Ukraine and the key-findings of the health system impact assessment. The panel will include follow-up presentations elaborating specific aspects in this context: 1. Healthcare models and needs for transformative response in a protracted crisis (Dr. Nino Berdzuli, WHO Special Envoy for Ukraine Emergency Response in refugee-receiving countries); 2. Supra-national health financing as transformative reform: pros and cons (Eilin Rast, Bielefeld University, Germany); 3. Regional Geopolitical Conflicts and Population Health in Caucasus, CIS and Ukraine (Prof. Akaki Zoidze, Ilia State University, Georgia).

The subsequent roundtable discussion will be chaired by Martin McKee. It will focus on the proposed actions and considerations from a policy and implementation perspective, and workshop participants will be invited to contribute to a critical reflection regarding barriers and enablers, as well as required alliances and processes to translate the structural reforms into practice.

Key messages:

- The ongoing conflict-related displacements from Ukraine have created a protracted crisis that will require structural transformations to enhance health system resilience.

- Enhancing healthcare delivery, continuity of care, and effective health financing requires national and supra-national collaboration to sustain effective responses and prepare for future crises.

Speakers/Panelists:
Nino Berdzuli
Division of Country Health Programmes, WHO/Europe, Denmark
Eilin Rast
Bielefeld University, Bielefeld, Germany
Akaki Zoidze
Ilia State University, Tbilisi, Georgia

10.I. Scientific session: A National E-Infrastructure for Aging Research to Improve Public Health

Abstract citation ID: ckae144.645

Organised by: National E-Infrastructure for Aging Research (Sweden)
Chair persons: Ingrid Ekström (Sweden)
Contact: linnea.sjoberg@ki.se

Global life expectancy gains over the last half-century are remarkable. Yet the resulting demographic shift towards an older population poses substantial public health challenges, particularly in healthcare. To address these challenges, a profound and scientifically-based understanding of older adults' health and care requirements is needed. Recognizing the need for a better understanding of the aging process and public health challenges, the National E-infrastructure for Aging Research (NEAR) was founded in 2018. NEAR seeks to promote and support aging research by facilitating longitudinal population-based data usage from 15 well-known Swedish cohort studies on aging and health. It is based on a collaboration between eight Swedish universities and includes 15 databases with individual assessments. NEAR comprises a broad range of biomedical, clinical, social, and psychological health data from more than 90,000 adults who are 50+ years old. These individuals have been followed between 12 and 52 years. The objective of this workshop is to give an overview of the NEAR infrastructure, present results from three ongoing NEAR projects, and their implications for public health: 1) Temporal trends in dementia incidence in Sweden; 2) Personality and biomarkers of neurodegeneration and Alzheimer's disease in Swedish older adults, and 3) Characterizing risk profiles and transitions across living and care settings in Sweden. Infrastructures such as NEAR offer high-quality epidemiological data for achieving broad, interdisciplinary research goals that single databases often cannot provide. Moreover, the value added to these kinds of data includes enhanced sample sizes, variations, representativeness, and generalizability. In turn, this can address an aging society's public and clinical health demands. Eventually, this could lead to sustainable intervention strategies for improving older persons' health in the coming decades.

Key messages:

- Discover new avenues in public health aging research: Gain insights into cutting-edge aging research opportunities in Sweden, exploring key NEAR projects.
- Recognize the value of national infrastructures using high-quality epidemiological data in fostering collaborative and nationally representative public health research.

Abstract citation ID: ckae144.646
Temporal Trends in Dementia Incidence in Sweden: Insights from NEAR Data

Debora Rizzuto

R Thiesmeier[1], G Grande[2], S Hofer[2,3], N Orsini[1], D Rizzuto[2,4]
[1]Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden
[2]Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden
[3]Department of Neurology, Oregon Health and Science University, Portland, USA
[4]Stockholm Gerontology, Research Center, Stockholm, Sweden
Contact: debora.rizzuto@ki.se

Background: This study investigates the temporal trends of dementia incidence in Sweden over a span of 35 years, drawing on data from the National E-Infrastructure for Aging Research (NEAR).
Methods: Our comprehensive analysis encompassed over 10,000 participants aged 50 and above. We estimated dementia incidence rates across the study period, considering birth cohort, age, and sex while controlling for potential confounders. Additionally. We explored potential modifiers influencing the estimated trend of dementia incidence.
Results: The analysis reveals a notable decline in dementia incidence rates, particularly among individuals born in more recently. Octogenarians born in the 1920-1930 cohort had a 74% lower dementia incidence rate compared to their counterparts born before 1900. Similarly, nonagenarians born in the 1910-1920 cohort experienced a 45% lower incidence rate. We further investigate determinants influencing this declining trend, shedding light on various factors shaping the observed patterns.
Conclusions: The incidence rate of dementia in Sweden has shown a consistent decline over the past 35 years, with a notable birth cohort effect indicating lower rates among individuals born more recently. This finding suggests evolving factors in lifestyle, healthcare, or environmental conditions contributing to improved cognitive health outcomes.

Key Messages:

- These findings underscore the importance of proactive public health measures aimed at sustaining and enhancing cognitive health outcomes among aging populations.
- Understanding the temporal dynamics and underlying factors driving these trends can inform strategies for promoting healthy aging and improving the quality of life for older adults.

Abstract citation ID: ckae144.647
Personality and Biomarkers of Neurodegeneration and Alzheimer's Disease in Swedish Older Adults

Jonas Molinder

J Molinder[1], D Vetrano[2,3], H Zetterberg[1,4,5], K Blennow[1,4], M Waern[1,6], L Johansson[1], H Falk Erhag[1], R Sigström[1,7], I Skoog[1,7]

[7]Department of Cognition, and Old Age Psychiatry, Sahlgrenska University, Gothenburg, Sweden
Contact: jonas.molinder@gu.se

Background: Personality is associated with dementia risk. Neuroticism and conscientiousness may be involved in resistance and resilience to Alzheimer's Disease (AD) pathology (ADP). These traits have also been associated with unspecific biomarkers of neurodegeneration; glial fibrillary acidic protein (GFAP) and neurofilament light (NfL). This study explores the role of personality in cognitive ageing.

Methods: We used data from the Swedish population-based studies H70 (individuals age 70 years only), and SNAC-K (individuals ages 60-104). Personality was assessed with the NEO-five-factor inventory. In H70, biomarkers of ADP were measured in cerebrospinal fluid (CSF, N = 305), except NfL which was also available in plasma (N = 1082). In SNAC-K (N = 1754), all biomarkers were measured in serum. We used multivariable regression models to evaluate the association between personality traits and ADP biomarkers, GFAP and NfL among individuals without dementia. We further examined if associations differed by age (SNAC-K only) and sex.

Results: In H70, higher neuroticism and was associated with lower Aβ42/Aβ40 ratio (B=-0.01, p = 0.02). In SNAC-K, higher openness was associated with lower NfL (B=-0.04, p = 0.03). For age 60-66, higher openness was associated with lower NfL (B=-0.09, p = 0.01), higher neuroticism was associated with higher GFAP (B = 0.09, p = 0.01), and NfL (B = 0.10, p = 0.003). For age >80, higher openness was associated with higher ptau-181, (B = 0.14, p = 0.01), and ptau-181/Aβ42 ratio (B = 0.15, p = 0.003).

Conclusions: Higher neuroticism and lower openness are associated with neurodegeneration. Higher openness may also be associated with resilience to AD-pathology.

Key messages:

- Neuroticism may contribute to neurodegeneration in people <70.
- Openness may contribute to cognitive resilience to ADP in people >80.

Characterizing Risk Profiles and Transitions across Living and Care Settings in Sweden

Susanna Gentili

S Gentili[1], A Calderón-Larrañaga[1,2], D Rizzuto[1,2], J Agerholm[1], C Lennartsson[1,3], Å Hedberg Rundgren[2], L Fratiglioni[1,2], D Vetrano[1,2]

[1]Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden
[2]Stockholm Gerontology, Research Center, Stockholm, Sweden
[3]Swedish Institute for Social Research, Stockholm University, Stockholm, Sweden
Contact: susanna.gentili@ki.se

Background: Older adults are at increased risk of frequent healthcare transitions between health care (hospitals) and social care providers (formal care and institutions). Therefore, our objective was to quantify and characterize the potential risk profiles of multiple transitions between living and care settings for older adults.

Methods: Data were obtained from the National E-Infrastructure for Aging Research (NEAR), including the Swedish National Study on Aging and Care (SNAC) and the National Patient Register, to evaluate living and care transitions of over 7,000 individuals aged 60+, across homes, formal care, nursing homes, hospitals, and post-acute facilities. A multi-state model was used to represent moving likelihood.

Results: Over 15 years, the average length of stay was two years at home, one year in home care, one year in institutionalization, eight days in the hospital, and 17 days in post-acute facilities. Older age and being a woman increased the chance of receiving home care after hospital discharge (Hazard Ratio [HR] range 1.35-4.38, 1.06-1.08), whereas multimorbidity and slow walking speed were associated with an 11%-50% increased hazard of hospitalization and home care. Generally, cognitive impairment increased the hazard of institutionalization (HR range 1.99-2.15), and disability was associated with a higher hazard of nursing home placement (HR range 2.57-3.07).

Conclusions: These findings underscore that care transition patterns are associated with different sociodemographic, clinical, and functional characteristics. This highlights the complex and dynamic interplay between these characteristics and social and health care use.

Key messages:

- The study emphasizes that hospitalization is a major driver of transitions between living and care settings for older adults.
- Age, gender, multimorbidity, walking speed, cognitive impairment, and disability all play a role in shaping older adults' transition patterns between different care settings.

10.K. Skills building seminar: Practical and methodological guidance for conducting online qualitative surveys in public health

Abstract citation ID: ckae144.649

Organised by: Institute for Health Transformation Deakin University (Australia), Health Promotion International
Chair persons: Samantha Thomas (Australia)
Contact: samantha.thomas@deakin.edu.au

Online qualitative surveys are surveys which prioritise qualitative (open text) questions in data collection. Researchers have stated that these types surveys have rich potential for qualitative researchers. They are able to collect rapid insights into new or emerging areas of health, and are an effective way of reaching populations who may not otherwise engage in qualitative interview studies or focus groups. Although these types of surveys are increasingly used by public health and health promotion researchers, there is very limited discussion in the research literature to guide researchers about the practical and methodological aspects of such surveys. This creates some challenges for qualitative researchers - as well as funders, and peer reviewers - in assessing the rigour and robustness of these studies. Using data from a range of online qualitative surveys that we have conducted with youth and adults relating to gambling, alcohol, climate change, and the commercial determinants of health, we describe the processes associated with developing, implementing, interpreting, and writing up online qualitative survey data. In this practical and interactive multimedia workshop and developing on the work of Braun, Clarke and colleagues, with a focus on Big Q interpretivist qualitative approaches. We will provide:

1. Practical examples, and lessons learned from our own studies about survey design, question development, the importance of rigorous piloting strategies, the use of novel techniques to prompt

detailed responses from participants, and the decisions that are made about data cleaning.

2. Examples of the types of responses that can be expected in different types of surveys, and how decisions are made about the quality of responses to questions.

3. Guidance about how to analyse the volume of qualitative data that is generated from such surveys, including developing robust mechanisms to ensure trustworthiness of decision making and data interpretation.

4. Tips based on our role as journal editors about how to present qualitative survey data, and how to respond to challenging reviewer comments.

Participants will be provided with a booklet containing survey templates, question examples, tips and examples of how to respond to reviewer comments.

Key messages:

- Online qualitative surveys have rich potential for collecting insights about emerging public health issues.
- This workshop will provide practical and methodological guidance for researchers who are interested in using these surveys.

Contact: anastasia.mansson@ki.se

Introduction: Alcohol remains a significant contributor to mortality and morbidity in Finland and the Baltic countries, particularly among men. This study aimed to assess alcohol policy restrictiveness in this region from 1995 to 2019 using a modified version of the Bridging the Gap (BtG-M) policy scale and examine its association with alcohol-related disease burden.

Methods: The study utilised national statutory laws to score policy restrictiveness (higher BtG-M scores mean stricter policies) and age-standardised rates of disability-adjusted life years (DALYs), years of life lost (YLLs), years lived with disability (YLDs) and deaths per 100,000 from the 2019 Global Burden of Disease Study (GBD). Spearman correlation tests and panel data regression models were applied to assess the association between policy scores and burden of disease.

Results: Finland maintained a high BtG-M score, while the Baltic countries experienced recent increases from initially lower scores. Alcohol-related disease burden showed an inverse association with policy changes in these countries. Strongest association was seen between the BtG-M score and DALY rates attributed to injuries. Premature mortality among men constituted the largest proportion of disease burden. Discussion and

Conclusions: Despite challenges in accessing and comparing policy data over time, we showed a strong association between alcohol policy and alcohol-related harm in Finland and the Baltic countries. This study is one of the first to use the BtG-M scale to monitor changes in alcohol policies over time and their relationship to alcohol-related harm using GBD methodology. The study highlights the effects of national alcohol policies on levels of alcohol-related harm.

Key messages:

- This study stands out due to its longitudinal study design, which quantitatively compares the level of alcohol policy restrictiveness in Finland and the Baltic countries from 1995 to 2019.
- Our study suggests that shifts towards more restrictive alcohol policies are linked to reduction in alcohol-related harm in Finland and the Baltic countries.

Abstract citation ID: ckae144.651

What matters most to healthy older adults in treatment decision making: a discrete choice experiment

Vera Hanewinkel

V Hanewinkel[1], H van der Wal-Huisman[2], S Festen[3], R Schuurmann[2], G van Leeuwen[2], MA Kooijman[2], M Nogarede[2], B van Leeuwen[2], D Brandenbarg[4]

[4]Primary and Long-term Care, University Medical Center Groningen, Groningen, Netherlands
Contact: v.c.hanewinkel@umcg.nl

Introduction: Shifting to a patient centered approach is crucial for a sustainable healthcare system. Understanding individuals' priorities is essential for personalized care, especially in critical illness. Treatment decisions are often aimed at disease-specific outcomes such as life extension or survival, while patient-specific outcomes like maintaining independence may be equally vital. How healthy older adults prioritize treatment outcomes in case of a critical illness is currently unknown. Enhanced insight into their priorities can refine healthcare policy, for more personalized care. This study investigated outcomes (attributes) prioritized in hypothetical decision-making by healthy adults over 50 yr.

Methods: We conducted a Discrete Choice Experiment with individuals aged $\geq$50, comparing six pairs of hypothetical treatments with five attributes: life expectancy, independence, pain, memory complaints and societal costs. Attribute utility was analyzed using a conditional logit model, and latent class analyses were employed to explore preferences in groups.

Results: In 333 participants (mean age 70 +/- 7.7) all attributes emerged as impactful with independence being strongest ($p < 0.05$). Increased life expectancy had positive utility, but only for a two-year increase. Negative utility was found for all other attributes except mild pain and memory complaints. Latent class analyses identified two groups (22.4% and 77.6%). Group one valued life expectancy more (p .019 vs .940), whereas the second group valued independence (p .058 vs.<.001 and societal costs (p.053 vs. <.001) more.

Conclusions: In a hypothetical case of life-threatening disease, for people aged $\geq$ 50 life expectancy was not the sole relevant outcome for treatment decisions; pain, independence and societal costs are important and should be discussed in clinical decision making or healthcare policy.

Key messages:

- Older adults find patient-specific outcomes relevant for decision making.
- Societal costs are found relevant for decision making for treatment by older adults.

Abstract citation ID: ckae144.652
A quantitative study on the impact of a new outdoor advertising restrictions policy in Bristol (UK)

Genevieve Buckland

G Buckland[1], Z Toumpakari[2], R Jago[1,3], S Harding[3], J Nobles[4], J Horwood[3], C Sillero-Rejon[1,3], W Hollingworth[1], S Cummins[5], F de Vocht[1,3]

[5]Department of Public Health, LSHTM, London, UK
Contact: g.buckland@bristol.ac.uk

Background: Bristol was the first city outside London to introduce a policy to restrict adverts for high fat, salt and sugar (HFSS) products and other unhealthy commodities (alcohol, gambling, payday loans) on council sites in 2021. This research evaluates the impact of this policy.

Methods: We conducted a controlled repeated cross-sectional study of Bristol (intervention) and neighbouring South Gloucestershire (control) residents before ($n = 2{,}543$) and after ($n = 2{,}043$) the policy came into effect. Self-reported exposure to adverts of HFSS products, alcohol and gambling and consumption/use of these products was collected. The intervention effect was analysed using a weighted controlled before-after design. In addition, we analysed 2020-23 timeseries of foods and drinks purchased by 1,012 households from Bristol ($n = 217$) and control areas ($n = 795$) from Kantar's Worldpanel Take Home data. A controlled interrupted time series design was used to estimate the impact of the policy on weekly household purchases of energy and nutrients from HFSS products.

Results: Preliminary results did not indicate significant changes in exposure to unhealthy commodity adverts or consumption/use of unhealthy commodities post-intervention. However, the majority of results suggested a potential reduction; with for example a -22.1 (95% CI -47.3, 16.2) percentage point decrease in reported consumption of fast-food compared to controls. We also did not observe significant differences in weekly energy purchased from HFSS products compared to counterfactual; 897.6Kcal, 95%CI -57.7, 1,853.0, nor in purchases of fat (39.0g, 95%CI -20.1, 98.1), sugar (48.0g, 95%CI -19.8, 115.7) or salt (-0.4g, 95%CI -4.1, 3.2) from HFSS products.

Conclusions: Preliminary results indicate the new policy had no clear impact on exposure to unhealthy commodity adverts or purchasing and consumption of HFSS products. This may be attributable to the relatively small amount of total advertisement space owned by Bristol City Council (~30%).

Key messages:

- Policies restricting adverts of HFSS products and other unhealthy commodities are potentially effective tools to improve diet and to reduce diet-related diseases and public health inequalities.
- We did not observe a measurable impact of this policy in Bristol, which may be attributable to the relatively small Council-owned advertisement estate within the total available advertisement space.

What works to reduce regional health inequalities? A case of East vs West Germany post reunification

Julija Simpson

J Simpson[1], V Albani[1], C Bambra[1]
[1]Population Health Sciences Institute, Newcastle University, Newcastle upon Tyne, UK
Contact: julija.simpson@newcastle.ac.uk

Regional inequalities in mortality are rising across the globe. The case of German reunification offers a unique opportunity to explore how such inequalities can be reduced, or even eliminated: following reunification, a long-standing life expectancy gap between East and West Germany was closed for women and markedly reduced for men in a period of less than 15 years. Drawing from theory on health inequalities, we investigate the contribution of material, behavioural and psychosocial factors likely related to the narrowing of the life expectancy gap between East and West Germany following reunification. We used regional data from official national statistics covering the period 1994-2020 for 15 regions in East and West Germany. Using fixed-effects models with an interaction term for regions in the East, we investigated whether within-region changes in key hypothesised factors (social security expenditure, healthcare improvements, changes in alcohol consumption, and life satisfaction), have had differential impacts on life expectancy at birth and at 65 years. We find that increases in social security benefits in the East following reunification has been the most important factor for lowering inequalities between the two parts of Germany: for every standard deviation increase in social security benefits, life expectancy at birth increased by an additional 0.20 [0.07,0.33] years for males and by 0.15 [-0.01,0.31] years for females in East relative to West Germany. We find the protective effect of social security benefits also for women at 65 years (additional 0.14 years [0.006,0.268]) but not for men. Overall, our findings suggest that increasing social security expenditure could be an effective policy-based tool for reducing health disparities across regions with different levels of economic development. This provides additional support for the relevance of the materialist hypothesis and the political economy of root causes of health inequalities.

Key messages:

- Our findings suggest that increasing social security expenditure could be an effective policy-based tool for reducing regional health disparities.
- We find support for the materialist and political economy approaches to explaining health inequalities.

Reinterpreting the NRA's Eddie Eagle GunSafe® program as a corporate political activity

May van Schalkwyk

MCI van Schalkwyk[1], B Hawkins[2], N Maani[3], M Petticrew[4]
[1]Department of Health Services Research and Policy, LSHTM, London, UK
[2]MRC Epidemiology Unit, University of Cambridge, Cambridge, UK
[3]Global Health Policy Unit, University of Edinburgh, Edinburgh, UK
[4]Department of Public Health, Environments and Society, LSHTM, London, UK
Contact: may.vanschalkwyk@lshtm.ac.uk

Background: In the US firearm injuries are the leading cause of death among children and adolescents. However, and despite there being limited evidence to support the adoption of gun safety education programs, firearm industry-funded groups like the National Rifle Association (NRA) promote the delivery of their education-based Eddie Eagle Gunsafe® program while lobbying against other firearm policies less favourable to the firearm industry. The study aimed to address an important research gap by examining how the NRA frame gun ownership, safety and the role of the Eddie Eagle GunSafe® program as an effective firearm safety intervention and whether the design, promotion and delivery of the program serves the corporate political interests of the firearm industry, and if so, how.

Methods: We conducted a critical analysis of program-related texts and films and the NRA's practices to promote its legitimacy and effectiveness, guided by the application of published taxonomies of corporate framing and action strategies. Data was collected from the program-specific websites and other NRA outlets to capture the breadth of strategies used to promote their education program.

Results: The NRA's practices support the corporate political agenda of the firearm industry. The NRA adopts framing and action strategies that present the presence of firearms in homes and communities as inevitable and normal and the education of children through the delivery of their "lifesaving" program as the commonsense and effective way of keeping children safe from firearm injuries. They make misleading claims about the effectiveness of the program while undermining the credibility of those who advocate for the safety of children and adolescents.

Conclusions: The ongoing delivery of the Eddie Eagle GunSafe® program needs to be questioned. Policies based on a recognition that children and adolescents are safest when their homes and communities are free of firearms are needed to prevent firearm injuries.

Key messages:

- The NRA makes misleading claims about their program's effectiveness and distorts understanding of what is needed to prevent firearm injuries and ensure the safety of all children.
- The firearm industry needs more attention from the global public health community. Evidenced policy measures that prioritize the prevention of firearm injuries are needed to save children's lives.

10.M. Scientific session: JA ImpleMENTAL Abstract Workshop

Abstract citation ID: ckae144.655

Organised by: JA ImpleMENTAL, EUPHA-PMH
Chair persons: Vasileia Konte (Greece), Jutta Lindert (EUPHA-PMH)
Contact: v.konte@eody.gov.gr

JA ImpleMENTAL is major initiative across Europe and was initiated on the request of Member States, on October 2021 under the European Union 3rd Health Programme. The workshop is organized by JA ImpleMENTAL in partnership with EUPHA Mental Health Section, a member of the JA ImpleMENTAL Stakeholder Forum. It will include four presentations that will contribute to an interesting discussion about the future of community mental health services that are user-centered, recovery-oriented and human rights based as well as about the synergies with national strategies and the EU Initiatives. Vasileia Konte the JA ImpleMENTAL Coordinator will provide an overview of the Mental Health System Reforms based on the Belgian Best Practice model, which is implemented in 11 countries. It will elaborate on key activities and prioritized key areas of mental health system transformation as well as enablers, barriers and key lessons learned from the implementation process. Danijela Štimac Grbić from Croatia will present the Croatian experience in the implementation of a mobile rehabilitation team for providing psychosocial interventions in the community in which peer workers are employed for the first time. Based on the successful work of the mobile team, Croatia has included 30 new mobile teams in its network of public health services that will operate throughout Croatia. Teresa Nicolas Lopez from Murcia Spain will present the project "Inclusive Life Projects" which offers comprehensive community care to adults with severe mental illness within projects of autonomous living and provides a concrete and real response to their needs, with the ultimate objective of avoiding the risk of institutionalization. Anna Paradesioti from Cyprus will focus on how to achieve a smooth transition from inpatient to community mental health services promoting collaboration among those services and professionals, by adopting an intersectoral approach. Jutta Lindert will provide valuable comments by bringing helpful insights and views of the Stakeholder Forum.

Key messages:

- Transformation towards community based care increase availability and efficiency of services.
- User's centered human rights based recovery approach care with engaging stakeholders including people with lived experience.

Mental health challenges affect more than one in six people across the EU. In order to support Member States to proceed with mental health care system transformation and suicide prevention JA ImpleMENTAL, was initiated on the request of Member States, on October 2021 under the European Union 3rd Health Program. The JA consists of 39 organizations from 21 countries, more than 180 persons are working. Two advisory bodies support the consortium and provide their insights and expertise, a stakeholder forum with 10 key European Organizations in Mental Health including EUPHA Mental Health Section and WHO Europe and OECD, and the Member State Policy Committee which ensures the involvement of ministries and enables the practices to be embedded in health systems. Within the 11 countries implementing pilots under the

Belgium model using a common Implementation Strategy, a total 163 activities are implemented under the 5 following key areas: 62 on structural measures needed for the establishment of local networks promoting a user's centered, human's right based recovery approach, 43 for the development and/or transformation of mental health services, 22 on training & capacity building in support of the reform and cultural change, 22 on continuous communication, information and awareness raising, and 13 on data collection, monitoring and evaluation. An analysis of MS pilot action plans shows that most service transformation efforts have concentrated on: defining care pathways for people at risk and for those with mild to severe mental health conditions including smooth transition from child and adolescent to Adult Mental Health services, as well as from inpatient to community services, the nomination of case managers for assisting individuals to their recovery process the development of individual service plans, the Involvement of users in various layers of service delivery including peer support and the provision of assertive treatment through mobile units.

The Republic of Croatia has initiated numerous reforms in the mental health care system in the community. Within the framework of EU JA Implement, a mobile team was formed to provide interventions in the community, that is, in the homes of persons discharged from psychiatric hospitals. The mobile team was formed during 2023. The team includes: one psychiatrist, leader and coordinator of the mobile team, three graduate nurses, a case manager, a social worker, three experienced experts who are employed in the team as peer workers, and one social pedagogue and psychologist. The wider composition of the team includes a psychiatrist who provides outpatient psychiatric treatment, who is familiar with the individual recovery plan and, if necessary, participates in the development of the plan. The goal of establishing a mobile team is to implement an individual recovery plan in the community, that is, in the patient's home, using biopsychosocial interventions, with the aim of better and faster recovery of the user and inclusion in the community, as well as prevention of rehospitalization and disability. Before the patients home visits, the experts in the team were trained. 15 patients were included in the pilot project, with whom 96 home visits or interventions were carried out in the time period from the establishment of the team to April 2024. As a result of the effectiveness of the pilot project, in 2024, in accordance with the Strategic Framework for the Development of Mental Health until 2030, the Republic of Croatia adopted a new network of health institutions, within which 30 mobile psychiatric teams and 24 psychological teams at the primary level of health care are planned. Empowerment of users, engagement of people with experience in the implementation of interventions, increase in mental health literacy of the population and destigmatization are additional results of the implementation of mental health protection in the community through JA impleMENTAL.

[2]Mental Health, Medical School, University of Cyprus, Nicosia, Cyprus
Contact: lampros.samartzis@gmail.com

In order to accelerate psychiatric reform in Cyprus we took advantage of JA Implemental during the pilot implementation of Belgium best practices on facilitating the transfer of mental patients from mental hospital to the community mental health services. A multidisciplinary network has been organized between Athalassa Mental Hospital, that is the only mental hospital in the Republic of Cyprus performing 700 patients admissions yearly, and the Community Services of sector 1 and sector 2 of Nicosia Community Mental Services. The network meets regularly in order to facilitate therapeutic culture change in the direction of increasing the percentage of hospital patients that are motivated and prepared to be voluntarily moved for care by the community multidisciplinary teams. This is going to facilitate discharges from hospital, decrease duration of hospitalizations, decrease the frequency of hospitalizations and revolving door readmissions. This increased cooperation is being built on the basis of administrational procedures and clinical protocols that are based on multidisciplinary consensus. The evaluation starts multidisciplinarily in the hospital. A liaison community mental nurse takes part I the evaluation and motivation of the patients before the discharge from the hospital. A written informed consent process takes place in the hospital for the voluntary admission in the community mental health care setting. Also an effort is being made for early written referrals and appointments for community psychiatrist, psychologist, social worker and occupational therapist. This pilot action plan is going to increase cooperation of the mental hospital with the community mental health services, to decrease stigmatization and reform therapeutic culture to the direction of treatment in the community and recovery approach, according to Belgium best practices included in the JA Implemental project.

Inclusive Life Projects for people with Serious Mental Disorder and/or addictions

Teresa López Nicolás

T López Nicolás[1], B Ruiz Periago[1]
[1]Mental Health Management, Servicio Murciano de Salud, Murcia, Spain
Contact: teresa.nicolas2@carm.es

Project "Inclusive Life Projects" offers comprehensive and community care to people with SMD/A within projects of autonomous living, which provide a concrete and real response to their needs, with the ultimate objective of avoiding the risk of institutionalization. Currently, 26 actions have been designed and are being implemented within JA ImpleMENTAL pilot in five municipalities in the Region of Murcia: Caravaca, Cartagena, Lorca. Molina de Segura and Yecla with a participation of 50 people with SMD/A. The following elements are selected from the Belgian good practice: • Creation of local intersectoral networks promoting person-centered care process; • Personalization of care through the Individualized Care Plan, responding to the needs, and desires of people with SMI/A, activating the appropriate support; • Professional case manager. It generates the well-being of people on an empathy and trust basis and articulates coordination so that the agreed Plan can be developed as planned.

A strategic and support coordination tool for action and facilitation of institutional support, the Social and Health Coordination Protocol for people with SMI/A, has been developed. The protocol facilitates the creation of coordination structures, among them the Socio-Health Coordination Base Teams stand out, teams made up of professionals from the different agents involved, multi-professional and intersectoral, (Mental Health, Primary Health Care, Social Services, Social Initiative) taking into account the needs of the person. It also serves to share information, detect training needs, influence resources, etc. PETRA, a computer platform, has been developed for sharing information between the systems involved, especially the health system and the social services system, both primary care, hospital care and specialized care. It allows the exchange of information, in real time, between professionals, the planning of actions, and the design of indicators and control and evaluation processes.

10.N. Scientific session: Gender and parenthood: short and long-term income, career, and health inequities

Abstract citation ID: ckae144.660

Organised by: Institute of Public Health of the University of Porto (Portugal)
Chair persons: Teresa Leão (Portugal), Julian Perelman (Portugal)
Contact: teresacostaleao@gmail.com

Despite the last decades' changes in the distribution of household and child-rearing tasks, its main responsibility tends to fall on women. As such, parenting may remain an important determinant of gender inequalities in income, careers, and health and well-being. In 2022, on average, European women's gross income was 12.7% below men's. This income gap is, in part, explained by inequalities in full-time employment: in the EU, 31.5% of women with children worked part-time, which contrasts with 20.2% of women without children, with 4.9% of men with children, and 7.2% of men without children. These income and career impacts may occur due to the persistence of some traditional conceptions of the division of paid and nonpaid labor. These conceptions, and the subsequent inequalities in career progression and income, may be reflected in women's living conditions, work-family conflict, chronic strain, well-being, and health. Yet, it can also be posited that men, experiencing the pressure to remain the main provider in the family and the most recent expectations to comply with childrearing roles, may also see their well-being and health affected. However, countries with higher gender equity have shown better results in life expectancy and healthy life expectancy for women and men. It can be argued that women and men, especially those who have children, benefit from countries with more progressive parental policies, such as longer and more equally divided parental leaves, accessible childcare, or flexible working schemes. It could, thus, be expected that these countries present higher gender equity in paid and nonpaid work division, career progression, and income, with a higher couple balance, and healthier family environments, with health gains for women and men who are parents and their children. This workshop aims to present and open to discussion recent research outcomes on the role of parenthood on income, career, and health inequalities across European countries. It will show results from quantitative and qualitative studies that focus on analyzing these impacts in the short- and long-term. By discussing these results, researchers and public health professionals may grasp parental, labor market, or social policies or health programs to foster gender equality in access to better living conditions and health, especially during and after parenthood.

Key messages:

- Parenthood may widen gender inequities regarding income and career progression, contributing to the gender gap in health and well-being.
- By understanding the magnitude of gender inequities and their distribution across countries, public health researchers and professionals may identify policies that effectively address the gender gap.

Abstract citation ID: ckae144.661

The indirect costs of motherhood and fatherhood: impacts on income, working hours, and perceived health across 32 European countries

Background: Parenthood may affect men's and women's personal lives, professional careers, and well-being differently. In the last decades, structural modifications in gender norms, the labor market, and family-supporting policies have occurred, but with cross-country variations, even within European borders. This study aimed to update the estimates on the impact of parenthood on men's and women's income, working hours, and perceived health status, and better comprehend their variation across 32 European countries, using a longitudinal approach.

Methods: Data from the European Survey on Income and Living Conditions (2004-2020) were used to estimate the income variation and the likelihood of transitioning into a non-income status, less than 40 weekly hours, and less than very good health status, from one year before to one year after parenthood. Estimates were done by sex and country. Pooled effects were estimated using random effects meta-analysis.

Results: We found a short-term 29% income penalty for women and a 12% income premium for men after parenthood. Seventy percent of women who transitioned their status after motherhood shifted to work less than 40 hours per week while no effect was found for men. Regarding perceived health, no shifts were overall observed. A large cross-country heterogeneity was found.

Conclusions: Motherhood-related income penalties concurred with losses of employment and reductions of weekly working hours, while among men the income premiums were not necessarily coupled with transitions to employed status or 40 weekly working hours. The cross-country heterogeneity is, probably, multifactorial, depending on countries' policies, norms, labor market, and social structure.

Background: The intense childrearing years often coincide with the heightened work demands and responsibilities of the career-building years. We aimed to evaluate the association between family-life stage and men's and women's experience of work and private demands, and the conflict between these demands.

Methods: We evaluated 3532 mothers and 731 fathers as part of the Portuguese population-based birth cohort Generation XXI (2018-2020). Data on family-life stage (exposure), work demands, private demands, and work-to-family conflict (outcomes) were retrieved at the 13-year follow-up wave, as well as data on sociodemographic and household characteristics. Family-life stage was operationalized according to the age of the youngest child: stage 1 ($\leq$5 years), stage 2 (6-11 years), and stage 3 ($\geq$12 years). Ordinal logistic regression models were used to estimate associations.

Results: Men reported more frequently long working hours, while women spent more time on household and child-related tasks. After adjustment for parents' and household characteristics, mothers and fathers with younger children were more likely to report spending more time on child-related tasks (ORmothers = 1.83; 95%CI 1.44, 2.33; ORfathers = 2.36; 95%CI 1.41, 3.94), compared to those with older children. Fathers with younger children were also more likely to report spending more time on household tasks (OR = 2.20; 95%CI 1.30, 3.73 for routine tasks and OR = 1.75; 95%CI 1.03, 2.97 for sporadic tasks). Mothers exhibited a significant association between family-life stage and time-based work-to-family conflict when they had younger children (OR = 1.24; 95% CI 1.05, 1.47 for family-life stage 2 and OR = 1.28; 95% CI 1.00, 1.63 for family-life stage 1).

Conclusions: Both fathers and mothers with young children experienced increased private demands, but only mothers experienced work-to-family conflict. This reveals that family and working arrangements remain marked by a gendered pattern against women.

Background: Parenthood significantly impacts the well-being of mothers and fathers. Yet, their experiences may differ according to societal roles and expectations. Parenthood can bring joy and fulfillment, but also emotional strain, particularly for mothers. Fathers' involvement in caregiving has been recognized as crucial for family well-being, but studies on its health impact remain scarce. This study analyzed mothers' and fathers' perceptions of how parenthood affected their personal and professional well-being.

Methods: We conducted 30 semi-structured interviews with Portuguese mothers and fathers living in Portugal, Sweden, Norway, Germany, the Netherlands, the UK, Spain, and Italy. Thematic content analysis was performed to analyze the interviews.

Results: After becoming parents, male interviewees reported career benefits such as higher pay and career growth due to increased workload, while female interviewees reported greater family overload that spilled over into their professional lives. In Portugal, women faced work-life conflict as they felt more competent than their male partners in providing care and maintained their full-time paid work. In countries like Germany and Spain, women assumed the role of main caregivers but reduced their work commitments, either by working fewer hours or leaving the workforce. Self-reported health declined for both after parenthood, but differently. Some fathers engaged in less healthy behaviors, resulting in weight gain. In contrast, mothers, particularly in Portugal, were more prone to express emotions such as guilt, pressure, and anxiety due to role conflicts as workers, mothers, and wives.

Conclusions: Traditional gender norms still shape parental roles in work and family life, differently affecting women's and men's well-being. To address gender inequalities in parenthood, equal access to supportive measures such as shared parental leave is needed, as well as flexible working arrangements and childcare services.

Background: Historically, women's roles were predominantly associated with motherhood, leading to significant career interruptions and lower incomes compared to men. As gender roles have evolved, as did labor policies protecting parents, it would be expected that income penalties in women and income premiums in men would attenuate, especially in the long term. This study aims to assess the association between the number of children and the income earned by women and men in older adulthood.

Methods: We used data from wave 8 of the Survey of Health, Ageing, and Retirement in Europe (SHARE), which includes 43,772 participants with 50 years old or over and their partners, living in 26 European countries. Multilevel analysis was employed to estimate the association between having children and the total, employment-related, and pensions-related incomes, adjusting for sociodemographic characteristics and clustering by country.

Results: The highest median annual total income was identified for individuals living in Bismarkian (€19,000) and Scandinavian countries (€17,708), more than twice the income earned in the European remaining countries. Having had children was associated with lower total income (OR = 0.870 for 1-2 children, OR = 0.773 for 3-5 children, OR = 0.666 for more than 5 children; $p < 0.005$), and women received lower total incomes (OR = 0.694; $p < 0.001$). These patterns were also found for employment- and pensions-related incomes.

Conclusions: There is a long-term negative effect of having had children, and of the number of children, on income, both employment and pension-related, but women continue to receive about 30% lower incomes than men. The adoption of comprehensive policies stimulating a more equal gender distribution of childrearing responsibilities, while protecting parenthood, along with recognizing caregiving responsibilities in pension calculations, could mitigate these disparities and promote gender equity and better living conditions at the older ages.

10.O. Scientific session: Breaking Barriers: Advancing Vaccine Access for Newly Arrived Migrants in Europe

Abstract citation ID: ckae144.665

Organised by: Prolepsis Institute (Greece), Italian National Health Institute (Italy)
Chair persons: Pania Karnaki (Greece), Silvia Declich (Italy)
Contact: n.papaevgeniou@prolepsis.gr

Health disparities are particularly evident in Europe among Newly Arrived Migrants (NAM), in accessing healthcare systems and navigating vaccination services. The AcToVax4NAM project emerged as a pioneering initiative aimed at identifying solutions to overcome system barriers, following a life-course approach. These solutions consist of a broader strategy to promote organisational vaccination literacy and enhance vaccine uptake among NAM. Employing a participatory approach, the project engaged with professionals FOR health (PFH) and NAM to ensure the relevancy of the practices developed, along with the widespread acceptance of proposed solutions and tools tackling access to vaccination services. This workshop is not just about showcasing the outcomes and impact of the AcToVax4NAM project; it's about equipping PFH with practical tools and strategies that are immediately applicable and will ultimately increase vaccine literacy and uptake. By delving into the challenges encountered, strategies employed, and recommendations formulated, the workshop offers invaluable insights for professionals seeking to address similar issues in their respective contexts. We believe that by sharing our experiences and best practices, we can empower others to make a real difference in their communities. The workshop will contain 5 presentations that follow the functional structure of the project, starting with a presentation on the General Conceptual Framework, the foundational element guiding project activities. Following this, we will discuss the development of a migrant-centered and migrant-sensitive tool aimed at improving the communication skills of PFH by providing definitions of vaccine-related terms in an easily digestible way. The third presentation will detail the development of action-oriented flowcharts across consortium countries validated through focus group discussions with PFH; the flowcharts are linked to a comprehensive repository of 359 tools. The workshop will then explore the consortium's efforts in providing vaccine literacy and cultural competency training to more than 200 healthcare professionals. Finally, the outcomes of the pilots implemented in consortium countries will be presented, and recommendations will be made that summarize the evidence-based accumulation of improved access to vaccinations for NAM and, consequently, increase vaccine uptake. This workshop fosters dialogue among stakeholders and showcases collaborative efforts to promote vaccination literacy and uptake among NAMs in Europe. Sharing experiences and best practices empowers PFH to address similar challenges in their communities, offering insights into effective strategies for improving healthcare access and promoting health equity. Finally, insights from the presentations and discussions can inform evidence-based policymaking and shape the development of immunization public health strategies at the local, national, and European levels, inspiring real change in communities.

Key messages:

- Equipping Professionals for Health with strategies to Enhance Vaccine Access for Newly Arrived Migrants.
- Equity through Collaborative Efforts in Promoting Vaccination among Newly Arrived Migrants.

Background: Access to vaccination is a critical aspect of public health, particularly for newly arrived migrants (NAMs) in European Union/European Economic Area (EU/EEA) countries. Despite this, significant barriers exist, necessitating urgent attention. This study addresses the pressing need to improve vaccination coverage for NAMs by developing a General Conceptual Framework (GCF) to understand and overcome system barriers and analyzing possible strategies.

Methods: starting from a theoretical conceptualization, the study employed a mixed-method approach, incorporating literature review and qualitative research. The GCF was formulated based on key components of the vaccination process. Barriers and solutions were identified through a non-systematic literature review and qualitative investigation. The GCF served as a guide for study activities, facilitating data integration.

Results: The study outlines a structured GCF comprising five interconnected steps in the vaccination process: entitlement, reachability, adherence, achievement, and evaluation of vaccination. Barriers and solutions identified through literature review and qualitative research are presented. Strategies to enhance professional knowledge, accessibility, adherence, coverage, and intervention evaluation are proposed. Recommendations include proximity strategies, provider training, migrant-sensitive approaches, and robust data collection.

Conclusions: Equitable access to vaccination is paramount for public health, particularly for vulnerable populations like NAMs in EU/EEA countries. The development of the GCF represents a crucial step towards understanding and addressing barriers to vaccination access. Implementation of recommended strategies can significantly improve vaccination outcomes for NAMs, ultimately contributing to the overall health and well-being of these communities.

[3]Prolepsis Institute, Athens, Greece
Contact: arianna.bellini@uniroma1.it

Issue: Access to vaccination services on their own is often difficult for migrants, especially newcomers (NAM), due to few vaccine literate services. Professionals who meet migrants need easily accessible vaccine information, to strengthen their ability to promote vaccination and facilitate vaccination access for NAM, especially non-medical professionals such as cultural mediators, reception staff, language teachers, social workers and community leaders.
Description: For offering accurate, accessible and actionable information by using plain language, a Glossary of Essential terms on Vaccination was developed and then tailored in each consortium countries, with a participatory approach. The Glossary is structured in two sections: vaccination related terminology and terms specific to country healthcare organization.
Results: 8 workshops were organized in Greece, Italy, Spain, Germany, Cyprus, Malta, Poland, Romania to consult health and non-health professionals who work with migrants to make the tool as actionable as possible (83 participants). Cultural mediators were most represented, followed by NGO operators and physicians. The workshops were held based on shared guidelines, the focus was on assessing the clarity, completeness and usability of the glossary. 90% reported that the glossary is clear and useful, 80% considered the tool relevant, while 75% thought it is easy to use. The Glossary has been formatted with facing text in different languages for each consortium country, thus providing a comprehensive resource (53 final versions).
Lessons: By implementing the glossary, we aim to enable, empower, guide and facilitate access to immunization for NAMs. Sharing an essential vaccine-related information tool with “professionals for health” boosts their advocacy for NAM’s vaccination and healthcare system’s responsiveness to vaccine literacy. The participatory approach increases effectiveness and permeability of the tool itself.

Background: There is a gap in knowledge on the country-specific access to vaccination for Newly Arrived Migrants (NAM) in Europe, the obstacles encountered, and the resources available to surmount these barriers. The AcToVax4NAM project addresses gaps in the vaccination process of NAM in 8 European countries by developing country-specific, action-oriented flowcharts of the vaccination pathway that identify barriers and provide barrier-specific solutions. The flowcharts are linked to a comprehensive Repository of Tools aimed at providing tools to overcome system barriers and ensuring equitable immunization access for NAM in all consortium countries.
Methods: Country-specific action-oriented flowcharts group the vaccination pathway for NAM in the five hubs (entitlement, reachability, adherence, achievement, and evaluation) and offer solutions for identified barriers. Participatory research validated these flowcharts via focus group discussions with 84 total professionals FOR health (PFH) involved in NAM immunization. The tools were sourced from all consortium countries, encompass diverse formats and languages, and provide a holistic approach to vaccination promotion.
Results: The validated instrument was deemed useful, relevant, and easily understandable. Validated barriers included the lack of multistakeholder collaboration, culturally competent PFH, tailored educational materials, and language barriers. Meanwhile, the linked Repository includes 359 tools categorized according to the five hubs of the vaccination pathway. These can be filtered by language, country, type of tool, year of issuance, and/or intended target population.
Conclusions: The flowcharts and the Repository serve as the basis for a pilot intervention aiming to strengthen healthcare system responsiveness to promote NAM immunization. This participatory approach aims to equip PFH with a clear understanding of system-level vaccination barriers and solutions to enhance vaccination uptake among NAMs.

[3]National Centre for Global Health, Italian National Health Institute, Rome, Italy
[4]Prolepsis Institute, Athens, Greece
Contact: marialaura.russo@uniroma1.it

Background: It is essential that healthcare institutions have a high level of organizational vaccine literacy so that they can support Newly Arrived Migrants (NAM) to navigate, understand and make informed decisions on vaccinations in an effort to make uptake equitable. Developing training material for Professional-FOR-health (PfH) working with NAM, i.e. health and non-health workers, can improve the vaccination offer for NAM.
Objectives: A holistic training framework for PfH was designed to increase capacity building skills and cultural sensitivity of the healthcare system in promoting active immunization of NAMs. The blended training should cover four topics: “Vaccine Literacy”, “Cultural awareness/migrant sensitivity”, “Health promotion tools with community-based approach” and “Entitlement to vaccination for NAMs/NAMs profile”. As learners cannot be seen as mere recipients of notions, their needs, motivations, and experiences should be put right at the center of the training process. Therefore, a training guide and materials were shared to Consortium Countries to be adapted and implemented in their context. Training sessions were conducted in the summer of 2023.
Results: A total of 180 participants showed an average increase of 8.2% in correct answers from pre- to post-raining. Notably, 112

participants experienced more than a 10% increase in correct answers. Significant increases were observed across all topics, particularly in Vaccine Literacy (A1) and NAM Profile (A4), with increases of 52% and 74%. The training was evaluated positively with an overall index of 4.2 out of 5. All items analyzed from the satisfaction questionnaire yielded positive evaluations, with an average rating of 4 out of 5.

Conclusions: The evaluation underscores the effectiveness of training in meeting educational needs of participants. This type of training can be the groundwork for the changes needed to make the NAMs vaccination process more guaranteed and inclusive.

[1]Prolepsis Institute, Athens, Greece
[2]Department of Public Health, Sapienza University of Rome, Rome, Italy
[3]National Centre for Global Health, Italian National Health Institute, Rome, Italy
Contact: p.karnaki@prolepsis.gr

Issue/Problem: The imperative task of making access to vaccinations equitable and guaranteed for Newly Arrived Migrants (NAM) in Europe not only highlights a public health challenge but also offers a chance to tackle barriers within health systems. NAMs frequently encounter hurdles in accessing healthcare services, with vaccinations often ranking lower on their list of health priorities. The AcToVax4NAM project developed and implemented tailored interventions for Professionals FOR Health (PFH) working with NAMs in 8 EU countries.

Description of the problem: NAM often overlook vaccinations due to more immediate concerns, and health systems lack a comprehensive approach to vaccinations. Thus, piloted interventions were developed in consortium countries, working with PFH to tackle vaccination barriers. Over 3 months, each country implemented context-specific interventions to enhance health systems' responsiveness using culturally appropriate tools. Key objectives included developing procedures, improving PFH cultural sensitivity communication skills, and assessing NAM vaccination intentions.

Results: Initial findings vary depending on the country's context but generally show notable enhancements in PFH cultural competencies and increased willingness among NAM to get vaccinated. The pilots underscored the importance of tailoring strategies to specific contexts and fostering collaboration among stakeholders for a successful intervention.

Lessons: The results highlight the pivotal role of tailored interventions in addressing vaccination disparities among NAM. As PFH working with diverse populations, their role in implementing similar training programs in other settings facing similar challenges is invaluable to achieving equitable vaccination processes. Recommendations encompassing the lessons learned and challenges encountered throughout the pilot implementation will further facilitate the dissemination of this knowledge amongst relevant stakeholders.

10.P. Scientific session: Improving health security and preparedness: are we leaving someone behind?

Abstract citation ID: ckae144.671

Organised by: WHO/Europe, European Monitoring Centre for Drugs and Drug Addiction, EUPHA-IDC
Chair persons: Lara Tavoschi (Italy), Nicola Cocco (Italy)
Contact: lara.tavoschi@unipi.it

Prisons are unique, high-risk, high-security, complex settings; however, the impact of emergencies on prisons is a concern not only to the prison but also to the functioning of, for example, the criminal justice system, policing and courts, as well as to the general public. Prison environments can amplify infectious diseases. In the context of emerging health threats, this risk could be made into an asset through early warning surveillance and epidemiological studies. Many global and public health actors advocated for the inclusion of prisons and custodial settings in a comprehensive response to emerging threats since the early days of the COVID-19 pandemic and again during the Mpox epidemic. The increase in risk in closed environments and the vulnerability of people living in prisons make prisons and other custodial settings potential hotspots for transmission of infectious diseases and for excess morbidity and mortality. Yet, as mentioned above, prisons have been included to only a limited extent in national preparedness and response plans. Similarly, prisons are not always explicitly mentioned in international guidance on the preparation of national plans or in measures taken in the absence of such guidance. Preventing, predicting and responding to threats to the health of prison populations require scientifically valid, evidence-based interventions and assessment of the positive and negative impact of control measures on the population, especially in view of the unequal distribution of harm and disease among people living in prison and unequal access to mitigation or therapeutic interventions. Because of a general lack of timely, good-quality, translatable evidence on prison health, guidance for the management of health threats in prisons is often based on adapting other sources to the prison setting (so-called "prisonification" of guidelines), rather than on evidence specific to prisons. Prisons and custodial settings may also be affected by other biological, chemical, radionuclear and environmental hazards, all of which must be catered for in comprehensive preparedness and response plans. Timely collection of information is essential for national preparedness and response capacity to ensure rapid identification and response to threats. Again, however, the prison population is often excluded from or not explicitly identified in national surveillance systems. As a result, cases or outbreaks may not be identified or not receive an effective response, due to lack of collaborative structures between prison and public health authorities. Inclusion of prisons in local, regional, national and international emergency planning is therefore essential to test plans and revise guidance on the basis of evidence, exercises and/or real events.

This workshop aims at exploring the current landscape and deriving implications for preparedness and health security in Europe and beyond.

Key messages:

- Prison authorities should be included as stakeholders in the development of national preparedness and contingency plans according to good governance approach.

- Explicit inclusion of prisons and other custodial settings in international and national plans for preparedness and response to emerging health threats is needed.

Are prison settings included in national preparedness plans?

Filipa Alves da Costa

F Alves da Costa[1]
[1]Health in Prisons Programme, WHO/Europe, Copenhagen, Denmark
Contact: azevedof@who.int

With the aim to explore the extent to which places of detention are considered in national preparedness planning in the WHO European Region, a desktop review was conducted and combined with responses to the Health in Prisons European Database (HIPED) survey from Member States referring to 2020. In both searches, the aim was to identify the existence of: 1) national pandemic preparedness plans written prior to the COVID-19 pandemic; and 2) national pandemic preparedness and response plans specific to the COVID-19 pandemic. Where prisons were included, all aspects of pandemic preparedness relating to prisons were extracted and collated as per the main domains of the WHO checklist for influenza pandemic preparedness plans. The desktop review found that 30 Member States had pandemic plans accessible online, but only seven included any mention of prisons. Responses to the HIPED survey suggested wide dissemination of a COVID-19 preparedness and/or response plan, but only six out of 36 Member States referred to prisons or the vulnerabilities of people living in places of detention. The combined findings suggest that prisons are rarely considered in national planning and that lessons from previous pandemics have not led to a change in recognizing that prisons are high-risk environments for pathogen transmission and that failing to consider them in national planning may lead to impacts that affect the wider community.

Preparing for outbreaks of vaccine preventable diseases: why are prisons invisible?

Eamonn O'Moore

E O'Moore[1]
[1]National Health Protection Office, National Health Protection, Dublin, Ireland
Contact: dnhp@hpsc.ie

From 1 March 2023 to 29 February 2024, 30 EU/EEA Member States reported a total of 5 770 cases of measles, 4 864 (84.3%) of which were laboratory-confirmed. Th7e highest number of cases were reported by Romania- at the time of writing, 11,397 confirmed cases, including 12 deaths from 1 January 2023 to 7 April 2024. Measles is a highly infectious disease. The best mitigation is vaccination which is highly effective. Outbreaks in many countries have been driven by decreases in vaccine coverage with a two-dose measles-containing vaccine (MCV), especially evident since the COVID-19 pandemic. In many countries, vulnerable migrant populations, ethnic groups and communities experiencing social deprivation have been over-represented in cases and under-covered by vaccine programmes. We know that prisons contain such populations. Historic seroprevalence studies of prison populations, which themselves are scant, show that prison populations are under-vaccinated. Prisons are a setting that can cause disease amplification. Given these facts, it is perhaps surprising that many countries in Europe cannot provide specific surveillance data on either cases in prisons or vaccine coverage specifically in prison populations. Further, that prisons are not often cited as specific settings for vaccine catch-up programmes in national or regional programmes. This is despite evidence of measles cases and outbreaks historically and currently in several European countries. In the presentation we will ask why this 'blind spot' in national and international disease surveillance continues and what Member States could and should do to prevent the risk of mass outbreaks of measles in prisons, causing pressures on justice and health systems and risking wider community outbreaks. Finally, we will reflect on how this experience should alert us to the risk of other infectious diseases going undetected, unprevented, and under-studies in prisons, threatening our collective health security.

Towards better prepared prisons: monitoring and response to the use of new substances inside prison

Linda Montanari

L Montanari[1]
[1]Public Health Unit, European Monitoring Centre for Drugs and Drug Addiction, Lisbon, Portugal
Contact: Linda.Montanari@emcdda.europa.eu

The use of new psychoactive substances (NPS) became an emerging issue in prisons in a number of European countries in 2014-2015. Synthetic cannabinoids were the new psychoactive substances most often reported, followed by synthetic cathinones, synthetic opioids and new benzodiazepines. Quantitative qualitative data on prison and drugs provided by 27 European Member States, Norway and Turkey to the EMCDDA (European Monitoring Centre for Drugs and Drug Addiction).

An exploratory study conducted in 2017 found signs of NPS use in prison in 22 countries. Based on 2021-2022 data from a few countries, the lifetime prevalence of NPS in prison ranges from <1 to 19%, with large variation by country. Anecdotal information from 2024 referred to the use of new strong synthetic opioids (nitazene) inside prison. A wide range of physical and mental health harms (e. g. psychosis, disorientation, suicidal ideation, aggressiveness to others or self-harm) has been associated with acute intoxication by, and chronic consumption of NPS inside prison. Recent overdoses associated with the use of nitazene were reported in some prisons in Ireland and the UK. Additionally, the use of NPS in prison can have a disturbing impact on prison management, internal violence and bullying. To date, interventions to tackle the problems related to the use of NPS in prison have tended to focus on supply reduction and controls. Health and social interventions have begun to emerge, but they remain limited. Despite signs of increasing challenges posed by the emergence of NPS since several years, prisons remain largely unprepared to monitor and respond to those challenges. A new key task of the revised EMCDDA mandate (EUDA - European Drug Agency from 2nd of July) is to be better prepared to monitor, forecast and respond to new challenges in the drug field. Prisons should be prepared to adequately address the new challenges posed by the NPS to benefit the health and security of people living and working in prison.

Contact: J.bes@nivel.nl

Utilizing electronic health records (EHRs) in prison settings offers a unique opportunity to establish a learning health system (LHS) aimed at enhancing healthcare quality for incarcerated individuals. Despite the challenges inherent in prison healthcare, leveraging EHRs can facilitate data-driven decision-making and foster continuous improvement initiatives. This study describes the results of an intervention aimed at improving EHR data quality in prisons and explores the potential to enhance the development of a robust LHS. We assessed EHR data quality in 2015 (38 prisons) and 2022 (35 prisons) in the Netherlands over six months. Data were extracted, de-identified, and analyzed across demographic, medication use, (history of) diagnosis, and healthcare usage categories. We measured indicator scores and evaluated variation between prisons in data quality. This project was commissioned by the Custodial Institutions Agency. In 2015, age and gender were recorded for 93% of prisoners, increasing to 100% in 2022. Diagnostic coding use rose from an average of 82% in 2015 to 98% in 2022, with reduced variation between prisons. Consultation frequency per inmate ranged from 3 to 13, reflecting challenges in constructing a uniform denominator due to institutional differences. Mental health problems accounted for 17.7% of recorded disease episodes in 2022. In addition, consultations were most often related to oral health (4.4%), drug abuse (3.2%), sleep (1.8%), fear of diseases (1.6%), and respiratory infections (1.5%). Our findings indicate improvements in EHR data quality in Dutch prisons between 2015 to 2022. Integrating EHR data reuse into prison healthcare systems is pivotal for realizing the vision of an LHS in correctional facilities. This study underscores the potential of advancing EHR recording habits and the reuse of EHR data to enhance healthcare quality in prison settings.

10.Q. Scientific session: Evolving landscape of scientific publishing practices: implications for public health

Abstract citation ID: ckae144.676

Organised by: EUPHA-EPI
Chair persons: Stefania Boccia (EUPHA-EPI), Alastair Leyland (EUPHA)
Contact: angelo.pezzullo@unicatt.it

In the landscape of scientific publishing, questionable research practices pose significant threats to the integrity and reliability of health research. This is occurring alongside notable changes in both the quantity and quality of published work. This scientific session aims to dissect the implications of such changes and practices on public health, fostering a critical examination and encouraging proactive discourse among public health professionals, researchers, and policymakers. Meta-research can explore the nuances of publishing ethics and the idea behind this session is seeking to heighten awareness of these issues and initiate meaningful discussions among public health professionals on maintaining the integrity of scientific literature in the health domain. The session will delve into the complexities of contemporary publishing, including the proliferation of mega-journals, trends in retracted papers, journals delisted from scientific databases, and the disturbing trend of paper mills which produce fraudulent research papers. Each aspect will be scrutinized for its potential impact on the credibility of health research and the consequential risks to public health. Structured as an interactive panel discussion, the format of this session is designed to maximize engagement and foster an open exchange of ideas. Participants will be encouraged to contribute their experiences and perspectives after each of the three presentations, enriching the dialogue and enhancing collective understanding. The distinct topics presented will underscore the pervasive nature of publishing practices and malpractices across different aspects of health research, highlighting the interconnectedness of ethical challenges and their broader implications. This session will merge meta-research empirical evidence with practical repercussions, offering attendees a comprehensive perspective on how publishing ethics might be shaping public health outcomes. It aims to equip participants with the knowledge to identify dubious practices and advocate for higher standards in scientific publishing. Improving research integrity is a cornerstone for effective health policies and interventions. The subject matter is poised to stimulate debate, invite scrutiny, and inspire action. Through this discourse, the session will articulate key messages about the urgency of upholding ethical standards in publishing to safeguard health research, providing clear, actionable insights for attendees to implement in their respective fields

Key messages:

- Unethical publishing practices endanger health research integrity and might have consequences for public health outcomes.
- Acknowledging good publishing practices and combating malpractices will foster higher ethical standards in health research.

Growth and challenges in biomedical scientific publishing: the phenomenon of mega-journals

Angelo Maria Pezzullo

AM Pezzullo[1,2], *S Boccia*[1,2,3]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Meta-Research Innovation Center at Stanford, Stanford University, Stanford, USA

Contact: angelo.pezzullo@unicatt.it

The landscape of academic scientific publishing has seen relentless growth, with the number of articles published and indexed on Web of Science exceeding three million in 2023 alone. This increase in both the number of publications and authors has significantly impacted scientific research, enhancing our collective knowledge. In response to the surge in authorship and the shift towards open-access publishing-where authors bear the cost of publication-information has become more accessible to researchers, educators, and policymakers, fueling a lucrative global industry with annual revenues estimated at 30 billion euros. However, the system faces challenges, such as slow peer review times, potential biases towards significant findings, and issues with reviewer recruitment and compensation. Mega-journals like PLOS One and Scientific Reports have emerged in the early 2000s and 2010s, respectively, focusing on methodological rigor over novelty, publishing high volumes of articles. In 2022, mega-journals published a quarter of all biomedical literature, reflecting a shift towards specific publication scopes and capturing larger market shares. These journals charge authors publication fees in return for open access, benefiting from minimal operational costs as they do not produce in-house materials or print editions. Recent concerns include vulnerabilities to poor scientific conduct and potential biases in publication practices. Some sectorial mega-journals offer faster, often perceived as less rigorous, peer review processes. Notably, the International Journal of Environmental Research and Public Health was removed by Clarivate from the Web of Science Core Collection database, with potential wide ranging impact, especially for authors who have published in these journals (e.g., loss of the impact factor, less visibility) explored in the following presentation.

Integrity and accountability in academic publishing: trends and implications of paper retractions and journal delistings

Angelica Valz Gris

A Valz Gris[1,2], *A Cristiano*[1,2], *AM Pezzullo*[1,2]
[1]Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy
[2]Meta-Research Innovation Center at Stanford, Stanford University, Stanford, USA
Contact: angelicavalzgris@gmail.com

In the context of academic publishing, 'retraction' refers to the withdrawal of a published article from the scientific record due to issues such as significant errors, plagiarism, fraudulent data, or unethical research practices. Retractions play a critical role in maintaining the integrity of scientific literature. Retraction Watch, a blog that tracks retractions of scientific papers, lists more than 48,000 retractions in its database, with increasing trend over time (from 450 reported retractions in 2008 to a staggering 7327 retractions in 2023). The extent to which this indicates a heightened vigilance in identifying problematic research or an increased tendency in committing research misconduct or errors is unclear. Retractions can have lasting consequences beyond the retracted paper itself for authors, editors, publishers and the scientific community at large. However, not all retractions are the same, and self-reporting errors might come with minimal effects, suggesting a recognition of accountability and corrective actions. Delisting of a journal from a scientific database such as Scopus and Web of Science refers to the removal of the journal from the database's index. This can happen for various reasons, including quality concerns and ethical issues. Although this phenomenon is not necessarily correlated with the quality, integrity, or reliability of individual papers published in the delisted journal, it might still have significant impacts on the work and careers of researchers. For instance, articles in delisted journals might suffer from decreased visibility or authors might not be able to use it for promotions. The curated list of sources from Scopus is publicly available and lists around 800 discountinued sources due to quality concerns, while Web of Science made the news in 2023 for the delisting of several journals for editorial reasons, including the MDPI's giant, International Journal of Environmental Research and Public Health.

Commercialization of scientific misconduct: the challenge of paper mills

Anna Abalkina

A Abalkina[1]
[1]Institute of Eastern European Studies, Freie Universität Berlin, Berlin, Germany
Contact: abalkina@gmail.com

According to an estimate, there are at least 400,000 papers in the scientific literature originating from paper mills, which are for-profit companies that guarantee the publication of low-quality papers. There is evidence that such papers are accompanied by various forms of scientific misconduct, including plagiarism, image duplication, falsification, and fabrication of data. These papers are cited and included in systematic reviews and meta-analyses, which have negative consequences for science and related disciplines. The scientific community has fragmented knowledge on paper mills, and many paper mills go undetected. Current resources of stakeholders are not sufficient to detect and prevent journals from publishing fraudulent papers. The goal of this presentation is to raise awareness of the paper mills problem and to discuss general 'red flags' of such papers, as well as possible measures to prevent editors and journals from publishing them. These measures may include open peer review, editor training, research on paper mills, improvement of detection methods, and united actions by stakeholders.

11.A. Scientific session: Overcoming Real-World Challenges in Setting up Health Data Linkages for Public Health Policy

Abstract citation ID: ckae144.680

Organised by: Sciensano (Belgium), Université Catholique de Louvain (Belgium), Universiteit Gent (Belgium)
Chair persons: Eduardo Bracho Montes de Oca (Belgium), Laura Int Panis (Belgium)
Contact: eduardoantonio.brachomontesdeoca@sciensano.be

Background: Linking available administrative data has gained momentum in the last years to enhance public health research and public health formulation. Linkage of diverse data sources can be leveraged to understand social-determinants of health, the cost-effectiveness of an intervention, and to evaluate impact of policies. For instance, data linkage has been proven to be a powerful approach to periodically analyze real-world progress of the COVID-19 pandemic. Today, we are witnessing an unparalleled increase in electronic health data stemming from citizens who interact with services such as healthcare providers, employers, sick funds, and other governmental structures. This enormous amount of data opens many innovative possibilities in epidemiological research. The main advantages of the secondary use of data are the following: 1) it is enriching for new collected data (e.g. survey study), 2) it provides comprehensive information of the target population, and 3) it is cheaper than new data collection. Data linkage between data sources is, however, often a herculean task, and it comes with considerable challenges such as: 1) juridical complexity related to intra-national and cross-border data governance procedures, 2) fragmented data integration, 3) data delivery delays. Addressing these challenges is essential to unlocking the true potential of data linkages for timely responses to emerging public health questions, thereby contributing to evidence-based policy and care and transforming our health research into a One Health approach.

Objectives: The workshop's main aim is to present the researcher's lessons-learned and approaches in applying data linkage from an European, and a country-level perspective through case-studies while creating a space for the public to share their own view. In this workshop we aim to 1) provide a helicopter overview of current data linkages approaches in Europe, 2) illustrate this with case studies from an international, and a country-level perspective, and 3) emphasize the challenges and disadvantages of those data linkages, while sharing potential solutions.

Workshop outline: The workshop is divided into a knowledge translation, and an interactive part. In the first part of the workshop, three speakers will give a presentation of each 10 minutes with a Q&A of 5 minutes between each presentation where data linkage will be introduced, and three case studies on how data linkage can be used will be presented. The first presentation will introduce approaches to data linkages in Europe, and will delve into how AI can be used during routine data linkage. The second presentation will show a case-study on how an international data linkages can be done in an European federated manner. The third presentation will further illustrate how nationally data can be linked to investigate health inequalities. In the second part of the workshop, the audience will be invited to interact with the speakers and share their experiences.

Key messages:

- A comprehensive overview of different current data linkages approaches are provided, setting the stage for discussions on methods and best practices.
- Administrative data linkages are a powerful tool to answer important public health challenges, but important challenges related to data governance need to be addressed to realize the full potential.

Abstract citation ID: ckae144.681
A cross-sectional study of data linkage and artificial intelligence practices across European countries

Hanna Tolonen

R Haneef[1], *H Tolonen*[2]
[1]Department of Non-Communicable Diseases, Santé Publique France, Paris, France
[2]Public Health and Welfare, THL, Helsinki, Finland
Contact: hanna.tolonen@thl.fi

Background: The availability of different data sources is increasing with the possibility to link them with each other. However, linked administrative data can be complex to use and may require advanced expertise and skills in statistical analysis. The main objectives of this study were to describe the use of data linkage and artificial intelligence (AI) in routine public health activities and the constraints to linking different data sources.

Methods: A cross-sectional survey was performed across European countries to explore the current practices applied by national institutes of public health, health information and statistics for innovative use of data sources (i.e., the use of data linkage and/or AI).

Results: In Europe, the use of data linkage and AI at national institutes of public health, health information and statistics varies. The use data linkage in routine by applying a deterministic method or a combination of two types of linkages (i.e., deterministic & probabilistic) for public health surveillance and research purposes is common in majority of European countries. The use of AI to estimate health indicators is not frequent among these institutes. The complex data regulation laws, lack of human resources, skills and problems with data governance, were reported by European countries as main constraints to routine data linkage for public health surveillance and research.

Conclusions: Our study showed that the majority of European countries have integrated data linkage in their routine public health activities but only a few use AI. A sustainable national health information system allowing to link different data sources are essential to contribute to public health research. Moreover, it supports evidence-informed health policy making processes with an overview of various aspects affecting population health and may contribute to European pandemic preparedness.

Abstract citation ID: ckae144.682
Framework for approaching federated causal inference based on real-world observational data sources

Nienke Schutte

M Meurisse[1,2], *N Schutte*[1], *N Van Goethem*[1], *F Estupiñán-Romero*[3], *E Bernal-Delgado*[3]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]IREC-EPID, Université Catholique de Louvain, Brussels, Belgium
[3]Data Science for Health Services and Policy, Instituto Aragonés de Ciencias de la Salud, Zaragoza, Spain
Contact: nienke.schutte@sciensano.be

Context: Causal inference methods, generally requiring detailed individual information, allow us to evaluate public health interventions in real-world observational settings. When comparing interventions across borders and for this purpose leveraging distributed sensitive individual-level data, a federated approach can be aided. However, reusing such distributed data while maintaining privacy and interoperability, is a challenging endeavor.

Methodological framework: In the context of the BY-COVID project, a methodological framework to approach federated causal inference was published in October 2023. It is presented as a set of guidelines in the form several consecutive steps, starting with defining a research question, to building a causal model, translating the causal model into data requirements captured within a Common Data Model (CDM), generating synthetic data complying with the requirements captured in the CDM, and developing interoperable analysis scripts which can be distributed for deployment in different federated nodes. The proposed framework was built through implementing and combining existing methodologies and taking into account the principles of legal, organizational, semantic and technical interoperability.

Objectives: This presentation will provide an overview of the proposed framework, and its demonstration by performing an international comparison of the real-world effectiveness of SARS-CoV-2 primary vaccination campaigns in preventing infections at different federated sites. Challenges encountered (e.g. difficulties in complying with data requirements by linking heterogeneous local data sources) and lessons learned in the course of the demonstrator will be highlighted.

Implications: We aim to contribute to a public health research field where the rapid assessment of emerging population-health research questions (potentially feeding into evidence-based policy-making) is achievable, in that way contributing to European pandemic preparedness.

Abstract citation ID: ckae144.683
Unraveling Social Health Inequalities during COVID-19 in Belgium: The Vital Role of Data Linkages

Laura Van den Borre

L Van den Borre[1], *L Cavillot*[1,2], *Robby De Pauw*[1,3], *B Devleesschauwer*[1,4]
[1]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium
[2]Research Institute of Health and Society, Université Catholique de Louvain, Brussels, Belgium
[3]Department of Rehabilitation Sciences, Universiteit Gent, Ghent, Belgium
[4]Department of Translational Physiology, Infectiology and Public Health, Universiteit Gent, Merelbeke, Belgium
Contact: Laura.VandenBorre@sciensano.be

Background: During the COVID-19 crisis, data linkages were set up to efficiently monitor the outbreak and identify vulnerable population groups. Yet, considerable technical, administrative and data security issues have hindered the effectiveness of data linkages as a critical instrument during public health emergencies. This workshop aims to provide a practical demonstration of the challenges encountered in a Belgian data linkage during the COVID-19 crisis, along with the strategies implemented to overcome these challenges. This case study offers insights into the development of a highly sensitive linkage between COVID-19 hospital data and information related to social and health use in Belgium.

Methods: The HELICON data linkage is developed at the individual level to investigate the risk of COVID-19 hospitalization and the influence of various social and biomedical factors during and after the crisis. Data are drawn from data collections on hospitalization from the COVID-19 health surveillance (Sciensano), on the socioeconomic and sociodemographic context (Statistics Belgium), and on healthcare use and reimbursement (InterMutualistic Agency).

Results: A representative case-cohort study is established comprising 1,149,264 million randomly selected Belgians and 44,508 hospitalized patients. Annual follow-up is scheduled over a four-year span, allowing the investigation of pre- and post-pandemic health data from July 2020 to January 2026.

Conclusions: The HELICON data linkage took 3.5 years to complete. Among the many challenges, we were faced with complicated approval procedures, ambiguous data security guidelines, unclear cost estimates, and technical issues related to the analysis environment. Building on these experiences, we explore the strengths and weaknesses of data linkages as a research instrument during the COVID-19 pandemic and discuss which lessons should be drawn to for the post-pandemic era.

11.B. Oral presentations: Innovations in AI for healthcare

Abstract citation ID: ckae144.684

The assessment of society's acceptance of artificial intelligence use in healthcare

Paulina Smola

P Smola[1], *M Wojcieszko*[1], *M Duplaga*[1]
[1]Department of Health Promotion and e-Health, Jagiellonian University Medical College, Cracow, Poland
Contact: paulina.smola@doctoral.uj.edu.pl

Background: We observe the surge of interest and application of artificial intelligence (AI) in various areas. AI use in healthcare and medicine is followed by society with interest; however, acceptance varies depending on the area of its application. This study aimed to understand the differences in acceptance depending on the type of solution and explain the factors influencing the attitude toward the use of AI in healthcare.

Methods: The data from the online survey was collected from a representative sample of 1109 adult Internet users in Poland. The respondents were asked about their acceptance of AI use for several purposes in healthcare. Based on the responses to these items, an ad-hoc score of AI acceptance in healthcare (AIAHC) was developed. The determinants of AIAHC were assessed with uni- (ULRM) and multivariable linear regression (MLRM) models.

Results: The highest acceptance of AI use was found for monitoring medication intake at home: mean (standard deviation, SD)-3.81 (1.39), the lowest for AI making decisions about the mode of therapy -2.78 (1.35). ULRMs showed that significant predictors of AIAHC were age, gender, chronic disease, vocational status, income, the use of the Internet (IU), and e-health literacy (eHL). In MLRM, only gender, vocational status, income, and eHL maintained a significant relationship with AIAHC. Males showed significantly higher AIAHC than females (B, 95%CI: 2.56, 1.42 - 3.71), and students had higher AIAHC than employees (B, 95%CI: 3.01, 0.14 - 5.89). Persons who refused to reveal their income demonstrated lower acceptance of AI use than those who revealed their income (B, 95%CI: -4.64, -6.54 - -2.74). Finally, greater eHL favored higher AIAHC (B, 95%CI: 0.46, 0.34 - 0.57).

Conclusions: Evidently, there is a hierarchy of potential areas of application in terms of society's acceptance. Improving eHL should exert a positive effect on the acceptance of innovative technologies, including AI, in healthcare.

Key messages:
- Citizens show moderate enthusiasm toward the broader use of AI in healthcare.
- E-health literacy exerts a positive effect on the introduction of AI-based solutions in healthcare.

Abstract citation ID: ckae144.685

Effect on comprehension of an AI patient-friendly hospital discharge letter: a quasi-RCT

Francesco Conrado

F Conrado[1], *L Rosset*[1], *G Lo Moro*[1], *G Scaioli*[1], *D Consoli*[1], *F Bert*[1], *R Siliquini*[1,2]
[1]Department of Public Health, University of Turin, Turin, Italy
[2]A.O.U City of Health and Science of Turin, Turin, Italy
Contact: francesco.conrado@unito.it

Background: During transition from hospital to home care, discharge letters serve as a bridge of information between hospital physicians, general practitioners, and patients. However, the complexity of these letters often hinders patient comprehension, leading to medication errors and adverse outcomes. We assessed the effect on patients' comprehension and satisfaction of using AI to transform discharge letters into patient-friendly versions.

Methods: An online quasi-randomized controlled parallel-group trial was conducted in Italy. A synthetic discharge letter for a chronic obstructive pulmonary disease patient was drafted. GPT-4 rephrased the letter into an easier-to-understand version. Participants were assigned to receive either the original or AI-generated letter and completed comprehension assessments and satisfaction survey.

Results: Out of 460, 166 participants received the original letter, and 175 the AI version. The AI group showed significantly higher comprehension scores (median 4;IQR 2-4 vs. 2; IQR1-2, $p < 0.001$) and outperformed the control group in understanding diagnosis, medications, and antibiotic instructions. Perceived satisfaction was higher in the AI group across all measures ($p < 0.001$). Health literacy was a good predictor of comprehension in both arms ($p = 0.013$; $p = 0.015$). Subgroup analysis revealed the AI letter nearly bridged the comprehension gap between non-healthcare individuals and healthcare professionals receiving the original letter.

Conclusions: AI-optimized discharge letters improved patient understanding, and satisfaction compared to traditional letters.

The study underscores the influence of sociodemographic factors like healthcare experience and health literacy on comprehension, advocating for adaptive communication strategies. These findings contribute to discussions about integrating AI in healthcare to develop patient-centered communication approaches.

Key messages:

- AI-generated patient-friendly discharge letters significantly improved comprehension and satisfaction compared to traditional letters.
- Integrating AI in healthcare communication can help bridge comprehension gaps and promote patient-centered care.

Abstract citation ID: ckae144.686

Capability of ChatGPT to support the screening process of scoping reviews: A feasibility study

Kim Nordmann

K Nordmann[1], *F Fischer*[1,2]
[1]Bavarian Research Center for Digital Health and Social Care, University of Applied Sciences Kempten, Kempten, Germany
[2]Institute of Public Health, Charité – Universitätsmedizin Berlin, Berlin, Germany
Contact: kim.nordmann@hs-kempten.de

Background: The time-consuming screening phase in health-related evidence syntheses is increasingly supported by artificial intelligence (AI). However, scoping reviews have not benefited as much as systematic reviews from such AI tools as they utilize conceptual rather than keyword-specific search strategies to address broad research questions. Context-understanding chatbots based on large language models could potentially enhance the efficiency of scoping review screenings. This study evaluates the performance of ChatGPT against an open-access AI tool used for abstract screening in systematic reviews and the costs involved.

Methods: Leveraging data from a prior scoping review, we compared the performance of ChatGPT 4.0 and 3.5 against Rayyan, using human researchers' decisions as a benchmark. A random set of 50 included and 50 excluded abstracts was used to train Rayyan's algorithm and to develop ChatGPT's prompt. ChatGPT 4.0's evaluation was repeated after 5-7 days to assess response consistency. We computed performance metrics including sensitivity, specificity, and accuracy.

Results: ChatGPT 4.0 and 3.5 achieved 68% accuracy, 11% precision, 99% negative predictive value, and 67% specificity. Sensitivity was high at 88-89% for ChatGPT 4.0 and 84% for ChatGPT 3.5. ChatGPT 4.0 showed a substantial interrater reliability between the two evaluations and moderate reliability compared to ChatGPT 3.5. The cost of deployment varied, with Rayyan being free, ChatGPT 3.5 costing $9.06 and ChatGPT 4.0 $505.72.

Conclusions: Given the exponential increase in publications, effective mechanisms to support the screening phase of scoping reviews are needed. Our feasibility study using ChatGPT to decide on abstracts' inclusion or exclusion achieved good performance metrics. Given further positive evaluation, such chatbots might be incorporated in the standard screening process, possibly replacing a second screener, saving time and costs, and accelerating evidence synthesis.

Key messages:

- ChatGPT performs well in supporting screening for scoping reviews, outperforming a traditional AI tool at reasonable costs.
- Employing chatbots like ChatGPT could potentially cut costs and time in scoping reviews.

Abstract citation ID: ckae144.687

Applications of AI in public health: Improving access to high-quality evidence syntheses

Maureen Dobbins

M Dobbins[1,2], *K Rogers*[1], *A Miller*[1], *A Kostopoulos*[1], *H Husson*[1]
[1]NCCMT, McMaster University, Hamilton, Canada
[2]School of Nursing, McMaster University, Hamilton, Canada
Contact: dobbinsm@mcmaster.ca

Issue: Using the best available evidence is crucial for effective public health practice. Health Evidence^{TM} provides access to high-quality synthesis evidence relevant to public health. As the volume of peer-reviewed published literature grows, maintaining a database of this magnitude is increasingly resource-intensive. Artificial intelligence (AI) can be used to reduce the maintenance burden thereby ensuring decision makers can easily access high-quality synthesized public health evidence. These innovative strategies may be transferable to enhance efficient maintenance of large curated databases of published literature.

Description of the problem: In 2020, The Health Evidence^{TM} team conducted extensive training and testing of a supervised machine learning application to explore the accuracy of AI-assisted reference de-duplication and relevance screening. Finding promising results, the team implemented these AI-assisted strategies in August 2020. To assess the impact on the overall screening burden and time saved, implementation data was analyzed between November 2020 to 2023.

Results: For these 3+ years, AI assisted de-duplication and relevance screening was applied to 394,903 search results. The AI assisted de-duplication application removed 31% (n = 123,903) of references as duplicates. From the remaining reference sets (n = 272,253), the AI assisted screening application removed 70% (n = 190,966) of references as not relevant. Quality assurance spot testing found minimal classification errors (n = 1). In total, AI assisted approaches reduced the need for manual screening by 80%, saving approximately 626 hours of manual screening time over three years (or approximately 17 hours/month).

Lessons: With the reality of limited public health resources, continued access to high-quality synthesis evidence is critical. Innovative strategies using AI-assisted applications improves the feasibility of maintaining a large database of quality-appraised public health synthesis evidence.

Key messages:

- Access to high quality synthesis evidence is critical for evidence-informed decision making.
- Artificial Intelligence can be used to efficiently identify evidence syntheses relevant for public health.

Abstract citation ID: ckae144.688

Artificial intelligence to predict estimates of physical activity in small geographic areas

Deborah Carvalho Malta

D Carvalho Malta[1], *TR Faria*[1], *F de Almeida Célio*[1], *J Bottoni de Souza*[1], *C Saar Gomes*[1], *R Tomie Ivata Bernal*[1], *JG Velásquez Meléndez*[1], *L Cardoso*[2], *MA Gonçalves*[1], *JM Almeida*[1]
[1]Saude Publica, Universidade Federal de Minas Gerais, Belo Horizonte, Brazil
[2]Saude Publica, Ministerio da Saude do Brasil, Brasilia, Brazil
Contact: dcmalta@uol.com.br

Background: Artificial intelligence (AI) predictive models have been used to estimate the risk of a certain outcome occurring, using all available variables.

Methods: Using AI methods we have developed a small area estimation (SAE) technique to estimate the prevalence of leisure-time physical activity (LTPA), or who practices 150 minutes of LTPA per week, in small areas, in Belo Horizonte, Brazil, between 2009 and 2018, by the usage of k-means clustering. The VIGITEL, national telephone survey of Risk Factors for non-communicable diseases, was the main source. We applied available data to estimate prevalence of LTPA in 3300 census tracts, aggregated in 150 Primary Health Care (PHC) areas. The prevalence of PA was analyzed between two time periods, due to the low number of census tract interviews. With the available data, we estimate vulnerability clusters, derived from a Health Vulnerability Index (IVS), for the city of Belo Horizonte, according to socioeconomic, sanitation and health indicators, which measure the percentage of the population living in areas of vulnerability in the city. The index main purpose is to support public policy implementation.

Results: Nine clusters were identified according to the Silhouette coefficient analysis, i.e.: low (LO-0, LO-1), medium (ME-0, ME-1), high (HI-0, HI-1, HI-2) and very high) vulnerability (VH-0, VH-1. The prevalence of physical activity ranged from 23.7% (worst prevalence), in area of high vulnerability cluster (VH-1) to 45.5% in a low-risk cluster (LO-1) in period from 2009 to 2014. The prevalence of physical activity increased to 31.4% (high vulnerability cluster) to 52.81% (low-risk cluster) from 2014 to 2018.

Conclusions: The use of AI to estimate the prevalence of physical activity in small areas proved to be effective and highlighted important differences in the city. Thus, national surveys, with a small number of interviews per census sector, can be used to predict risks and health outcomes for small areas.

Key messages:

- The study highlights the importance of using artificial intelligence to predict estimates of risk factors for chronic non-communicable diseases in small geographic areas.
- The study showed less physical activity (PA) in areas of greater vulnerability. This can support health promotion policies and programs that encourage PA.

Abstract citation ID: ckae144.689

Document Indigenous Food Ingredients in China through Youth Participation

Zeyuan Wang

Z Wang[1,2]*, M Ma*[3]*, Y Li*[4]
[1]University of Toronto, Toronto, Canada
[2]University of Toronto Scarborough, Scarborough, Canada
[3]Chinese Academy of Agricultural Sciences, Beijing, China
[4]Good Food Fund China Action Hub, Beijing, China
Contact: zey.wang@mail.utoronto.ca

Problem: Indigenous food systems can affect multiple aspects of Indigenous people's health and contribute to more efficient, sustainable, resilient, and equitable food systems. However, although tens of Indigenous groups live in China, very few projects have targeted their traditional or Indigenous food systems and ingredients.

Description of the problem: The main purposes include documenting traditional and Indigenous foods and medicine, building multiple social media for public impact, encouraging Indigenous youth participation, and advocating a more sustainable food system in China

Results: With the collaboration of Good Food Fund China, the project recruited 257 volunteers from 27 ethnic groups. The project collected 418 traditional food ingredients, produced 18 TikTok short videos to introduce Indigenous ingredients with the maximum number of views in a single post of more than 100,000, organized 16 Indigenous food culture knowledge webinars, translated 14 international case studies in Indigenous food systems with the permission of authors, and published 16 articles about Indigenous food ingredients and culture in the writing camp. The online lives also received more than a million total views. The results were presented at COP26 and COP28. More results will continue to be presented to the public through articles, books, academic papers, documentaries, short videos, online webinars, and other forms.

Lessons: The project demonstrates the potential to use online platforms to advocate and document sustainable food systems and biodiversity through youth participation. More similar projects can be designed in different parts of the world to support sustainable food systems transformation and ignite down-to-earth changes. However, funding and publication channels are still difficulties in the project.

Key messages:

- The first national level youth participation project to document Indigenous food biodiversity in China.
- Take advantage of social media and the internet for public impact.

Abstract citation ID: ckae144.690

Bias analysis on socioeconomic status and lung cancer in a pooled international case-control study

Jan Hovanec

J Hovanec[1]*, B Kendzia*[1]*, A Olsson*[2]*, J Siemiatycki*[3]*, K-H Jöckel*[4]*, K Straif*[5,6]*, J Schüz*[2]*, H Kromhout*[7]*, T Brüning*[1]*, T Behrens*[1]
[1]Institute for Prevention and Occupational Medicine of the German Social Accident Insurance, Bochum, Germany
[2]International Agency for Research on Cancer, IARC/WHO, Lyon, France
[3]University of Montreal Hospital Research Center, CRCHUM, Montreal, Canada
[4]Institute for Medical Informatics, Biometry and Epidemiology, Essen, Germany
[5]ISGlobal, Barcelona, Spain
[6]Boston College, Chestnut Hill, USA
[7]Institute for Risk Assessment Sciences, Utrecht University, Utrecht, Netherlands
Contact: jan.hovanec@dguv.de

Background: Low socioeconomic status (SES) groups showed increased lung cancer risks even after adjustment for smoking habits and other exposures to lung carcinogens. Although several biases were often indicated and discussed, only few studies quantified the impact of potential biases.

Methods: We conducted a bias analysis on the association of lung cancer and SES using data from the SYNERGY project, including 12 case-control studies with 18 study centres from Europe and Canada (16,550 cases, 20,147 controls). SES in quartiles was derived from the International Socio-Economic Index of occupational status (ISEI). Odds ratios (OR) with 95% confidence intervals (CI) were estimated by logistic regression adjusting for age, study centre, and smoking. In addition, we estimated natural direct SES effects and natural indirect smoking effects by inverse odds ratio weighting. In a multiple quantitative bias analysis, we considered impacts of misclassification of smoking status, selection bias, and unmeasured mediator-outcome confounding by a protective genetic factor, and created 95% simulation intervals (SI) by bootstrap. All analyses were stratified by sex.

Results: Adjustment for smoking as well as natural effects estimation showed that nearly half of lung cancer risks of lower SES groups in men and up to one third in women were attributable to smoking. Consideration of all types of bias reduced lung-cancer risks in the fully adjusted logistic regression models, with the strongest impact by selection bias: For the 4th versus 1st (highest) ISEI quartile OR decreased from 1.83 (1.69-1.98 CI) to 1.50 (1.30-1.73 SI) in men, and OR 1.48 (1.27-1.72 CI) to 1.20 (0.96-1.53 SI) in women.

Conclusions: Smoking is the main target for prevention of lung cancer, along with occupational and environmental exposures, in particular in lower SES groups. This finding remains, though our analysis revealed reduced lung-cancer risks of lower SES groups after multiple bias adjustment.

Key messages:

- Impact of potential biases was quantified in the association of SES and lung cancer.
- Lung cancer risks were partially attributable to smoking and multiple biases.

Abstract citation ID: ckae144.691

Adverse childhood experiences and age-trajectories of depressive symptom for middle and older ages

Xuan Ren

X Ren[1], L Li[1], P Demakakos[2]
[1]Great Ormond Street Institute of Child Health, University College London, London, UK
[2]Epidemiology and Public Health, University College London, London, UK
Contact: sejjxre@ucl.ac.uk

Background: Adverse childhood experiences (ACEs) have lifelong impacts on health outcomes. Less is known about their effects on later outcomes (mental health). Moreover, associations of ACEs with age-trajectories of depressive symptoms and how they differ in different countries remain unclear. We investigated associations between ACEs and trajectories of depressive symptoms at mid-to-older ages in two distinct populations.

Methods: We used longitudinal data from English Longitudinal Study of Ageing (ELSA: n = 19602, ≥50y) and China Health and Retirement Longitudinal Study (CHARLS: n = 19561, ≥45y). Depressive symptoms were measured by Center for Epidemiologic Studies Depression scale at 10 waves (2002-2022) in ELSA and at 5 waves (2011-2020) in CHARLS. ACEs were retrospectively reported in both studies. We applied group-based trajectory modelling to identify distinct age-trajectories of depressive symptoms and multinomial regression to estimate associations between ACEs and trajectory groups.

Results: We identified three trajectory groups: in ELSA: high (12.3% in men and 14.7% in women), moderate (46.6% and 47.9%) and low (41.1% and 37.4%), and in CHARLS: high (9.3% and 13.2%), moderate (34.1% and 39.4%) and low (56.6% and 47.4%). Most ACEs were associated with increased risk of having moderate/ high trajectories of depressive symptoms after adjusting for other ACEs, sex, and childhood socioeconomic disadvantages. For example, for physical abuse, the adjusted relative risk ratio (RRRadj) for high and moderate trajectory groups was 2.09(1.99, 2.19) and 1.16(1.12, 1.20) respectively in ELSA. It was 1.34(1.23, 1.44) and 1.22(1.13, 1.32) in CHARLS. For domestic violence, the respective RRRadj was 1.90(1.65, 2.18) and 1.44(1.22, 1.70) in ELSA, and 1.33(1.22, 1.44) and 1.24(1.14, 1.35) in CHARLS.

Conclusions: ACEs have life-long effects on mental health at mid-to-older ages in both countries, highlighting the need of early intervention to improve mental health in later life.

Key messages:

- Our work considered the distinct patterns of age-trajectories of depressive symptoms for adults at middle and older ages, capturing the changing process of mental health problems in later life.
- We also investigated the associations between childhood factors and trajectory of depressive symptoms, which helped to improve mental health for older people under the situation of global ageing.

11.D. Scientific session: Participatory approaches and co-creation in complex interventions to reduce inequity in health

Abstract citation ID: ckae144.692

Organised by: Holbaek Hospital (Denmark), University of Copenhagen (Denmark)
Chair persons: Vivian Rueskov Poulsen (Denmark), Maria Marti Castaner (Denmark)
Contact: vivp@regionsjaelland.dk

Health disparities are linked to social inequalities, necessitating health researchers to address the health gaps that exist between different social groups, particularly in the realm of health interventions. This workshop delves into the significance of co-creation processes and participatory approaches in complex health interventions to reduce social inequities in health outcomes. Through empirical cases illustrating co-creation processes in intervention research, the workshop aims to enlighten the audience on the continuum of participatory approaches. The MRC/NIH framework of complex interventions highlights the importance of engagement with relevant stakeholders throughout the research phases to enhance the likelihood of developing or identifying interventions that can positively impact health outcomes. However, the extent and nature of stakeholder involvement may vary depending on the specific context and stage of the research. While stakeholder involvement has been a longstanding focus, the concept of co-creation, where stakeholders actively participate in the entire process of intervention development, implementation, and evaluation, has emerged more recently. This shift from creating interventions for the target population to collaborating with them in the intervention's creation has led to the emergence of more inclusive health interventions that are contextually relevant and tailored to the local settings where they are intended to create change. Yet, introducing participatory approaches in intervention research may raise new questions about decision-making and power dynamics. While interventions led solely by experts and researchers may overlook the empowerment and capacity-building potential among stakeholders and intervention sites, co-creation processes have the capacity to empower stakeholders and address health inequities effectively. However, challenges persist in ensuring equal collaboration between researchers and participants, especially in disadvantaged groups. This workshop aims to prompt reflection on ethical issues arising from traditional health intervention approaches and approaches to ensure participants' ownership of interventions when they are adapted in new contexts. Moreover, this workshop will discuss the design of participatory interventions: What methods can we use to co-create? What stakeholders to involve? At what stages of the intervention should co-creation occur?

The workshop program begins with an introductory presentation of participatory approaches and co-creation in health intervention research, with examples from a school-based intervention. Next, three empirical cases of co-creation processes introduced in interventions in different contexts are presented. Finally, the audience is invited to a take part in a discussion focusing on how participatory approaches among disadvantaged populations can potentially contribute to reduced social inequity in health.

Key messages:

- The involvement of stakeholders in the development, implementation and evaluation of health interventions can take many forms, and what is meaningful for the specific context needs to be considered.
- Co-creation approaches in health interventions empower participants and address unequal power dynamics between those who deliver and those who receive health interventions.

Abstract citation ID: ckae144.693
Enhancing Health Literacy Among Disadvantaged Youth: A Participatory Approach in School Settings

Vivian Rueskov Poulsen

VR Poulsen[1,2]
[1]Occupational and Social Medicine, Holbaek Hospital, Holbaek, Denmark
[2]Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: vivp@regionsjaelland.dk

Background: School-based health literacy interventions have the potential to significantly impact the health of disadvantaged youth. However, the effectiveness of such interventions varies. The aim of the 'health literacy among youth'-intervention was to improve the health literacy of disadvantaged youth in two school settings in Denmark.

Methods: The intervention began with identifying the health literacy needs of 128 students. Groups of teachers from each school participated in workshops facilitated by the research team to develop activities to address the specific needs of the students. Over the course of one school year (August 2023 to May 2024), these activities were implemented. Questionnaires were administered to students before, during, and after the intervention, and semi-structured interviews were conducted among teachers and students.

Results: Teachers at each school created activities aligned with the organizational structure and the needs of the students, focusing on occupational diseases and injuries, and physical activity and mental well-being, respectively. However, contextual factors such as time constraints, students' characteristics, and teachers' professional backgrounds and varying levels of motivation, influenced the implementation.

Conclusions: The intervention design offered flexibility in tailoring health literacy activities and their implementation to suit the unique contexts of the two schools. While the participatory approach facilitated targeted and organizationally aligned health interventions, its feasibility varied across contexts. Our findings highlight the importance of involving participants in developing health interventions to ensure relevance and alignment with specific needs of the target group.

Key messages:

- Despite contextual similarities, the outcome of participatory intervention approaches may vary across contexts.
- Co-creation contribute to health literacy interventions that are tailored the needs of the target group.

Abstract citation ID: ckae144.694
Co-creating the intervention 'MAMAACT' for improved care for pregnant migrant women in Denmark

Sarah Fredsted Villadsen

SF Villadsen[1]
[1]Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: sfv@sund.ku.dk

Background: The MAMAACT intervention was developed as a response to documentation of ethnic and social inequities in stillbirth in Denmark, despite free and universal access to antenatal care. The MAMAACT intervention aimed to reduce stillbirth in migrant families by improving communication about pregnancy complication during antenatal care.

Methods: The intervention consisted of a training program for midwives and health education materials. It was implemented at a structural level (training of midwives) and, through strengthened needs-based communication during antenatal care, the aim was to improve the health literacy of the women. 19 of the 20 Danish maternity wards participated in the study in 2018-19 and a comprehensive evaluation was conducted. The intervention was co-created with midwifery managers, midwives, and migrant women.

Results: The management and selected clinical midwives participated in the design of the midwifery training and the health education material as well as the intervention's implementation and recruitment strategies for the evaluation. As representatives of the target group, a partnership with the non-profit organization Bydelsmødre was initiated. Bydelsmødre trains migrant mothers living in socially deprived areas to help vulnerable migrant women. Evening sessions were conducted with a specific group of women in their community, where the intervention components, the recruitment to the evaluation, and the interpretation of evaluation findings were discussed. A significant contribution was a video explaining the migrant experiences of becoming a mother in Denmark used in the midwifery training. MAMAACT researchers were invited to present the evaluation at the annual assembly for Bydelsmødre organization in 2019.

Conclusions: The partnership with Bydelsmødre provided a strong voice for migrant women, enhancing engagement with the intervention, recruitment for the trial, and its real-world relevance.

Abstract citation ID: ckae144.695
Carving out space for co-creation in implementation of evidence-based mental health interventions

Charlotte Thomsen

C Thomsen[1], *MM Castaner*[1], *AT Sabriye*[1], *A Buhl*[1], *W Tol*[1]
[1]MESU, Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: charlotte.thomsen@sund.ku.dk

Background: Mental health is identified as a pressing public health priority for European countries challenged by societal changes. The ADVANCE project aims to strengthen our understanding of mental health promotion and prevention in seven countries in Europe. In Denmark, the research project sets out to understand how WHO's stress management intervention Self Help Plus can be embedded within social and integration programmes for adults who have experienced migration.

Methods: We are using a common methodology across the 7 country projects oriented by co-creation with end users and relevant stakeholders to initially develop implementation scenarios and stigma reduction strategies. We will present findings from this process and reflect on the tension and potential of the co-creation methodology in the implementation of evidence-based mental health interventions.

Results: In the first project phase of problem analysis and co-creation, the project's society advisory group discussed 10 tailored intervention scenarios. Then, a Delphi survey and two rounds of scenario-based workshops with additional involvement of 16 end users/actors resulted in a final implementation scenario and stigma reduction strategies. We identified and reflected on questions around ownership of the project, boundaries of the proposed intervention, alignment of expectations, and intervention sustainability within the parameters of the ADVANCE project.

Conclusions: Even when interventions are pre-selected in response to funding calls, co-creation can facilitate the development of acceptable and sustainable implementation strategies. However, meaningful co-creation requires time, flexibility, and negotiation, which is not always guaranteed.

Key messages:

- Co-creation creates productive tension and potential for the implementation of ADVANCE.
- Space for co-creation was negotiated with collaborators to ensure meaningful engagement.

Abstract citation ID: ckae144.696

An integrated work health intervention among cleaners in Denmark

Ole Steen Mortensen

OS Mortensen[1,2]
[1]Occupational and Social Medicine, Holbaek Hospital, Holbaek, Denmark
[2]Section of Social Medicine, Department of Public Health, University of Copenhagen, Copenhagen, Denmark
Contact: osm@regionsjaelland.dk

Introduction: Work-related diseases are increasing and considered a global health challenge. Meanwhile, work-related risk factors and diseases are not equally distributed across occupational groups. Previous work health interventions have not succeeded in reducing the prevalence of work-related diseases. Therefore, integrated approaches combining prevention of disease and promotion of health in work health interventions have been developed. The aim of the Integrated Approach to Health, Wellbeing, and Productivity at Work (ITASPA) intervention was to prevent work-related injuries and diseases and promote the health, safety and wellbeing of cleaners.

Methods: The ITASPA intervention was implemented at two Danish workplaces among cleaners. At each workplace a committee of employees was established to develop their own initiatives to promote the health of the workers. By use of the British Medical research Council's framework, a process evaluation was conducted. Qualitative data (focus group interview and field notes) and quantitative data (questionnaires) of participants evaluated the implementation.

Results: A total of 91 cleaners participated in health checks, and three workshops were held at each workplace. The development and implementation of activities was affected by mechanisms, such as lack of information about the intervention, new power dynamics, and lack of motivation for behavior changes, and contextual factors, such as many replacements, time pressure and absence of managers.

Conclusions: Integrated approaches in work health interventions among employees with short or no education may positively impact employees' health, wellbeing and safety if comprehensively implemented. However, attention should be drawn to interventions that adapt a participatory design, as unintended power dynamics may occur when employees are given the tasks of implementing behavior changes among colleagues. The role of managers to obtain successful implementation should be highlighted.

11.E. Scientific session: Integrating environmental and health sciences for addressing climate and urban challenges

Abstract citation ID: ckae144.697

Organised by: SItI Working group of Community mental health (Italy), EUPHA-URB
Chair persons: Giuseppe Di Martino (Italy), Laurent Chambaud (France)
Contact: vincenza.gianfredi@unimi.it

The escalating challenges posed by climate change and rapid urbanization demand an integrated understanding of how our natural and built environments influence health outcomes. This workshop aims to dissect the complex associations between the environment-both natural and constructed-and physical and mental health. The urgency and breadth of these issues necessitate a multidisciplinary approach, leveraging insights from environmental science, public health, and urban planning. The primary objective of this workshop is to elucidate the multifaceted relationships between environmental conditions and health, identifying actionable strategies to mitigate adverse health outcomes and enhance well-being. Specific goals include: i) to assess the current scientific evidence linking various environmental factors with health, highlighting the role of climate change; ii) to explore innovative methodologies for studying environmental impacts on health; and iii) to foster collaboration among researchers, policymakers, and practitioners for integrated health and environmental planning. Organizing this workshop presents several unique added values. First, it serves as a platform for experts from diverse fields to share findings and refine research methodologies. Second, by synthesizing current knowledge, the workshop will inform more coherent and science-based public health and urban policy. Lastly, it could facilitate networking among stakeholders, fostering collaborations that bridge gaps between research and policy implementation. The workshop is structured to ensure thematic coherence and maximally beneficial interactions among participants. Presentations will be grouped into four thematic blocks: 1. effects of climate change on health; 2. healthy design and public mental health; 3. Planetary health challenges to human health; 4. Climate change perception and mental health.

During the workshop, each speech will be built on the previous one in a sequential way. At the end of the workshop, audience members could join the discussion offering their point of view and directly interacting with the speakers. This workshop stands as a crucial endeavor to integrate diverse perspectives on how environmental conditions impact health and to catalyze significant strides in public health and urban planning. It promises to not only advance scientific understanding but also to translate this knowledge into practical, scalable solutions for health resilience in our communities.

Key messages:

- Urban health is foundational for sustainable cities, integrating health into all policies ensures inclusive, safe, resilient communities as outlined in SDG 11.
- Public health influenced by environmental and local government strategies highlights the need for multidisciplinary approaches to adapt urban planning and health policies.

Abstract citation ID: ckae144.698
Training and capacity building on the effects of climate change on health: a need to up-scaling

Laurent Chambaud

L Chambaud[1,2]
[1]Climate Change and Health, ASPHER, Brussels, Belgium
[2]EHESP School of Public Health, Rennes, France
Contact: laurent.chambaud@ehesp.fr

The need to develop training on the effects of climate change on health is obvious, as the awareness on this topic is growing but the knowledge is not enough disseminated. ASPHER has taken several initiatives to address this subject. Among them, three activities deserve to be highlighted: in cooperation with the GCCHE, we have set up an intensive online course with a great success (nearly 1.000 participants in each of the 10 sessions). With the same partner we have conducted a survey in all SPHs members of our network, to be able to map training activities in the European Region and follow their development. We also work with the European Observatory on climate change and health to reinforce capacity building at European level.

But this is not enough and we have to go faster and further in several directions:

- by linking more closely multidisciplinary research and training, as knowledge is evolving quickly;
- by developing specific training for all public health trainees. This is why we need to incorporate this topic in public health core curriculum;
- by having some modules tailored to different publics: public health professionals, health professionals, but also local, national and European decision-makers and stakeholders.

To conduct these activities, we have to reinforce our different partnerships and create a powerful alliance at the European level.

Abstract citation ID: ckae144.699
Healthy design strategies to promote Urban Public Mental Health, according to the contemporary cities' climate resilience and the SDGs' challenges

Stefano Capolongo

S Capolongo[1,2], *A Rebecchi*[1]
[1]Department of Architecture, Built Environment, Politecnico di Milano, Milan, Italy
[2]EUPHA-URB
Contact: stefano.capolongo@polimi.it

According to the "Urban Health Rome Declaration" at European meeting "G7 Health" that defines the strategic aspects and actions to improve Public Health into the cities, and referring to the Agenda 2030 in which the 11th SDG argue about "Sustainable Cities and Communities. Make cities and human settlements inclusive, safe, resilient and sustainable", one of the most expressive syntheses of the challenging relationship between urban planning and Public Health is stated by WHO (2016): "Health is the precondition of urban sustainable development and the first priority for urban planners". Referring to the Healthy Cities & Urban Health definitions, we can consider Public Health not merely an aspect of health protection and promotion, but an individual and collective condition, strongly influenced by the environmental context and by the strategies implemented by local Governments. The "Health in All Policies" strategy, clearly underlines how health doesn't depend only on the supply of healthcare services, but also, on the quality of outdoor and indoor living environments. Aim of the Presentation 3 is the share the findings of a literature review about the link between the urban contexts' morphological and functional features; the results are divided into: 14 Health Outcomes, representing the main Non-Communicable Diseases (NCDs) whose come from the urban environment's quality and by the adoption of healthy lifestyles; 8 types of Environmental Risk Factors (Urban Heat Island Effect; soil/air/acoustic/light pollution; vehicular traffic; Safety & Security; weak attractiveness of places); and 14 Healthy Urban Planning Strategies (green/blue/grey infrastructures; biodiversity protection; adverse meteoric events management; public transport systems; vehicular traffic reduction; pedestrian and cycling paths; social and functional mix; urban solid waste's management; renewable energy and efficiency; outdoor spaces lighting; Design for All).

Planetary Health: a public health answer to climate change and other Anthropocene challenges

Chiara Cadeddu

C Cadeddu[1]
[1]Erasmus University, Rotterdam, Netherlands
Contact: cadeddu@eshpm.eur.nl

Although in the last century, humanity achieved extraordinary outcomes in terms of health, social and economic improvements, the Earth ecosystems around us suffer of high levels of degradation. This issue poses our recent public health and development gains at risk. The Anthropocene, a new geological era we are living in since mid 20th century, is indeed characterized by humanity's dramatic impact on Earth's biophysical conditions. Planetary Health is a relatively new field, oriented to solutions, based on transdisciplinarity and social movement, focused on analyzing and addressing the impacts of human disruptions to Earth's natural systems on human health and all life on Earth. In this presentation, a brief overview of the main issues related to the Anthropocene in the public health perspective will be provided and new tools for the analysis of planetary health challenges will be proposed, citing relevant case studies for discussion.

Abstract citation ID: ckae144.701
Climate change perception and mental health: the public health perspective

Vincenza Gianfredi

V Gianfredi[1,2]
[1]Biomedical Sciences for Health, University of Milan, Milan, Italy
[2]Working group of Community mental health, SItI, Rome, Italy
Contact: vincenza.gianfredi@unimi.it

Climate change is increasingly recognized as a critical environmental stressor with significant psychological impacts. Despite consolidated evidence describing the impact of various aspects of climate change on numerous physical and mental health outcomes, a novel and burgeoning area of research is now assessing the association between climate change perception/awareness and health. In fact, the increasing awareness of climate change and its impacts on natural and human systems is not only a matter of environmental concern but also of significant psychological importance. Awareness of climate change involves understanding its causes, foreseeing its long-term global and local impacts, and recognizing the limited window available for effective mitigation and adaptation. This level of awareness, while necessary for proactive behavior, has been linked to various psychological responses, including chronic stress, anxiety, and feelings of helplessness and despair, collectively referred to as 'eco-anxiety.' The association between climate change awareness and mental health is complex and mediated by various individual and social factors. As the reality of climate change becomes more integrated into the public consciousness, it is imperative to address the accompanying psychological impacts. In this presentation, the main issues related to climate change perception/awareness and mental health will be discussed through the lens of public health.

11.F. Scientific session: If we build it, will they come? Evaluation of citywide park redesign and renovation in NYC

Abstract citation ID: ckae144.702

Organised by: Center for Systems and Community Design CUNY (USA)
Chair persons: Terry Huang (USA), Katarzyna Wyka (USA)
Contact: houlin.hong@sph.cuny.edu

Urban environments, such as parks, play a crucial role in shaping the health of their residents. However, the relationship between parks and health remains inconclusive. This workshop will present findings from the Physical Activity and Redesigned Community Spaces (PARCS) Study that examined the community health impacts of the Community Parks Initiative (CPI), a citywide park equity initiative of the New York City Department of Parks and Recreation (NYC Parks) that led to citywide park redesign and renovation across 67 low-income neighborhoods in NYC. Using a quasi-experimental design with socio-demographically matched control parks, we evaluated longitudinal changes in park use, physical activity, and psychosocial well-being as a result of CPI. There will be a total of 3 presentations. The first presentation will focus on the impact of CPI on park use before and after park renovation, relative to control parks, using data collected from the System for Observing Play and Recreation in Communities (SOPARC). Results showed that CPI led to a significant net increase in park use, especially among adults. The second presentation will report on changes in perceived stress pre- and post-renovation among adults. Results showed that a greater decrease in perceived stress was associated with a sustained high or increased park use frequency in the context of high-quality CPI intervention parks. In contrast, the same association was not found in lower quality control parks. The third presentation will showcase a study that demonstrated a significant increase in children's physical well-being, a dimension of quality of life, at CPI vs. control sites. The analysis also showed that children in the lowest socio-economic group might have benefited the greatest from CPI. PARCS is one of the largest intervention studies on the effects of park renovation on health. This workshop will engage participants in considering how these insights can be translated into actionable programs and policies in service of community health and health equity. Findings from PARCS will help inform future public health and urban planning interventions in the use of the built environment to promote population well-being.

Key messages:

- Urban park renovations may contribute significantly to community health, demonstrating a vital link between the built environment and public health.
- Investments in green spaces may enhance the physical and mental well-being of low-income urban communities, promoting social equity.

Abstract citation ID: ckae144.703

Association of park renovation with park use in New York City

Hanish Kodali

HP Kodali[1,2], KE Wyka[1,2], SA Costa[1,2], KR Evenson[3], LR Thorpe[4,2], TTK Huang[1,2]
[1]Center for Systems and Community Design, CUNY Graduate School of Public Health, New York City, USA
[2]NYU-CUNY Prevention Research Center, CUNY Graduate School of Public Health, New York City, USA
[3]Department of Epidemiology, Gillings School of Global Public Health, University, Chapel Hill, USA
[4]Department of Population Health, Grossman School of Medicine, New York Univers, New York City, USA
Contact: hanish.kodali@sph.cuny.edu

Background: Equity-driven citywide park redesign and renovation, such as the Community Parks Initiative (CPI), has the potential to increase park use and opportunities for physical activity in underserved communities. The objective of this study was to evaluate changes in patterns of park use following park redesign and renovation in low-income New York City (NYC) neighborhoods.

Methods: The Physical Activity and Redesigned Community Spaces study was a prospective quality improvement pre-post intervention study design with 33 intervention and 21 matched control neighborhood parks. Data were collected at baseline (prerenovation) and 2 follow-up points (3 months and 1-year post renovation) between 2016 to 2022 summers. Main outcomes encompassed park use and physical activity levels assessed using the well-validated System for Observing Play and Recreation in Communities. Park use was quantified by total number of park users, categorized by age group ($\leq$20 years vs $\geq$ 21 years), sex, and physical activity level (sitting or standing vs walking or vigorous activity). Changes in outcomes between groups were compared via the generalized estimation equation.

Results: A total of 28,322 park users were observed across 1,458 scans. At baseline, 59.7% were 20 years or younger, 46.3% were female, and 43.8% were sitting or standing. Intervention parks showed more net park users compared with control parks from baseline to the final follow-up (difference-in-difference relative rate ratio, 1.69 [95% CI, 1.22-2.35] users/scan). The association was driven by a significant increase in adult users at intervention parks and an overall decrease in all users at control parks.

Conclusions: In this quality improvement study, park redesign and renovation were positively associated with park use in low-income neighborhoods. However, park renovations may need to be accompanied by other programmatic strategies to increase physical activity.

Abstract citation ID: ckae144.704
Frequent park use is associated with reduced stress after citywide park renovation

Rachel Thompson

RL Thompson[1,2], *KE Wyka*[1,2], *TTK Huang*[1,2]
[1]Center for Systems and Community Design, CUNY Graduate School of Public Health, New York City, USA
[2]NYU-CUNY Prevention Research Center, CUNY Graduate School of Public Health, New York City, USA
Contact: rachel.thompson@sph.cuny.edu

Background: Quality parks have the potential to promote well-being in urban communities through reduced stress. The impact of parks on stress may be greater among individuals who use parks frequently. Using pre- and post-renovation data from the Physical Activity and Redesigned Community Spaces (PARCS) study, we evaluated the role of citywide park renovation in the association between park use and perceived stress.

Methods: PARCS evaluated the impact of the NYC Community Parks Initiative, which led to the renovation of dozens of previously disinvested neighborhood parks throughout NYC. Longitudinal data on park use and the Perceived Stress Scale (PSS) from 162 adults residing within 0.3 miles of 31 renovated park sites and 151 adults living near 21 socio-demographically matched control parks were analyzed. Linear mixed-effects difference-in-difference (DID) regression was used to assess the association between park use frequency at follow-up and change in PSS over time in intervention vs. control conditions (2- and 3-way interactions). Models were adjusted for age, education, children in household, marital status, and public housing.

Results: Both intervention and control groups experienced significant declines in PSS over the study period (2016-2022) [Intervention= -2.88 (95% CI -4.10,-1.67), Control=-3.16 (95% CI -4.43,-1.90)]. We found no net difference in change in PSS between the intervention and control groups overall [DID=0.28 (95% CI -1.47,2.03)]. However, there was a significant 3-way interaction of time x park use x intervention ($p < 0.05$). Among participants in the intervention group, those who had high park use at follow-up experienced a significantly larger decrease in PSS compared to those with low park use [DID=-2.92 (95% CI -5.34,-0.49)]. Within the control group, there was no difference in PSS change by park use frequency [DID=1.05 (95% CI -1.48,3.59)].

Conclusions: Park renovation was a pre-condition to the benefit of frequent park use on stress reduction.

Background: Despite increasing interest in the role of parks on children's health, research on the impact of park interventions is limited. This study uses a quasi-experimental pre-post design with matched controls to evaluate the effects of park redesign and renovation on children's quality of life (QoL) in underserved New York City (NYC) neighborhoods with predominantly Hispanic and Black populations.

Methods: Utilizing longitudinal data from the Physical Activity and Redesigned Community Spaces (PARCS) Study, we examined the parent-reported QoL of children aged 3-11 years living within a 0.3-mile radius of 13 renovated parks (N = 201) compared to 11 (N = 197) control parks before and after the park intervention. QoL was measured using the modified KINDL questionnaire, a health-related QoL scale that assessed children's physical and emotional well-being, self-esteem, and well-being in home, peer, and school settings. A difference in difference (DID) linear mixed model was used to compare QoL between intervention and control groups.

Results: We found a significant improvement in the physical well-being subscale of KINDL in the intervention vs. control group (DID=6.35, 95% CI = 0.85-11.85, p = 0.024). The differential improvement was strongest among girls (DID=7.88, p = 0.023) and children with parents in the lowest socioeconomic background (education high school or less DID=8.38, p = 0.024; Not employed DID=7.53, p = 0.048; Single/Widowed/Divorced DID=8.67, p = 0.025). No significant differences were found in other subscales.

Conclusions: Our study indicated a beneficial impact of improving park quality on the physical well-being of children residing in underserved neighborhoods. These findings support investments in neighborhood parks to advance health equity.

Background: The application of polygenic risk score (PRS) in breast cancer (BC) screening presents promising opportunities. Developing recommendations for future use and research on this topic is a key focus of the EU4Health project: Building the EU cancer and public health genomics platform (Can.Heal). We aim to provide these recommendations based on the analysis of available evidence through a transparent and rigorous development process.

Methods: The recommendations adopt the GRADE evidence to decision methodology, leveraging an evidence review team and a multidisciplinary panel of nine experts. A systematic review is being conducted to evaluate the evidence for PRS in BC screening, in the domains of benefits and harms, acceptability, feasibility, equity and cost-effectiveness.

Results: Regarding benefits and harms of adding PRS to BC standard screening, we identified 63 relevant articles. Forty-five (71%) discussed benefits, while 14 (22%) addressed harms. Forty-two (67%) were observational studies, 18 (28%) modeling studies and 1 non-randomised control trial (2%) that examined the diagnostic accuracy of PRS-enhanced screening for relative BC risk prediction using measures such as net reclassification index and area under the curve. Lastly, two modeling studies (3%) assessed the clinical utility of PRS-enhanced screening in terms of life years gained, BC deaths averted. The other domains are under examination. The panel convened to redefine the research question and outcomes of interest and will reconvene to assess the certainty of evidence collected, and subsequently to draft recommendations.

Conclusions: The integration of PRS into BC screening shows potential benefits in improving risk prediction. Ongoing trials, such as Wisdom and MyPEBS, are studying the clinical utility of integrating PRS in BC screening. The approach taken by the Can.Heal aims to ensure that the recommendations are based on a thorough and balanced evaluation of the available evidence.

Key messages:

- The Can.Heal project aims to formulate policy and research recommendations for breast cancer screening using PRS through a thorough evidence review.
- Upcoming PRS recommendations rely on expert opinion and modeling studies.

Abstract citation ID: ckae144.707
Vaginal self-sampling for HPV in the context of cervical cancer screening

Lauma Springe

L Springe[1,2], A Kivite-Urtane[1,2], E Poplavska[1], J Zodzika[3,4], N Berza[4], A Bukova-Zideluna[1,2], A Curkste[1], K Parna[5], A Uuskula[5]

[5]Institute of Family Medicine and Public Health, University of Tartu, Tartu, Estonia
Contact: Lauma.Springe@rsu.lv

Background: Effective cervical cancer screening programme has the potential to improve disease outcomes, yet women's participation rates in Latvia remain suboptimal. Utilizing vaginal self-sampling for HPV, a convenient method, has demonstrated efficacy in boosting participation in under-screened populations. We analysed sociodemographic factors, as well as health behaviours with the preference for vaginal self-sampling procedures for early detection of cervical cancer.

Methods: Cross-sectional survey (2021-2022) included 1313 women in Latvia. Sampling was done in the colposcopy clinic and among GP practices. In the univariate analysis cervical cancer examination preference (self-test or by a physician) was analysed in association sociodemographic factors, participation in the screening, HPV status, study group, and health-related behaviour. Financed by "Internal consolidation of RSU and external consolidation of RSU with LSPA" (No. 5.2.1.1.i.0/2/24/I/CFLA/005), The EU Recovery and Resilience plan and the state budget, Grant Nr. RSU-PAG-2024/1-0016.

Results: 48.6 % (n = 538) of the women would prefer to use a vaginal self-test. Higher odds of the vaginal self-test preference were observed among Latvian (OR = 1.4 (1.1-1.8) vs other nationality women, but no other sociodemographic factors showed statistically significant associations. Women in the colposcopy study group (vs GP practices) were more likely to utilize self-sampling (OR = 1.8 (1.4-2.5). Non-participation in cervical cancer screening was related to 2.4 (1.6-3.6) higher odds of self-test preference, but knowledge about screening was related to 1.5 (1.1-2.0) times higher odds. Women who were HPV-negative were more likely to prefer vaginal self-test for HPV (OR = 1.4 (1.1-1.8) in comparison to HPV-positive women. Health-related behaviour did not show any associations.

Conclusions: Vaginal self-test for HPV can be effectively used to reach under-screened populations and enhance cervical cancer screening coverage.

Key messages:

- The implementation of vaginal self-sampling for HPV testing has the potential to improve participation rates in cervical cancer screening programs among under-screened populations.
- Outreach and education activities tailored to specific target groups in population could enhance level of the cervical cancer screening uptake.

Abstract citation ID: ckae144.708
Urinary artificial sweeteners and breast cancer risk in women from the Moli-sani Study

Marialaura Bonaccio

M Bonaccio[1], A Di Castelnuovo[1], S Costanzo[1], CF Martinez[1], E Ruggiero[1], J Troisi[2], C Cerletti[1], MB Donati[1], G de Gaetano[1], L Iacoviello[1,3]
[1]Epidemiology and Prevention, IRCCS NEUROMED, Pozzilli, Italy

[3]Medicine and Surgery, LUM University "Giuseppe Degennaro, Casamassima (BA), Italy
Contact: marialaura.bonaccio@neuromed.it

Background: Artificial sweeteners (AS) are chemical substances developed by the food industry to reduce sugar and calories while maintaining sweetness. Cohort studies suggested an increased risk of certain cancers, including breast cancer (BC), associated with AS intake, however evidence exclusively relied on self-reported dietary data rather than objectively measured AS. We examined the association of urinary biomarkers denoting AS intake with BC risk in women from the large Moli-sani Study.

Methods: Using a case-cohort design, a sample of 987 middle-aged women (mean age 55±12 y) was randomly selected as sub-cohort and compared with 273 women with incident BC (26 of them also belong to the sub-cohort). A total of 6 commonly used AS (i.e. aspartame, acesulfame, saccharine, sucralose, cyclamate, and steviol glycosides) were measured through liquid chromatography-mass spectrometry in urinary samples (creatinine-adjusted concentrations; µg/mg) collected at baseline (2005-2010). The multivariable hazard ratios (HRs) were estimated through Cox regression models using the Prentice method, where each AS was dichotomized as absence/presence, independent of concentrations.

Results: The main urinary AS was saccharine (E954), contributing to 71% of total AS, followed by steviol glycosides (E960;11%). During a median follow-up of 13.2 y we identified 38 premenopausal and 235 postmenopausal incident BC cases. In multivariable-adjusted Cox analyses, none of the individual AS was associated with overall BC risk, nor was the total urinary AS (HR = 0.93; 95%CI 0.63-1.37 for 1-unit increment). Compared to absence, presence of sucralose (E955) in urine was linked to premenopausal BC (HR = 4.23: 95%CI 1.23-14.51; p = 0.022).

Conclusions: Urinary artificial sweeteners were not associated with BC risk. However, sucralose presence in urine was linked to a higher risk of premenopausal BC. Prospective, dose-related studies with larger sample size are warranted to possibly confirm our findings.

Key messages:

- The presence in the urine of commonly used artificial sweeteners was not associated with breast cancer risk.
- Presence of urinary sucralose was linked to higher risk of premenopausal breast cancer.

Abstract citation ID: ckae144.709
Meal timing and risk of metabolic syndrome in the prospective French NutriNet-Santé biobank

Elena Obeid

E Obeid[1,2], *X Le Folcalvez*[1], *K Ezzedine*[2,3], *A Palomar-Cros*[4], *S Péneau*[1], *A Bellicha*[1], *M Deschasaux-Tanguy*[1], *M Touvier*[1], *VA Andreeva*[1], *B Srour*[1]

[4]Real World Epidemiology Research Group, University Institute for Research in Primary Care, Barcelona, Spain
Contact: elena.obeid@eren.smbh.univ-paris13.fr

Background: Circadian rhythm disruption has been associated with higher risks of cardiometabolic diseases and several cancers. Mistimed eating patterns can desynchronize circadian rhythms, and could therefore influence metabolic health. However, long-term associations between meal timing and the metabolic syndrome remain unclear. The aim of this study was to evaluate the prospective associations between meal timing and the risk of developing metabolic syndrome.

Methods: We used measured biological and clinical data from 16 353 adults (51 years ± 13.72) in the NutriNet-Santé biobank (2011-2014), and examined the associations between meal timing, assessed with repeated 24-hour dietary records during the first two years of follow-up (starting 2009), and the risk of metabolic syndrome, using modified Poisson regression models, adjusted for main confounders.

Results: At the end of follow-up (mean 2.1 years (SD = 1.2)), a later timing of the first meal of the day was associated with a moderately higher risk of metabolic syndrome (1,788 cases; RR per 1-hour delay = 1.05; 95% CI: 1.00-1.10). However, after adjusting for overall diet quality, this association was attenuated (RR: 1.04; 95% CI: 0.99-1.09). Overall, we found no evidence of an association between the occurrence of metabolic syndrome and the time of the last meal (RR: 0.99; 95% CI: 0.95-1.05), the number of eating occasions (RR: 1.00; 95% CI: 0.98 - 1.03), or night-time fasting duration (RR: 1.03; 95% CI: 0.99 1.07).

Conclusions: In this large prospective study, timing of the first meal showed modest associations with metabolic syndrome. Further investigations using a longer follow-up are needed to elucidate how meal timing influences metabolic health.

Key messages:

- Beyond the nutritional quality of meals, meal timing, particularly time of first meal, may be an accessible prevention strategy for metabolic health.
- More largescale prospective and intervention studies are needed to better understand the links between meal timing and metabolic health.

Exposure to food additive mixtures and type 2 diabetes risk in the NutriNet-Santé cohort

Marie Payen de la Garanderie

M Payen de la Garanderie[1], *N Deschamp*[1], *A Hasenböhler*[1], *G Javaux*[1], *F Szabo de Edelenyi*[1], *C Agaësse*[1], *A De Sa*[1], *M Deschasaux-Tanguy*[1], *B Srour*[1], *M Touvier*[1]
[1]EREN, Université Sorbonne Paris Nord, INSERM, INRAE, CNAM, CRESS, Bobigny, France
Contact: marie.payen-de-la-garanderie@eren.smbh.univ-paris13.fr

Background: So far, the safety evaluation of food additives has been performed substance by substance, while in real life, millions of individuals are exposed to mixtures of food additives daily. According to preliminary experimental data, some of these chemicals, alone and/or in synergy are suspected to impact metabolic health. The objective of this study was to investigate for the first time the associations between exposure to mixtures of food additives and type 2 diabetes (T2D) risk in a large prospective cohort of French adults.

Methods: Participants (n = 108,783, 79.2% women, mean age=42.4 years, SD = 14.6) from the NutriNet-Santé cohort (2009-2024) completed repeated 24h-dietary records, detailing industrial product brands. Additive exposure was assessed using composition databases and laboratory assays. Five mixtures of additives were identified through non-negative matrix factorisation (NMF). Associations between these mixtures and the risk of T2D were characterised using multivariable proportional hazards Cox models adjusted for known risk factors.

Findings: 1115 participants were identified with T2D during follow-up. Two additive mixtures were associated with increased T2D risk. The first mixture included higher exposure to modified starches E14xx, pectins E440, guar gum E412, carrageenan E407, and polyphosphates E452 (HRper 1SD increment=1.11 [1.05-1.18]), $p < 0.0001$). The second mixture comprised citric acid E330, sodium citrates E331, phosphoric acid E338, sulphite ammonia caramel E150d, acesulfame-K E950, aspartame E951, sucralose E955 and arabic gum E414 (HR1SD=1.13 [1.08-1.18]), $p < 0.0001$).

Interpretation: This large prospective cohort study revealed direct associations between T2D risk and exposure to two food additive mixtures. Molecular epidemiology and experimental studies will be necessary to depict underlying mechanisms and potential cocktail effects.

Key messages:

- Consumed together, widely used food additives may contribute to T2D aetiology, shedding light on the detrimental impact of highly processed foods on metabolic health.
- This study highlights positives associations between T2D risk and exposure to two food additive mixtures.

Abstract citation ID: ckae144.711
Can mobile apps facilitate more sustainable and healthier diets? A systematic review

Esther Curtin

E Curtin[1], *R Green*[1], *KA Brown*[2], *P Scheelbeek*[1]
[1]Department of Population Health, LSHTM, London, UK
[2]Faculty of Health & Life Sciences, University of Exeter Medical School, Exeter, UK
Contact: esther.curtin@lshtm.ac.uk

Background: One third of all greenhouse gas emissions come from the food system, and current diets are insufficient to meet environmental and public health goals. Digital health apps offer promise to change behaviour, but little is known about the effects of different types of apps. This systematic review assessed the effectiveness of mobile apps in facilitating dietary changes across adults from high-income countries.

Methods: Seven electronic databases (MEDLINE, EMBASE, PsycINFO, CINAHL, Global Health, GreenFILE, Web of Science), two trial registries (Cochrane Trials and Clinicaltrials.gov), and Google were systematically searched for intervention studies aiming to facilitate dietary change. Interventions were characterised by their use of messaging (e.g., motivational statements) and personalised features (e.g., tailored nutrition advice). Outcomes for three food groups were synthesised through meta-analysis.

Results: Of the 5261 identified records, 21 met the eligibility criteria and were included. Interventions, recruiting 73,973 participants in total, lasted from three days to six months. Overall positive changes were observed in daily servings of fruit and vegetables (0.59, 95% CI 0.20, 0.99), legumes (0.05, 95% CI 0.01, 0.08), and meat (-0.14, 95% CI -0.23, -0.05), remaining significant after removing non-randomised controlled trials. Changes in fruit and vegetable intake were more pronounced for users of apps with messaging components (0.75, 95% CI 0.18, 1.32) and personalisation (0.67, 95% CI 0.16, 1.19), and meat intake changes were larger for messaging-based apps (-0.21, 95% CI -0.27, -0.15) than apps without these features.

Conclusions: Our findings suggest to practitioners and policymakers that mobile apps could be a useful and innovative way to change behaviour. Within a wider behaviour change approach, apps could help facilitate diets that meet food-based dietary guidelines, are predominantly plant-based, and are protective of environmental and human health.

Key messages:

- Overall, the results from 21 studies showed positive dietary changes towards more fruits, vegetables, and legumes and less meat consumption following the use of mobile apps.
- Apps including messaging and personalised elements appeared most effective and may be important for driving changes in fruits, vegetables, and meat consumption.

Abstract citation ID: ckae144.712
What is driving food insecurity risks in UK households with children?

Rosalyn Arnold

R Arnold[1], *D Taylor-Robinson*[1], *D Hargreaves*[2], *R Loopstra*[1]
[1]Department of Public Health, Policy and Systems, University of Liverpool, Liverpool, UK
[2]School of Public Health, Imperial College London, London, UK
Contact: rosalyn.arnold@liverpool.ac.uk

Background: Food insecurity is a global public health issue, disproportionately affecting households with children in the UK. Despite increased research attention, there remains a gap in understanding why prevalence of food insecurity is higher in this demographic. This study aims to address this gap.

Methods: Utilising data from the 2021/22 and 2022/23 Family Resources Survey, an UK annual cross-sectional survey, we investigate the association between sociodemographic and economic factors, and the risk of food insecurity among households with children. Logistic regression analysis was used, with food security treated as a binary outcome variable. Control variables included receiving means-tested benefits, disabilities in a household, region within the UK, and the ethnicity, highest education level and marital status of the household reference person. A total of 41127 households were included, with 10137 being households with children.

Results: Our preliminary findings reveal stark inequalities, with 12.0% of households with children experiencing food insecurity, compared to 6.4% of households without children (p-value for comparison <0.0001). After adjusting for control variables, the odds of food insecurity among households with children was 1.40 (95% CI: 1.27, 1.54) compared to households without children. Adding equivalised household income after housing costs attenuated the relationship but households with children remained at significantly higher odds of food insecurity (OR: 1.32 (1.20, 1.45)).

Conclusions: This preliminary analysis demonstrates that, after adjusting for control variables and equivalised household income after housing costs, having children in a household is still associated with a higher risk of food insecurity. This underscores the need to understand the mechanisms underlying this relationship further. Such insights are essential for informing targeted policies and interventions aimed at mitigating food insecurity among households with children.

Key messages:

- Having children independently increases the risk of food insecurity in households in the UK.
- Moving forward, our aim is to understand the mechanisms underlying the relationship between households with children and food insecurity.

Abstract citation ID: ckae144.713
Impact of the COVID-19 pandemic on food choices among the working-age adult residents of Lithuania

Rokas Arlauskas

R Arlauskas[1], *D Austys*[1], *R Stukas*[1]
[1]Public Health, Vilnius University, Vilnius, Lithuania
Contact: rokas.arlauskas@mf.vu.lt

Background: The COVID-19 pandemic affected the nutrition of various populations. Assuming that the majority of the population of working-age residents of Lithuania know healthy nutrition recommendations and that food selection criteria might serve as an indicator of the following them, we aimed to assess the food selection criteria during and after the COVID-19 pandemic among working-age adult residents of Lithuania.

Materials and methods: Three cross-sectional surveys among working-age adult residents of Lithuania were carried out: in 2019 (before the pandemic), in 2021 (during the pandemic), and in 2022 (after the pandemic). In 2019, this study included 1007 residents, 1600 residents were surveyed in 2021, also, 1600 residents were surveyed in 2022. Distribution of the respondents by food selection criteria was compared between the samples according to gender, age, marital status, education level, place of residence, employment, income.

Results: The COVID-19 pandemic affected the food choices of Lithuanian residents ($p < 0.05$). In 2019, products' benefits for health criterion was in the third place when choosing foods. It was indicated by 22% of the respondents. In 2019, the most prevalent criterion for selecting foods was taste. It was indicated by 37% of the respondents. The second most prevalent food selection criterion was the price. It was indicated by 24% of the sample. In 2021 selection of foods because of products' health benefits became the most prevalent and accounted for 31% of the sample. In 2022, it returned back to the prepandemic level and accounted for 19% of the sample. In all social and demographic groups changes in food selection criteria remained as well ($p < 0.05$).

Conclusions: The COVID-19 pandemic had a positive impact on the food choices of working-age adult residents of Lithuanian. Changes of food selection criteria were observed within the different groups of gender, age, marital status, education level, place of residence, employment, income.

Key messages:

- The COVID-19 pandemic had a positive impact on the food choices of working-age adult residents of Lithuanian.
- Less than a year after the pandemic food selection according to its health benefits rapidly decreased and returned back to the prepandemic level.

11.H. Round table: Making the case for public investment in health

Abstract citation ID: ckae144.714

Organised by: European Observatory on Health Systems and Policies
Chair persons: Rebecca Forman (UK), Jonathan Cylus (WHO)
Contact: formanr@obs.who.int

Across the European Union (EU), public budgets are facing pressures and policy makers are becoming increasingly concerned about how to adequately and sustainably fund their health systems to keep up with need and demand. In recognition of this, in 2022 a Technical Support Instrument (TSI) project funded by the Directorate-General for Structural Reform Support (DG REFORM) was launched together with three European Union (EU) Member States with the goal of strengthening capacity to make the case for public investments in health. To support these efforts, the European Observatory on Health Systems and Policies (OBS) conducted an exercise to map relevant analytical approaches and tools for making the case for public investment in health. As a contribution to this workshop, OBS will present the key results from this exercise, including a framework that has been designed to support health policy makers, advisors and advocates by providing five key lines of argument and selected examples of tools, data, indicators and methods that can be used to successfully make the case for public funding for health. This will be complemented by two presentations on country experiences (in Austria and Malta) of navigating negotiations between health and finance and securing public funding for health. These will highlight both successes and challenges in practice. By looking at examples from MS on making the case for public investment in health, these presentations will frame the panel discussion that follows. The chairs will facilitate a discussion closely engaging the audience on how to build better narratives and exchanges which facilitate trust and alignment between health and finance stakeholders in the pursuit of strengthening the capacity to make the case for public investment in health. The workshop will highlight five lines of argument and practical examples of tools, data, indicators and methods that can be used to support the case for public investment in health. It will also focus on the important enablers (e.g. cooperation, communication, transparency, accountability, trust) for successful budget negotiations and discuss how these can be facilitated.

Key messages:

- Budget cases for public funds for health tend to be most successful when they align well with the goals and objectives of finance stakeholders, and certain narratives and arrangements can foster this.
- Data and evidence can help steer decision makers to make good choices (or at least avoid bad ones), but other factors serve as the fuel to push the budget case for health forward successfully.

Extrapulmonary tuberculosis (EPTB) presents with nonspecific symptoms which can pose a diagnostic challenge. Currently, there are no clear predictors for EPTB. We aimed to identify these factors for better diagnosis and disease control. We included tuberculosis cases reported in Frankfurt from 2008-2023, with available clinical and whole genome sequencing data. According to WHO criteria, cases with pulmonary or combined pulmonary and extrapulmonary symptoms were categorised as pulmonary tuberculosis, while exclusively extrapulmonary symptoms were categorised as extrapulmonary tuberculosis. We assessed the association between EPTB and M. tuberculosis lineage, comorbidities and demographic characteristics using logistic regression, calculating crude and adjusted odds ratios (aOR). Of the 1035 reported tuberculosis cases, 272 had exclusively extrapulmonary disease and 136 had both pulmonary and extrapulmonary disease. In the univariable analysis, lineages 1 and 3 were significantly associated with extrapulmonary disease compared to lineage 4. However, this association was not observed in the multivariable analysis. In the final regression model, females were more likely to develop EPTB than men (aOR: 1.65, CI: 1.19-2.27). The odds of developing extrapulmonary disease were higher among patients born in the South-East Asian (aOR: 6.48, CI: 3.72-11.43) and Eastern Mediterranean (aOR: 5.54, CI: 3.41-9.11) than in other regions. Among the comorbidities, diabetes was found to be negatively associated with extrapulmonary disease (aOR: 0.50, CI: 0.26-0.91). Our results indicate that host factors such as geographic origin and sex are stronger predictors for extrapulmonary presentation of tuberculosis than a specific lineage. We recommend increasing physicians' awareness of the nonspecific presentation of EPTB and adapting screening programmes, particularly for patients from South-East Asian and Eastern Mediterranean regions to foster more effective tuberculosis control measures.

Key messages:

- Our study highlights the importance of considering host factors in predicting extrapulmonary tuberculosis, indicating their stronger influence compared to specific M. tuberculosis lineages.

- Increased physicians' awareness of the nonspecific symptoms of EPTB and targeted screening programs for high-risk populations are crucial for enhancing tuberculosis control measures.

Background: Influenza pandemic preparedness plans should be adopted, regularly updated in every country, and comply with international guidelines to ensure proper management of public health emergencies. In Italy, each region develops its pandemic plan based on a National Plan. This study, conducted within a project funded by the Italian Ministry of Health, aims to assess the level of compliance of these plans with the national guidelines.

Methods: The assessment was based on a checklist of 192 items reporting the actions prescribed by the national plan. The items were divided into macro-areas by pandemic phase: general, alert, inter-pandemic, pandemic, and transition. The compliance regarding the presence and contextualization of each item in the regional plans was evaluated. Each macro-area was further assessed for easy identification of actions, congruence with the National Plan, and contextualization in the regional healthcare system. Some analyses grouped the regions into North, Centre, and South/Islands.

Results: Some macro-areas, such as 'Communication' and 'Prevention and Control measures,' showed some weaknesses in all phases, especially in the northern regions, which reached levels of full compliance below 50%. Central regions were highly compliant in almost all macro-areas, especially in 'Strategy/Governance' (100%), 'Supplying' (75-100%), and 'Surveillance' (75-100%). Overall, contextualization was the weakest aspect in all phases, while easy identification and congruence were mainly better achieved. Only three regions fully met all the assessed parameters.

Conclusions: A strict surveillance and monitoring process of planned activities is necessary to strengthen the country's preparedness. This study identified critical issues and key areas for improvement at the regional level. This might allow us to verify the correct implementation of national guidelines and define the best strategies for improving readiness for public health emergencies in the future.

Key messages:
- Implementation of the Italian influenza pandemic plan was uneven across regions.
- Identification of lacking areas of the regional implementation is essential to improving national preparedness.

Contact: lin.jiang@ntnu.no

Background: Evidence on the association between serum vitamin D levels and incidence of atrial fibrillation (AF) was inconclusive. To elucidate the nature of the association, we studied the relationship between serum 25-hydroxyvitamin D (25(OH)D) levels and AF incidence in the Norwegian Trøndelag Health (HUNT) Study using both conventional observational and Mendelian Randomization (MR) approaches.

Methods: 3394 adult participants without AF diagnoses were followed up from HUNT3 (2006-2008) to 2021 in a prospective cohort. Average serum 25(OH)D levels over ten years between HUNT2 (1995-1997) and HUNT3 were calculated and categorized into <50 and ≥ 50 nmol/L as exposure. AF diagnoses were retrieved from hospital registers and validated by medical doctors. Cox regression was used to calculate hazard ratios (HR) and 95% confidence intervals (CI). Furthermore, a one-sample MR was conducted among 36,554 adults who participated in both HUNT2 and HUNT3. An externally weighted genetic risk score based on 19 vitamin D-related genetic variants, chosen for their clear biological functions in serum vitamin D transport, synthesis and metabolism, was used as instrument. We applied the Wald ratio method to assess the causal effect.

Results: During a median 13-year follow-up, 303 AF cases were diagnosed in the prospective cohort. Serum 25(OH)D level <50.0 nmol/L was associated with a 26% reduced incidence of AF (HR 0.74, 95% CI 0.58 to 0.95), compared to serum 25(OH)D ≥ 50 nmol/L after adjustment for confounders. Genetically determined 10 nmol/L decrease in serum 25(OH)D level was associated with a 7% reduced incidence of AF (HR 0.93, 95% CI 0.86 to 1.00) in the MR analysis. Sensitivity analyses supported this positive association.

Conclusions: We found a consistent positive association between serum 25(OH)D level and AF incidence in the Norwegian HUNT population using both observational and MR approaches.

Key messages:
- Serum vitamin D levels appeared to be positively associated with the incidence of AF.
- Vitamin D supplementation should be prescribed with caution, especially for people at high risk for AF.

Contact: burkeeb@tcd.ie

Background: The COVID-19 pandemic highlighted the need to improve preparedness for emerging health threats. This includes reserving assets for use in health emergencies, such as, shelters, energy supply items, and a stockpile of medical countermeasures (MCMs). Learnings from the recent pandemic are key to improving future strategies for preparedness in Ireland and across Europe.

Methods: Semi-structured interviews were conducted with key representatives in France, Latvia, Lithuania, the Netherlands, and Norway. These countries were chosen as they have a similar threat profile to Ireland. The interviews aimed to understand the national approach taken in each country to stockpiling of MCMs for public health emergencies. Interview summaries were developed and reviewed by key representatives for clarity. Thematic analysis was conducted.

Results: All of the key representatives interviewed were working within their associated Department of Health, or a government affiliated public health agency. Themes and key findings identified included scope and current stockpiling approaches; cost considerations and efficiency, and an understanding of how stockpiling approaches have evolved overtime. While some countries stockpiled items such as facemasks, gloves and ventilators during the COVID-19 pandemic, this is being reviewed, due to the high costs involved. Additionally, all countries reported that waste due to unused stock was a challenge, however, the use of stock rotation can reduce stock waste. Choice of supplier is also key for security of supply. Using indigenous suppliers can facilitate a scale up of supply in times of crises.

Conclusions: National MCMs stockpiles are a key resource that may be deployed as part of a response to health emergencies and disasters. Reducing waste was a key priority and challenge for all countries. Measures identified to reduce waste in future included active management of stockpiles, stock rotation and the use of indigenous suppliers.

Key messages:

- As a result of the COVID-19 pandemic, many countries are reviewing their current approach to stockpiling.
- Key issues for countries included preventing waste and ensuring security of MCM supply.

11.K. Scientific session: Roots of public health: school health literacy to enhance population health outcomes in Europe

Abstract citation ID: ckae144.719

Organised by: EUPHA-HL, -DH, -HP, -ETH, -CAPH, London South Banks University (UK), Technical University of Munich (Germany), WHO Collaborating Centre for Health Literacy
Chair persons: Catherine Jenkins (UK), Orkan Okan (EUPHA-HL)
Contact: orkan.okan@tum.de

This workshop will present empirical results from three representative studies on health literacy and digital health literacy conducted in primary and secondary schools in Wales and Germany: (1) Digital Health Literacy in Schools, (2), HLCA HL-Kids, (3) WHO HBSC Wales. While research on child and adolescent health literacy has gained traction in the past decade, only a few studies focus on health literacy in schools. While the European Commission and WHO, as well as most European governments, highlight the importance of schools to support children's health literacy, schools remain neglected as a research context. With only little evidence available, it is difficult to derive strategies and programs to promote health literacy in schools. We aim to provide practical novel knowledge and contribute to closing the school health literacy gap that is prevalent in Europe. In turn, this will also contribute to European public health development and population health outcomes. Levels of health literacy in child and adolescent populations across European countries and age groups are alarmingly low, making low health literacy a severe risk factor for health outcomes. Low health literacy is associated with worse health conditions and unhealthy behaviours, and in turn, impacts school attainment and educational outcomes. Evidence suggests that health literacy acts as a determinant of health and itself is influenced by other social determinants of health, such as education, intertwining health and education. All studies conducted so far provide evidence that low health literacy follows a social gradient, with children from less affluent families being more likely to have lower health literacy, widening preexisting health inequities observed in almost all health domains within Europe. While effective interventions on the individual and system levels are needed to enhance health literacy, implementation and evaluation research concerning children's health literacy is rare.

Workshop objectives: The aim of this workshop is to present findings from three representative studies on health literacy and digital health literacy in primary and secondary schools:

(i) The 1st speaker will introduce a study on health literacy and health behaviours of children aged 8-11

(ii) The 2nd speaker will discuss the influence of living environments on health literacy in 4th-grader school kids

(iii) The 3rd presentation will have its focus on navigating the infodemic through digital health literacy in adolescent students

(iv) The 4th speaker will show links between digital health literacy and health behaviour in adolescent students

The format of this workshop will be 4x10-minute presentations followed by a 20-minute panel discussion with the audience, reflecting the relevance of the results to public health research, practice, and policy. The chairs will provide a brief introduction to the concept and moderate the presentations and panel discussion.

Key messages:

- Our results show that health literacy should be addressed as early as in primary schools and that the places, households, and environments children grow up are critical social determinants of health.
- Digital health literacy has proven to be a valid learning topic in secondary schools and is linked to digital and media literacy, allowing us to define it as a targeted curriculum item.

Contact: E.K.Marchant@swansea.ac.uk

Background: Health literacy (HL) is a modifiable factor contributing to the promotion and maintenance of health and well-being throughout an individual's life. Identified as a priority in Wales, UK in 2010, progress has since stalled despite health and education as national policy priorities and international policy growth. There is a gap in understanding of children in Wales' HL needs, particularly below adolescent age ($<=$11 years).

Methods: This study aimed to scope a measure of children's HL to be integrated into the existing HAPPEN Cohort Study survey, which collects self-reported health behaviours of children aged 8-11. A review identified the Health Literacy of School-Aged Children (HLSAC) tool which conceptualises health literacy as a learning outcome. A convenience sample of n = 15 primary schools were recruited in April 2023 through HAPPEN and n = 669 school children n = 669 completed the online survey between May-June 2023.
Results: Preliminary data using sum HLSAC scores show a proportion of children with low (20.5%), moderate (52.8%) and high HL (26.8%). Independent samples t-tests comparing mean HLSAC scores with binary self-reported health behaviours show higher HL scores for weekly behaviours ($p < 0.05$); feeling less tired (0-4 days: 15.1+-4.1, >=5 days 14.5+-3.4), can concentrate (0-4 days: 14.3+-3.6, >=5 days: 15.5+-4.0) and consume less fizzy drinks (0-4 days: 15.0+-3.9, >=5 days: 14.0+-3.8). Further, for can ride a bike (no: 14.3+-4.0, yes: 15.0+-3.9), can swim 25m (no: 14.6+-3.7, yes: 15.1+-4.0), someone active in the household (no: 14.3+-3.8, yes: 15.2+-4.0) and higher health well-being (<7/10: 13.9+-3.5, >=7/10: 15.3+-3.9). This preliminary data will be strengthened with further analyses including regression.
Conclusions: Associations appear between various important health behaviours spanning physical activity, nutrition, cognition and well-being. Capturing children's HL and health behaviour needs enables targeted health promotion and education activities.

The influence of living environments on subjective health literacy in fourth-graders in Germany

Torsten Michael Bollweg

T Bollweg[1,2], *O Okan*[1,2]
[1]School of Medicine and Health, Technical University of Munich, Munich, Germany
[2]WHO Collaborating Centre for Health Literacy, Technical University of Munich, Munich, Germany
Contact: torsten.bollweg@tum.de

Background: Evidence suggests that worse family affluence is related to low health literacy in children. Still, for the targeted promotion of health literacy, a more nuanced understanding is needed of how living environments affect health literacy in early life. This study explores the relationships between health literacy and indicators of living environments in the neighborhood and at home.
Methods: A representative sample of 4th-graders (age 8-11) was surveyed from Oct. 2022 to Feb. 2023 in North Rhine-Westphalia, Germany. We included the HLS-Child-Q15 to assess subjective health literacy, 4 items about the neighborhood (e.g., "neighborhood is a good place to play outside" or "I often see people smoking in the neighborhood"), and 4 items about home (e.g., "there's always fruit and vegetables at home" or "it's important to my parents that I exercise"). The tendency to answer in a socially desirable way was controlled for with a validated scale. Likert-scale items were dichotomized for use in linear regression.
Results: n = 1085 students are included, 50.3% are female. The mean age is 9.5 years (SD=.6). The regression model explains 17.8% of variability in health literacy (corr. R^2). Significant ($p<.05$) predictors for high health literacy were birthplace (Germany, not Germany), agreement to the statements "I often see people exercising in my neighborhood", "my parents can answer all my question about health", "there's always fruit and vegetables at home", "it's important to my parents that I exercise", but also social desirability scores. Family affluence was not a significant predictor.
Conclusions: In this sample of 4th-graders, subjective health literacy could not adequately be explained by family affluence. Indicators of living environments seem to be better suited to explore variability in health literacy. These findings can be used to explore entry points for the promotion of health literacy early in life and to identify groups at risk for low health literacy.

Background: High digital health literacy (DHL) can help to navigate the internet's vast information landscape. This research explores the impact of learning DHL in schools on students' DHL, and how it might mitigates confusion surrounding health-related information. Moreover, this research sheds light on how learning DHL in schools influences students' inclinations towards specific sources of health information.
Methods: 1448 secondary school students aged 9-18 years participated in face-to-face interviews. Associations between learning digital health literacy (DHL) and students' DHL, comprehension of health information, sense of being informed on health topics, and utilization of diverse health information sources were evaluated using the chi-squared test.
Results: The learning of DHL within school settings demonstrated a significant correlation with students' overall DHL (X2 (6) = 120.99, $p < .001$). Those reporting high levels of DHL learning exhibited reduced confusion regarding health information (X2 (4) = 16.65, $p = .002$) and felt notably more informed (X2 (4) = 231.06, $p < .001$). Contrasted with peers who reported insufficient learning of DHL, students with high learning reported learning more about health from parents (X2 (2) = 55.28, $p < .001$), peer interactions (X2 (2) = 214.51, $p < .001$), online sources (X2 (2) = 78.54, $p < .001$), influencer content (X2 (2) = 68.46, $p < .001$), offline literature (X2 (2) = 24.32, $p < .001$), television (X2 (2) = 140.36, $p < .001$), and in school (X2 (2) = 205.53, $p < .001$). However, they were less reliant on physicians for health information (X2 (2) = 53.62, $p < .001$).
Conclusions: Integrating DHL into school curricula holds promise for enhancing students' DHL and alleviating apprehensions regarding health-related information. Moreover, such educational initiatives have the potential to expand students' repertoire of resources for accessing health information, encompassing both digital and non-digital sources.

Contact: lisa.stauch@tum.de

Background: Health information is increasingly available and plays a crucial role in making health decisions and developing healthy behaviours. Digital health literacy (DHL) enables one to distinguish between true and false health information online. Studies have found higher health literacy to be associated with healthier behaviour. However, there is no research on child DHL and health behaviour. This study aims to investigate the relationship between DHL and selected health behaviour of schoolchildren in Germany.
Methods: This cross-sectional study is based on a representative sample of ($N = 1448$) secondary schoolchildren (aged 9-18 years) in Germany across all 16 federal states and school forms. DHL was assessed using the child and adolescent version of the Digital Health Literacy Instrument developed and pretested in this study. Selected health behaviours (eating, teeth brushing, smoking, and alcohol consumption) were measured using self-report scales. Chi-square tests were conducted to measure differences between DHL and health behaviour.
Results: Associations were found between DHL and all eating behaviours (fruits; vegetables and salad; whole-grain products; other animal-based products; chocolate or other sweets; sugary drinks; fast food), except for eating meat and sausages. Schoolchildren with higher levels of DHL reported more often about regular consumption of fruits and vegetables (X2 (2)=17.06, $p = <.001$). salads (X2 (2)=56.54 $p = <.001$) and whole-grain-products (X2 (2)=98.81 $p = <.001$). While DHL was associated with teeth brushing (X2 (2)=44.46, $p = <.001$), no differences were observed for smoking (X2 (2)=1.93, p=.381) and drinking alcohol within the last 30 days (X2 (2)=2.62, p=.270).
Conclusions: These findings indicate that most health behaviours of schoolchildren may benefit from enhancing DHL in schools. Programs should build around these topics. However, more research is needed to investigate associations between DHL and health behaviours comprehensively.

11.L. Round table: Fiscal measures for building resilient European health systems

Abstract citation ID: ckae144.724

Organised by: Ecorys, EUPHA-PHPP, -ECO
Chair persons: João Vasco Santos (EUPHA-ECO), Marleen Bekker (EUPHA-PHPP)
Contact: rana.orhanpees@ecorys.com

Currently, over 100 million European citizens are affected by obesity and non-communicable diseases. These health conditions impact individuals and society economically as well as socially. Therefore, an increasing number of Member States has introduced taxes on foods high in fat, sugar, or salt. However, divergent national fiscal health measures can lead to market distortion or fraudulent activities, revealing that, although the responsibility for implementing fiscal measures lies with national governments, health systems of different Member States are much interlinked. The increasing health risks for European citizens and its broader impact underline the importance of resilience in European health systems more than ever before, calling for early response and effective concrete actions from both EU institutions and national governments. Additionally, the topic of resilient health systems currently ranks high on the European agenda, with the Belgian Presidency promoting health system preparedness and early response and health care strengthening as one of their six priorities. The European Commission will also continue its work on this issue for the next five years. The EU has already taken steps in this matter, such as the launch of the European Health Union and the creation of HERA. However, in order to preserve a healthy society, the EU must further develop in this regard. Therefore, this round table discussion will focus on the question of how fiscal measures in Member States can contribute to resilient health systems. It aims to generate ideas on how Ministries of Health can contribute to resilient health systems via fiscal measures compatible with European Community law that promote health and prevent disease. Panellists from the WHO Regional Office for Europe, the Hungarian Ministry of Health and Ecorys, a research-based consultancy, will provide diverse perspectives on the topic. The added value of the round table is laying out possible ways of how both the EU and Member States can contribute to enhancing the resilience of European health systems. In the discussion, knowledge is derived from various research projects, such as Ecorys' study for DG TAXUD on health taxes, their study for the Dutch Ministry of Finance on sugar taxes, and their literature study on sugar taxation and VAT reduction on fruits and vegetables. Furthermore, as an example of alternative funding mechanisms for resilient health systems, the Hungarian approach to health taxes will be reviewed, since a portion of the tax revenue from their public health tax is used to finance public health initiatives. From a policy perspective, the round table will aid in formulating recommendations for improving the resilience of EU health systems for the next five years.

Key messages:
- Unhealthy foods and drinks consumption poses significant health risks, impacting economy and society, and requiring evidence-based fiscal measures as part of comprehensive measures.
- The round table provides public health stakeholders the opportunity to generate recommendations for improving the resilience of EU health systems for the next five years.

Speakers/Panelists:

11.M. Oral presentations: Mental health, social security and work

Abstract citation ID: ckae144.725

Parental leave benefit levels and postpartum maternal mental health: a Swedish cohort study

Amy Heshmati

A Heshmati[1,2,3], H Honkaniemi[1,2], S Fritzell[3], SP Juárez[1,2,3]
[1]Centre for Health Equity Studies, Stockholm University, Karolinska Institutet, Stockholm, Sweden
[2]Public Health Sciences, Stockholm University, Stockholm, Sweden
[3]Global Public Health, Karolinska Institutet, Stockholm, Sweden
Contact: amy.heshmati@su.se

Background: While generous parental leave benefits are protective for postpartum maternal mental health, not all mothers qualify for these benefits due to strong work requirements. Sweden offers paid parental leave to all residents, but the benefit level depends on their salary and labour market attachment.
Objectives: To evaluate the association between parental leave benefit levels and maternal mental health in the postpartum period.
Methods: Using total population register data, we studied 210 800 first-time mothers, aged 18-52 years, who gave birth to a live singleton offspring in Sweden between January 1, 2007 and December 31, 2011. We performed multivariable logistic regression to compare odds of mental health outcomes from different levels of severity (prescribed anti-depressants or anxiolytics, specialist outpatient care and hospitalisation) between mothers receiving higher-level benefits (i.e., qualified for earnings-related benefits) and those with basic benefits (i.e., a low flat-rate level). We also performed decomposition analyses using the Karlson-Holm-Breen method, and subgroup analyses by region of birth.
Results: Mothers receiving basic benefits had increased odds of prescribed antidepressants or anxiolytics (OR 1.44 95% CI 1.37-1.51), specialist outpatient care (OR 2.27 95% CI 2.13-2.44), and hospitalisations (OR 2.47 95% CI 2.97) compared with mothers receiving higher-level benefits. Increased odds remained after adjustment for pre-existing mental health. After further adjustment for income and employment status, the odds remained elevated for specialist outpatient care (OR 1.13, 95%CI 1.02-1.24) and hospitalisation (OR 1.34, 95%CI 1.03-1.76).
Conclusions: Mothers with basic benefits are more likely to experience moderate-to-severe mental disorders compared to mothers with higher-level benefits, independent of pre-existing mental health, income and employment status.
Key messages:

- Labour market attachment prior to childbirth affects parental leave benefit levels and plays an important role in determining mental health outcomes in the postpartum period.
- The work requirements for more generous parental leave benefits may prevent mothers from benefiting from the protective mental health advantages of parental leave.

Abstract citation ID: ckae144.726

The role of mental health-related healthcare use in employment and benefits use after unemployment

Laura Salonen

L Salonen[1], T Leinonen[1], S Solovieva[1]
[1]Finnish Institute of Occupational Health, Helsinki, Finland
Contact: laura.salonen@ttl.fi

Background: Mental health problems are common among unemployed job-seekers and they further hinder successful re-employment. Previous studies investigating the role of mental health problems on labour market participation after unemployment have largely focused on a single outcome. However, many have subsequent unemployment or receive different types of benefits. To understand these complex pathways a more comprehensive approach is needed. In this study, we examine how mental health-related healthcare use among the unemployed affects their employment and benefit use trajectories.
Methods: We use a 90% population sample of individuals who were residing in Finland at the end of 2010, who were 25-59 years old and unemployed between 2014-2016 (n = 596,323). We use multistate trajectory models to analyse their employment and benefits use development three years after the onset of unemployment. We will further use multinominal regression analysis to investigate how mental health-based healthcare use is associated with these trajectories and how this association varies between different sociodemographic groups.
Results: Around half of the unemployed job-seekers received some type of benefit after the onset of unemployment. Almost 25 % received sickness allowance (especially women), a little less social assistance (especially young and low educated), or unemployment benefits (especially men), and around 10 % received disability pension (especially among those with healthcare visits due to mental disorders). Next, we will conduct a trajectory analysis to get a more comprehensive picture of the employment and benefits trajectories.
Conclusions: Unemployment is followed by complex employment and benefits trajectories which further differ by sociodemographic groups and mental health-related healthcare use. Knowledge on the factors influencing these trajectories will help direct employment-promoting interventions towards different groups of unemployed.
Key messages:

- Many unemployed job-seekers receive some type of social or sickness benefit after unemployment.
- The employment and benefits trajectories after unemployment differ between those who had mental health-related healthcare use and those who did not, and further by sociodemographic factors.

Abstract citation ID: ckae144.727

Joint associations of psychological distress and working conditions with sickness absence in Finland

Anna Svärd

A Svärd[1], ML Kalima[1], JI Halonen[2,3], M Mänty[1,4], E Roos[1], J Salmela[1], T Lallukka[1]
[1]Department of Public Health, Faculty of Medicine, University of Helsinki, Helsinki, Finland
[2]Department of Health Security, THL, Helsinki, Finland
[3]Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Sweden
[4]Department of Strategy and Research, City of Vantaa, Vantaa, Finland
Contact: anna.svard@helsinki.fi

Background: Psychological distress has increased remarkably, especially among younger age groups, during the last years. Both psychological distress and exposure to strenuous working conditions are known risk factors for sickness absence (SA). We examined whether psychological distress and working conditions are jointly associated with SA periods of 1-7 days and 8+ days among young and midlife Finnish employees.

Methods: We linked survey data from the Helsinki Health Study cohort from 2017 (response rate 51.5%) with the employer's SA register for the City of Helsinki, Finland (82% consented to the linkage; n = 3949, 80% women, age 19-39 years). Mean follow-up time was 2.1 years. We calculated rate ratios (RR) and 95% confidence intervals (CI) for SA periods of 1-7 days and 8+ days using negative binomial regression models among participants with and without psychological distress, and with and without exposure to strenuous working conditions. Psychological distress was measured with the emotional wellbeing subscale of RAND-36 (cut-off 60 points). Working conditions included physical and mental strenuousness of work and hours per day spent in heavy physical work.

Results: Participants with psychological distress and exposure to strenuous working conditions had the highest age- and gender-adjusted RRs for SA periods of ≥ 8 days (physically strenuous work: RR: 2.38, CI: 1.97-2.88; mentally strenuous work: RR: 2.08, CI: 1.72-2.53; ≥ 3 h per day spent in physical work: RR: 2.48, CI: 2.01-3.06), the interactions being additive. The associations were weaker for SA periods of 1-7 days. Adjusting for marital and employment status, education, alcohol use, smoking and body mass index only slightly attenuated these associations.

Conclusions: Psychological distress and exposure to strenuous working conditions were additively associated with SA. Both individual- and workplace-related risk factors for SA are important to be considered when planning preventive actions.

Key messages:

- Young and early midlife Finnish employees with simultaneous psychological distress and exposure to strenuous working conditions had the highest rates of SA periods, the interactions being additive.
- Both psychological distress and exposure to strenuous physical and mental working conditions should be considered when planning preventive actions to reduce employees' SA.

Abstract citation ID: ckae144.728
Antidepressant medication before and after exiting paid work: a population-based study from Sweden

Tea Lallukka

T Lallukka[1,2]*, K Alexandersson*[2]*, K Farrants*[2]
[1]University of Helsinki, Helsinki, Finland
[2]Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden
Contact: tea.lallukka@helsinki.fi

Background: Exiting paid work can be linked to changes in mental health. However, antidepressant medication as an indicator of mental disorder has not been studied in a population that continues working longer. We aimed to explore trajectories of antidepressant medication before and after exiting paid work, among people in paid work at least until age 66. We then examined how sociodemographic factors and prior sickness absence and disability pension (SADP) were associated with such trajectories.

Methods: We included all people living in Sweden 2005-2020, aged 65-70 and in paid work 2010 based on income (N = 32,849, 39% women). All participants were in paid work at least 2005-2011, exited work during 2012-2015 and were not in paid work 2016-2020. We used register microdata for five years before and five years after exiting paid work and included a range of sociodemographic factors at the exit year as well as number of SADP days/year due to mental diagnosis (ICD-10) prior to work exit. We used group-based trajectory modelling to examine developmental patterns in antidepressant medication (ATC-code N06A) and average marginal effects to study factors that were associated with each trajectory.

Results: A majority, 89.5% did not have any antidepressant medication during the study period. Among those with such medication, two latent trajectories were identified: 94% had constant use and 6% increasing use. Having any SADP due to mental diagnoses before work exit was the most consistent determinant of belonging to the trajectories of increasing or of constant use of antidepressant medication, even after full adjustments. Older age at work exit was associated with a lower likelihood of belonging to increasing antidepressant medication trajectory.

Conclusions: Exit from paid work did not result in any major changes in the developmental patterns in antidepressant medication. Prior SADP was the most consistent determinant of antidepressant medication even after exit from paid work.

Key messages:

- Most people working until aged 66 or older had no antidepressant use and among those who did, the use was stable. Only in a small group such medication increased, already before their work exit.
- Sickness absence or disability pension days with mental diagnoses before work exit was associated with both increasing and constant antidepressant medication trajectories after the work exit.

[6]Department of Women's Health, Karolinska University Hospital, Stockholm, Sweden
Contact: zakir.hossin@ki.se

Background: Despite growing evidence linking maternal diabetes to impaired brain physiology and neurodevelopment in offspring, evidence on its effect on epilepsy remains scarce. This study aims to determine if intrauterine exposure to maternal pre-existing and gestational diabetes mellitus is associated with risk of offspring epilepsy.

Methods: We studied >2.3 million singletons live-born in Sweden between 1998 and 2021, with final follow up until October 31, 2023. The Swedish Medical Birth Register was linked to the National Patient Register to identify gestational diabetes (GDM), maternal pre-gestational type 1 (T1DM) and type 2 diabetes (T2DM), and offspring epilepsy. The incidence of epilepsy, comparing offspring of mothers with versus without diabetes, was calculated as hazard ratios (HR), adjusting for maternal education, smoking, body mass index, hypertension, epilepsy and other important confounders.

Paternal T1DM and T2DM were additionally analysed as negative control exposures to assess genetic confounding.

Results: Of the 2,335,245 offspring analysed (48.9% female), 13,883 (0.6%) were exposed to maternal T1DM, 4477 (0.2%) to T2DM, and 37,253 (1.6%) to GDM. During a median follow up of 13 years (range 0-26 years), 18,732 offspring were diagnosed with epilepsy. Maternal T1DM (HR 1.27, 95% confidence intervals [CI] 1.08-1.49) and T2DM (HR 1.34, 95% CI 1.00-1.49) were associated with higher hazards of epilepsy in offspring, compared with no exposure to maternal diabetes. Preterm birth and birth-asphyxia jointly mediated 63% and 39% of these associations, respectively. No association was found between maternal GDM and epilepsy. Paternal T1DM and T2DM did not show association with epilepsy.

Conclusions: In this nationwide population-based cohort study, children of mothers with T1DM or T2DM showed an elevated risk of epilepsy. The results from paternal comparison and mediation analyses suggest a key role of the intrauterine environment in the aetiology of epilepsy.

Key messages:

- Maternal pre-existing T1DM and T2DM might be risk factors for epilepsy in offspring and are likely to influence the risk through the intrauterine environment independent of genetic mechanisms.
- In the context of a globally rising prevalence of diabetes in women who get pregnant, it is crucial that the diabetes is well-regulated and birth complications associated with diabetes are prevented.

Abstract citation ID: ckae144.730
Self-rated health in preadolescents as a predictor for prescription redemption and hospital contacts

Camilla Klinge Renneberg

CK Renneberg[1,2], *CU Rask*[2,3], *D Rytter*[1], *SN Hansen*[1], *BH Bech*[1]
[1]Department of Public Health, Aarhus University, Aarhus, Denmark
[2]Department of Child and Adolescent Psychiatry, Aarhus University Hospital, Aarhus, Denmark
[3]Department of Clinical Medicine, Aarhus University, Aarhus, Denmark
Contact: ckr@ph.au.dk

Background: The decline in self-rated health among children and adolescents raises concerns for their overall well-being and future health outcomes. We examined whether self-rated health in preadolescence predicts both psychiatric and somatic prescription redemption and hospital contacts in later adolescence.

Methods: This cohort study is part of the Danish National Birth Cohort and focuses on children born between 1996 and 2003. A survey was distributed to 96,382 preadolescents aged 11, who were then followed from 2010 to 2018 (average follow-up of 6.9 years). Data on prescriptions and hospital contacts were obtained from Danish registries. Negative binomial regression was employed to calculate the incidence rate ratio (IRR), comparing preadolescent children who rated their health as poor ('Not So Good'/'Poor') to those who rated it as good ('Excellent'/'Good').

Results: Of the 47,365 (49.1%) 11-year-old preadolescents who participated in this study, 5.3% reported experiencing poor self-rated health. Overall, adjusted analyses revealed higher rates of prescription redemptions (IRR 1.63 [95% CI: 1.53; 1.73]) and hospital contacts (IRR 1.86 [95% CI: 1.74; 1.99]) in these children. Poor self-rated health in preadolescence was associated with more somatic (IRR 1.51 [95% CI: 1.40; 1.62]) and psychiatric (IRR 3.04 [95% CI: 2.59; 3.57]) prescriptions, as well as somatic (IRR 1.61 [95% CI: 1.51; 1.72]) and psychiatric (IRR 2.80 [95% CI: 2.42; 3.25]) hospital contacts in adolescence, with similar associations across sexes.

Conclusions: Poor self-rated health in preadolescence is associated with higher rates of prescription redemption and hospital visits in adolescence, suggesting that perceptions of health in early life influence long-term well-being, especially regarding psychiatric health. This straightforward self-rated health measure offers healthcare professionals valuable insights for identifying children who may require support and early intervention.

Key messages:

- Poor self-rated health in preadolescence predicts higher prescription redemption and hospital visits in adolescence, especially regarding psychiatric health.
- Simple self-assessment of health in childhood may have the potential to help identify those needing support and early intervention for long-term well-being.

Housing tenure and acute lower respiratory tract infection admissions in two Scottish birth cohorts

Caroline Hart

C Hart[1], *P Hardelid*[1], *B De Stavola*[1], *S Hajna*[2], *S Cunningham*[3], *J Taylor*[4], *J Cruz*[1]

[4]Department of Civil Engineering, University of Tampere, Tampere, Finland
Contact: caroline.hart.18@ucl.ac.uk

Introduction: Early-life acute lower respiratory tract infections (LRTI) have been associated with increased morbidity and mortality. Despite young children spending much of their time at home, the contribution of home ownership status, on LRTI hospital admissions is unknown.

Objectives: To estimate the association between housing tenure and the odds of LRTI hospitalization in children <2 years in two birth cohorts.

Methods: De-identified Scottish birth records were linked to maternal Census data (2001 and 2011) and to hospital admission data to construct two birth cohorts (Cohort 1 (C1), born 2000-2002; Cohort 2 (C2), 2010-2012). Using logistic regression we estimated the association of housing tenure (owned, social rented, private rented, rent-free) with the odds of LRTI hospital admission, before and after adjustment for maternal age, residential area, and maternal qualification level.

Results: Over the 2-year follow-up, there were 14,833 LRTI admissions in 12,527 children (10,832 children had 1 LRTI admission and 1,695 >1 LRTI admission). 75.6 % of all LRTI admissions were due to bronchiolitis. In C1 and C2, 4.0% and 5.3% children, respectively, had one or more LRTI admission. Compared to children living in owned housing, the odds of LRTI admission were higher in children living in social rented housing (C1: Odds ratio=1.40, 95% confidence interval: 1.31-1.49; C2: 1.23, 1.16-1.31), private rented (C1:1.24, 1.11,1.39; C2: 1.14, 1.06-1.21), and rent-free housing (C1: 1.53, 1.35,1.74; C2: 1.04, 0.80-1.36) after confounder adjustment.

Conclusions: We found an association between non-owned housing and higher odds of LRTI admission which was more marked in C1 than in C2. Further research is warranted to unpick the mechanisms underlying the association between housing tenure and LRTI admission. Interventions to prevent LRTI admissions could usefully target children living in non-owned housing.

Key messages:

- This study demonstrates the value of administrative and health data linkage in improving our understanding of how socio-environmental factors might impact children's respiratory health.
- Children living in social and private rented housing (compared to owned housing) have a higher risk of LRTI hospital admission and could benefit the most from LRTI-lowering interventions.

11.O. Scientific session: Mental Health Among Sexual and Gender Minority Populations in Diverse Structural Stigma Environments

Abstract citation ID: ckae144.732

Organised by: EUPHA-SGMH
Chair persons: Richard Bränström (EUPHA-SGMH), Arjan van der Star (EUPHA-SGMH)
Contact: richard.branstrom@ki.se

Research conducted across numerous countries finds that sexual minority (e.g., lesbian, gay, and bisexual [LGB]) and gender minority (e.g., transgender [T]) individuals represent high-risk populations for poor mental health and suicidality. These disparities are believed to be a consequence of a stigmatizing environment and sexual and gender minority individuals' disproportionate exposure to stigma-based stress compared to cisgender (i.e., non-transgender) heterosexuals. Stigma occurs at multiple levels to compromise LGBT individuals' health. At the structural level, stigma manifests as unjust laws, policies, and cultural norms that deny, or fail to protect, the equal rights of LGBT individuals. At the interpersonal level, stigma manifests as discrimination in social interactions, social exclusion, and outright victimization. At the individual level, stigma can tax LGBT individuals' coping resources by requiring costly behavioral strategies such as concealment of one's LGBT identity. In this workshop, four studies from different regional environment with varying degree of structural stigma will be presented, i.e., the USA, Switzerland, Rwanda, and Kenya. They resent novel findings on the processes and mechanism underlying LGBT populations increased risk of mental health and links between stigma experiences at different levels. Dr. Clark will present a study of how negative news media coverage influence suicidality among LGBT young adults in the USA using intensive longitudinal assessments. Dr. Pfister will present findings from in-depth interviews concerning suicidality with individuals representing a wide variety of sexual and gender minority identities in Switzerland. Dr. van der Star will present a study exploring how structural stigma environments are linked to interpersonal and individuals level stigma experiences in sexual minorities representing different generations of LGBT populations. Dr. Stojanovski will present data from surveys and interviews of LGBT populations in Kenya and Rwanda focusing on experiences of discrimination and mental health.

Key messages:

- Negative media reporting, discrimination, and barriers to health care can influence mental health and suicidality among LGBT individuals.
- Identity concealment may represent a mechanism through which sexual minorities navigate structurally stigmatizing climates.

Abstract citation ID: ckae144.733
Real-time exposure to negative news media and suicidal ideation intensity among LGBTQ young adults in a high-stigma US state

Kirsty Clark

Background: With a recent surge in anti-LGBTQ policies and associated news/media coverage worldwide, there is a crucial need to study the role of LGBTQ negative news/media on proximal risk for suicide among LGBTQ youth, especially in high-stigma contexts.

Methods: Using a smartphone-based protocol, participants responded to brief self-report surveys 3x per day for 28 consecutive days. LGBTQ young adults (ages 18-24 years old) residing in Tennessee with recent suicidal ideation were recruited. At each assessment, participants reported real-time exposure to negative news/media, whether the news/media was related to LGBTQ topics, expectations of anti-LGBTQ rejection, and current intensity of passive suicidal ideation, active suicidal ideation, and self-harm ideation. Statistical analyses employed multilevel path analyses with restricted maximum likelihood estimation.

Results: 31 participants completed 2189 assessments (90.5% median compliance). Within-person effects showed that real-time exposure to LGBTQ - but not general - negative news/media was positively associated with suicidal ideation intensity. Significant indirect effects were present from exposure to LGBTQ negative news/media to higher suicidal ideation intensity through expectations of rejection. Mediation through expectations of rejection accounted for 25% and 39% of the total effect for active and passive suicidal ideation, respectively.

Conclusions: Findings have important public health implications related to media reporting, policy, and clinical intervention. Interventions targeting media organizations should promote responsible reporting practices and increase awareness of the potential suicidogenic impact of negative LGBTQ news coverage. This study joins numerous others in documenting the potential mental health harms of policies that restrict LGBTQ visibility and rights. Mental health professionals play a vital role in promoting coping in the face of exposure to LGBTQ negative news/media content.

Contact: pand@zhaw.ch

Background: Despite the numerous research on the determinants and risk factors of suicide attempts, an understanding of suicide attempts as a process that holistically captures the perspectives of the actors involved is still lacking. Our study, therefore, aimed to better understand, from different perspectives, how (process) and why (subjective meaning, patterns of interpretation) (a) suicide attempt(s) among

LGBTQ+ youth happen and to relate LGBTQ+-specific vs. non-specific factors.

Methods: From 2021 to 2024, we interviewed LGBTQ+ youth in Switzerland who had attempted suicide between the ages of 14 and 25. As part of a multi-perspective approach, we also interviewed people from their social environment where possible. Data were collected and analysed using Grounded Theory Methodology, including theoretical sampling. The final sample consisted of 41 people: 7 bisexual/lesbian cis women, 4 bisexual/gay cis men, 15 trans/non-binary people of different sexual orientations, 3 heterosexual cis people, and 12 people from their social environment.

Results: Sexual orientation and gender identity (SOGI) emerged as either background or foreground "music" of the suicidal processes. In some LGBTQ+ youth, SOGI were key factors influencing their suicidality, e.g. experiencing a major lack of acceptance and barriers to accessing gender-affirming transition (foreground music type). In others, suicidality was mainly related to other aspects than SOGI, especially fundamental ones such as unsafe familial circumstances or sexualised violence, which were accentuated by SOGI-related factors e.g. feeling a lack of belonging (background music type). Further, a mixed type was identified, with SOGI and non-SOGI-related factors being equally important for suicide attempt(s).

Conclusions: Our study implies the need to adapt health promotion, suicide prevention, and early detection and intervention strategies according to the identified types of suicidal processes.

[2]San Diego State University, UC San Diego Joint Doctoral Program in Clinic, San Diego, CA, USA
[3]Faculty of Social and Behavioural Sciences, University of Amsterdam, Amsterdam, Netherlands
Contact: avanderstar@sdsu.edu

Background: The current study aimed to longitudinally examine whether intrapersonal stigma (i.e., internalized stigma; identity concealment) mediates the associations between interpersonal stigma (i. e., adulthood and childhood victimization; everyday discrimination; perceived external stigma) and mental health outcomes among sexual minority adults, and as a function of two moderators: structural climate and generation.

Methods: Data from 600 sexual minorities across three generations (i.e., ages 18-25, 34-42, 48-55) who completed all three waves of the 2016-2019 Generations Study were merged with census division data on legal climate (2016 Human Rights Campaign State Equality Index). A series of three-wave time-lagged simplex moderated mediation models were estimated for each independent and dependent variable combination through two parallel mediators, with both moderators included on each independent-mediator variable pathway.

Results: Greater identity concealment partially explained the effects of perceived external stigma on greater psychological distress and suicidal ideation, but most strongly among older generations. Other mediation was not supported. Reversed sensitivity analyses revealed how identity concealment's positive effect on suicidal ideation may be suppressed through lower adulthood victimization and, only among younger generations in higher stigma climates, how it's positive effects on psychological distress and suicidal ideation may be suppressed through lower everyday discrimination.

Conclusions: Identity concealment may represent a salient mechanism through which sexual minorities navigate structural climates and the harmful effects of interpersonal stigma on distress and suicidal ideation. While the longitudinal findings provide some support for the cross-level effects of sexual minority stigma on mental health outcomes, further advanced time-lagged examinations are warranted.

Contact: kstojanovski@tulane.edu

Background: Globally lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons experience stigma across at multiple socioecological levels with health-harming impacts. The objectives of this study were to quantify and explore how stigma shapes mental health among LGBTQ+ persons living in Rwanda and Kenya.

Methods: Respondent-driven sampling was used in this mixed methods study of LGBTQ+ persons. In Rwanda, we surveyed 499 and conducted focus groups with 59 persons. In Kenya, we surveyed 1,573 persons, conducted focus groups with 40 persons, and conducted 113 individual interviews. We used thematic analysis for the qualitative data to examine how LGBTQ+ discuss what shapes their mental health.

Results: The average depression score was 6.3, which is categorized as mild depression. Additionally, 36% (n = 744) scored as mild, 14% (n = 289) as moderate, 5% (n = 110) as moderately severe, and 2.5% as severe (n = 52). Average scores were the same in Kenya and Rwanda. In regression models, as compared to cisgender males, cisgender females' depression scores were 2.1 points higher (95% CI 1.5, 2.8), trans male scores were 1.6 points higher (95% CI 0.7, 2.5), trans female scores were 1.9 points higher (95% CI 1.1, 2.7), and gender non-conforming scores were 1.7 points higher (95% CI 1.0, 2.4). As compared to transgender people, lesbian & gay participants had depression scores that were 0.93 points lower and bisexual 1.3 points lower ($p < 0.000$). In adjusted regression models, we found that for every one-unit increase in discrimination, depression scores increased by 0.44 (95% 0.36, 0.52). Qualitatively, stigma was described as a prominent factor in negatively impacting mental health.

Conclusions: LGBTQ+ people in Rwanda and Kenya experience elevated mental health issues that arise from discrimination due to their stigmatized identity.

11.P. Scientific session: Behavioural Science of Emergency Preparedness across Europe

Abstract citation ID: ckae144.737

Organised by: RIVM (Netherlands), EC, WHO/Europe, Carlos III Health Institute (Spain), NIJZ (Slovenia)
Chair persons: Tina Likki (Denmark)
Contact: mart.van.dijk@rivm.nl

The COVID-19 pandemic highlighted the critical role of human behaviour in times of crisis. However, it also revealed that the behavioural sciences were not optimally prepared to provide actionable insights to policy makers to support preventive and coping behaviours in a crisis context. To ensure that the behavioural sciences can provide timely and effective advice to policy makers during future emergencies, it is key to act before a crisis occurs. The current workshop chaired by the Behavioural and Cultural Insights Unit of the WHO, will offer five perspectives to explore how behavioural science as a discipline is being applied to our understanding of pandemic and emergency preparedness and what concrete actions can and are already being taken now. Following five short presentations, a discussion with the panel and the audience will take place. The Dutch National Institute of Public Health and the Environment (RIVM) will start by presenting their approach toward embedding behavioural science of pandemic preparedness: the organisation of a national stakeholder network, the development of a conceptual framework, and3) development of a quantitative survey monitor for individual level behaviour. monitoring pandemic preparedness. f The Spanish Carlos III Health Institute and Slovenian Public Health institute will present insights about operationalising this monitor in their given context. They will present results of the first two rounds of this monitor on behalf of the four European member states, focusing on comparative insights on perceptions and states of preparedness, vaccination, citizen wellbeing and resilience with respect to their context. Next, the Competence Centre on Behavioural Insights of the European Commission will present an experimental approach toward preparedness. They will present results based on a scenario study, focused on understanding behaviours in the broader context of pandemic and disaster preparedness. The last two presentations will reflect on qualitative approaches. The Behavioural and Cultural Insights Unit of the WHO will present their qualitative study on health-service access, needs and behaviours of Ukrainian refugees in neighbouring countries, and reflect on operating under emergency constraints. In the final presentation the RIVM will present their findings of qualitative methods to study perceived emergency readiness. In particular, their study focuses on what citizens understand by pandemic preparedness, and to what extent they perceive their government as prepared for a future pandemic. Overall, the workshop aims to equip participants with a comprehensive understanding of the importance of behavioural science in pandemic and disaster preparedness and inspire collaborative action towards building resilient and effective strategies for future crises.

Key messages:

- The workshop underlines the importance of behavioural science in preventing and responding to infectious disease outbreaks.
- Participants learn how behavioural sciences can already be applied now to prepare citizens and organisations for future pandemics and crises.

Abstract citation ID: ckae144.738
A behavioural perspective on pandemic preparedness

Saskia Euser

S Euser[1], M van Dijk[1], R Dekker[1], M de Bruin[1,2], S Mehra[1], J Sanders[1,3], F Kroese[4]

Driven by lessons learned from the COVID-19 pandemic, the RIVM Behavioural Unit is working on the preparedness of social and behavioural sciences. This includes establishing and maintaining a stakeholder network and a knowledge base on pandemic preparedness and behaviour. Using the socio-ecological model and the emergency management cycle, we propose a conceptual framework for a behavioural perspective on pandemic preparedness. The multilevel (individual, community, organisational, national and supra-national), time-dependent (cold, acute, recovery phase) structure of the framework can be helpful in explicating who has to do what, when. In addition, to explain and understand what different actors require for those behaviours prior to or during a pandemic, we propose an adapted version of the COM-B model (Michie et al., 2011), including determinants of behaviour related to motivation, capabilities and opportunities. Based on these frameworks, various monitoring tools are developed. Here we present the Pandemic Preparedness and Behaviour (PPb) survey aimed at cold phase monitoring behaviour on an individual level (i.e. hygiene behaviours, social activity, preparedness behaviours) and their determinants. With this survey we will obtain baseline measurements ahead of a possible future pandemic and will have developed the appropriate tools to be used in a hot phase for as much as possible. In addition, results on cold phase determinants can help to identify where communities, organisations and governments can provide support to improve pandemic preparedness. In this presentation, the proposed conceptual framework and the PPb survey will be discussed, together with their relevance for preparedness of the social and behavioural sciences.

Contact: jforjaz@isciii.es

One of the lessons learned from the COVID-19 pandemic is that monitoring determinants and behaviour can improve policy and communication strategies. To improve countries' capacity to respond in a hot phase of a pandemic and build a resilient society, suitable monitoring in a cold phase of various behaviours and determinants that could become important in future pandemics is key. In

March 2024 we launched the first round of the Pandemic Preparedness and Behaviour (PPb) survey in four European member states: Spain, Slovenia, Ireland and The Netherlands (N = ∼1000 per country). In this presentation we start by showing key findings. For example, we found that overall, approximately one third of participants believe their government is prepared if a new pandemic would occur next month. Next, we discuss similarities. For example, we find that in all four countries, perceived preparedness of self is higher than perceived preparedness of one's government. We also address key differences, such as distinct patterns in perceived risk of a highly contagious outbreak in the next 5 years (whereas in Spain 26% perceives of participants an outbreak as probable, this is 43% in Slovenia) or differences in self-reported adherence to hygiene behaviours (i.e. handwashing after coughing or sneezing in elbow is markedly higher in the Slovenian sample than in the Netherlands). Next, we explore which determinants of these patterns are generalisable, and which are specific to two of the four countries: Spain and Slovenia. We follow up by comparing insights for policy and practice in their given contexts, as well as lessons learned with respect to use and development of the monitor. We conclude that monitoring individual behaviours and its determinants helps to develop joint efforts in developing effective public health policies across Europe regarding pandemic preparedness.

A scenario study on disaster preparedness behaviours

Colin Kuehnhanss

C Kuehnhanss[1], *H Nohlen*[1]
[1]Competence Centre on Behavioural Insights, European Commission, Brussels, Belgium
Contact: Colin.Kuehnhanss@ec.europa.eu

Europe has faced several crises over recent years, including the COVID-19 pandemic and the war in Ukraine. Additionally, the climate crisis has led to an increase in the occurrence of extreme weather events and natural disasters. Getting citizens on board when it comes to being prepared for the changing risk landscape in the EU is essential in building societal resilience. The importance of the population's preparedness to deal with disasters has also been underlined by the Commission's identification of the Union Disaster Resilience Goals (2023/C 56/01). One of these goals focuses on increasing risk awareness and the adoption of risk prevention and preparedness measures among the population. Research has shown that simply advising people of potential risks in their region is not necessarily sufficient to motivate them to prepare. Yet, preparation is key to an adequate responses in emergency situations and improving preparedness may thus be a powerful tool to support the population's ability to respond in times of crisis. The EC JRC's Competence Centre on Behavioural Insights will present a study conducted in five member states (N = ∼1000 per country), which investigates the effect of envisioning a disaster situation, and therefore explicitly eliciting personal affectedness, on individuals' self-reported preparedness intentions and preparedness behaviours. The study uses multiple measures for intentions and preparedness behaviours, including click-through to external information and an incentivised preparedness game.

The Russian invasion of Ukraine led to the movement of millions of people. As neighbouring countries opened their borders and made services available to those fleeing war, it became imperative to understand the refugee perspective. To gain insights into refugees' health-service access, needs and behaviours, the WHO Regional Office for Europe Behavioural and Cultural Insights (BCI) Unit conducted qualitative interviews with Ukrainian refugees residing in Czechia, Poland, Romania, Slovakia and Slovenia. Ukrainian researchers interviewed refugees online, recruiting participants through social media channels and outreach activities. The findings were discussed in high-level meetings, stakeholder workshops and webinars, and informed action by partners, governments and WHO. As examples, refugee clinics were initiated in Czechia, Poland and Romania. Cultural mediators were engaged in Romania to support health-care access at local level, and nongovernmental organizations were supported in providing tailored assistance. In Poland, the telephone hotline for Ukrainian health workers was expanded to include a line for general information, and Slovakia extended health coverage for all refugees under the age of 18.

Citizen's perspective on pandemic preparedness

Sumit Mehra

S Mehra[1], *A Gorter*[1], *T de Valk*[1], *S Euser*[1]
[1]Behavioural Unit, RIVM, Bilthoven, Netherlands
Contact: sumit.mehra@rivm.nl

In the aftermath of COVID-19, pandemic preparedness has become a key concern for governments and public health institutes across the world. As policymakers and scientist grapple with the lessons learned and implications for pandemic preparedness, it is also imperative to take the perspectives of citizens into account. To explore the perceptions and expectations regarding pandemic preparedness, the Behavioural Unit of RIVM conducted a qualitative follow-up study amongst a representative sample of Dutch citizens. At different locations in the Netherlands focus groups were organized with diverse participants. The topic guide was based on an analysis of a previously administered pandemic preparedness questionnaire and theoretical framework, also presented in the current workshop. Topics included risk perceptions, trust in government and other institutions versus self-reliance and the role of media and communication. Furthermore, pandemic preparedness was contrasted with other forms of disaster and crisis management. During the presentation the latest results are shared, and we will discuss possible policy recommendations and how the general public can be involved to develop a better understanding of their needs with respect to preparedness.

11.Q. Round table: A Guide for creating a code of ethics for public health professionals and institutions

Abstract citation ID: ckae144.743

Organised by: EUPHA-ETH, Global Network for Academic Public Health, Faculty of Public Health (UK), ASPHER
Chair persons: Els Maeckelberghe (EUPHA-ETH), Mary Codd (Ireland)
Contact: farhang.tahzib@gmail.com

The professional discipline of public health is driven by its values. Public health professionals face decisions that have far-reaching ethical implications. Our norms, values, beliefs and the way we see the world, as individuals, communities and institutions which serve us, do matter and fundamentally affect our decisions, behaviours, policies, and practice. The ability to be aware and reflect on norms and values when taking decisions, is a decisive professional virtue in public health practice. The World Health Organisation (WHO) and Association of Schools of Public Health in the European Region (ASPHER) Roadmap for the professionalisation of the public health workforce, has highlighted ethics as an essential pillar for professionalisation, a core competency, and the need for a Code of Ethics and Professional Conduct for good public health practice. In order to further advance the issue the Global Network for Academic Public Health (GNAPH), ASPHER, the European Public Health Association (EUPHA), the UK Faculty of Public Health and other partners set up an expert international joint working group on public health ethics and law (PHELWG). The PHEL expert working group - which includes senior public health professionals, ethicists, lawyers and academics - has been working to carry out research and develop a guide for creating a Code of Ethics and Professional Conduct for public health professionals and institutions. This has included consideration of the competencies, principles and values for good public health practice. The project has involved literature review, research and the wide professional experience of the international group of experts who have been working on the issue.The development of a guide for creating a code of ethics for public health professionals and institutions is part of the overall objective of the PHELWG to build a ethico-legal competency, capacity and resilience of public health workforce. The proposed Guide and related resources will be a timely resource, practical tool and support for public health professionals, organisations, or regulatory bodies to develop their own local country code of ethics and build further ethico-legal capacity of their public health professional workforce and institutions.
Purpose of the roundtable workshop will be to:
- present the guide on creating a code of ethics for public health public health professionals and institutions, which will be launched at that time
- Share the proposed ethical competencies/skills, principles and values for good public health practice, with particular consideration of Indigenous knowledge and world views
- reflect and consult with the workshop participants around the guide and the proposed pilot sites for implementing the Codes in various centres.

Key messages:
- Development of Code of ethics and professional conduct is a key requirement for public health professionalization.
- The Guide for creating code of ethics by international expert group provides significant resource for development of codes locally.

4. Pecha Kucha Sessions

1.X.1. Achieving universal health coverage: international lessons from Irish policy implementation

Abstract citation ID: ckae144.744

Organised by: Trinity College Dublin (Ireland)
Chair persons: Martin McKee (UK), Zeynep Or (France)
Contact: carlos.bruen@gmail.com

Health systems all over the world are struggling to meet population health needs and provide timely access to universal healthcare in the context of the COVID-19 pandemic. COVID-19 occurred in Ireland in the early years of implementation of a national plan for universal healthcare, called Sláintecare. While many health systems are experiencing a retrenchment on universalism in the context of COVID-19, in Ireland despite tediously slow Sláintecare implementation, the pandemic provided a boost to reform implementation and universalism. The reason for this workshop is to draw on a publicly funded Health Research Board Applied Partnership Award, entitled 'Foundations', harnessing lessons from the Irish COVID-19 health system response to inform Sláintecare's implementation https://hrbopenresearch.org/articles/3-70/v1
The objectives of the workshop are to
1) provide academic research evidence from the Irish experience of universal health system reform during and since COVID-19;
2) to give participants space to reflect on the implications of the Irish universal health system reform on international health systems and policy;
3) to actively involve workshop participants in an engaged discussion on implementing universal health coverage in the context of COVID-19.
The added value of the workshop is to share learnings from an academic research programme, which is coproducing evidence in partnership with the Irish health system, in a worldwide context, providing relevant and thought-provoking discussion and analysis

for an international audience. Four separate inter-related presentations will draw on aspects of the Foundations' research project. Presentation 1, Prof Sara Burke will outline recent academic literature on universalism and the politics of reform implementation in the context of COVID-19 and present a timeline of universal healthcare reform implementation since 2018 when Sláintecare was adopted by the Irish government (14 mins). Presentation 2, Dr Sarah Parker will detail a specific study which set out to advance understanding of how and to what extent COVID-19 has highlighted opportunities for change that enabled better access to universal, integrated care in Ireland, with a view to informing universal health system reform and implementation (10 mins). Presentation 3, Dr Katharine Schulmann and Carlos Bruen will present findings on the governance of reform implementation and implications for all health systems (10 mins). Presentation 4, Dr Philip Crowley, Health Service Executive (HSE) National Director of Strategy and Research and Chair of the Foundations' research steering group will reflect how research findings can inform implementing reform and their implications for all health systems (6 mins). There will be four presentations totalling 40 mins, followed by questions and discussion chaired by an international expert/academic on universal health systems.

Key messages:

- COVID-10 has highlighted how universal health coverage is more important than ever, however the pandemic has resulted in some retrenchment on universalism.
- While data and research drove health system decision making during the pandemic, embedding research evidence into health system and policy reform remains challenging and can be politically opposed.

The politics of universal health system reform in the context of COVID-19

Carlos Bruen

S Burke[1], *S Parker*[1], *K Schulmann*[1], *C Bruen*[1], *L Mac Conghail*[1,2]
[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
[2]HSE, Dublin, Ireland
Contact: carlos.bruen@gmail.com

Background: Implementing universalism is more a political than a technical project. With this in mind, Ireland devised a ten-year plan through political consensus to deliver universal healthcare - Sláintecare. The COVID-19 pandemic occurred early in its implementation.

Methods: This is qualitative research drawing on international literature on universal health system reform in the context of COVID-19 as well as the politics of health reform. The overall research programme is co-produced with the Irish health system. A timeline and analysis of the reform journey is drawn from documentary analysis of key policy documents, parliamentary reports and key informant interviews.

Results: Despite a policy commitment since 2005, universal healthcare implementation only became government policy in Ireland 2018. While whole system reform and implementation progress has been slow, the COVID-19 health system response boosted aspects of universalism and reform. All COVID-related services during the pandemic were universal, free at the point of delivery, as are most new services introduced since 2021. Despite the political consensus holding through a change government and the pandemic, and significant additional investment in the public health system, there remain many obstacles to reform. These include different stakeholder understanding of implementing universalism in Ireland especially in the context of COVID-19, how best to implement universal healthcare and the politics of delivering reform.

Conclusions: Contrary to other countries' experience during COVID, Ireland pursued its policy aim of delivering universalism and expanded services provided universally, free at the point of delivery, with a focus on enhanced community care. The universalism applied to COVID-related prevention and care, new women's health and chronic disease management services. Despite progress, government has yet to legislate for a universal entitlement to care and obstacles to reform implementation remain.

How to not revert to type: learnings from the pandemic response for universal health system reform

Sarah Parker

S Parker[1], *S Burke*[1], *L Mac Conghail*[1], *R Siersbaek*[1]
[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
Contact: saparker@tcd.ie

Background: Understanding of the opportunities and learnings for health system change that have arisen during the pandemic is still emerging. Situated in the Irish health reform context of Sláintecare, the programme which aims to deliver universal, integrated healthcare, this study set out to generate evidence on the processes that impacted access to universal, integrated care during COVID-19, with a view to informing universal health system reform and implementation.

Methods: The study, which is qualitative, was underpinned by a co-production approach with Irish health system leadership. Semi-structured interviews were conducted with 16 health system professionals (including managers and frontline workers) from a range of responses to explore their experiences during the pandemic. Following thematic analysis, a complexity-informed approach guided the interpretation of the findings.

Results: A range of factors facilitated better access to integrated care during the crisis, falling under three key themes (1) nurturing whole-system thinking through a clear, common goal and shared information base; (2) harnessing, sharing and supporting innovation; and (3) prioritizing trust and relationship-building in a human-centred health system.

Conclusions: Alongside establishing health system structures, we must also incorporate alternative approaches to reform that recognise the value of shared sense-making in an interdependent system, while also allowing for innovation, exploration and learning; and acknowledging the role of social dynamics in driving change.

Abstract citation ID: ckae144.747
The role of governance in shaping health system reform: a case study of the design and implementation of new health regions in Ireland, 2018–2023

Katharine Schulmann

K Schulmann[1], *C Bruen*[1], *S Parker*[1], *R Siersbaek*[1], *S Burke*[1]
[1]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
Contact: kschulma@tcd.ie

Background: This study focuses on the development of new regional health structures in Ireland in the period 2018-2023, one part of a broader health system reform programme aimed at greater universalism, in order to scrutinise how aspects of governance impact on the reform process, from policy design through to implementation.

Methods: This qualitative, multi-method study draws on document analysis of official documents relevant to the reform process, as well as twelve semi-structured interviews with key informants from across the health sector. Interviews were analysed according to thematic analysis methodology. Conceiving governance as comprising five domains (Transparency, Accountability, Participation, Integrity, Capacity) the research uses the TAPIC framework for health governance as a conceptual starting point and as initial, deductive analytic categories for data analysis.

Results: The analysis reveals important lessons for policymakers across the five TAPIC domains of governance. These include deficiencies in accountability arrangements, poor transparency within the system and vis-à-vis external stakeholders and the public, and periods during which a lack of clarity in terms of roles and responsibilities for various process and key decisions related to the reform were identified. Inadequate resourcing of implementation capacity, competing policy visions and changing decision-making arrangements, among others, were found to have originated in and continuously reproduced a lack of trust between key institutional actors.

Conclusions: Large scale health system reform is a complex process and its governance presents distinct challenges and opportunities for stakeholders. To understand and be able to address these, and to move beyond formulaic prescriptions, critical analysis of the historical context surrounding the policy reform and the institutional relationships at its core are needed

Abstract citation ID: ckae144.748

Co-producing research on universal health system reform in the context of COVID-19

Philip Crowley

P Crowley[1], *S Burke*[2], *S Parker*[2], *K Schulmann*[2], *C Bruen*[2]
[1]HSE, Dublin, Ireland
[2]Centre for Health Policy and Management, Trinity College Dublin, Dublin, Ireland
Contact: philip.crowley@hse.ie

Issue: How to co-produce and embed research into universal health system reform implementation in the context of COVID-19. In many respects the pandemic revolutionised the use of data and research, with near real-time data informing key health policy and system decisions. This was evident in the production of publicly available data sets tracking COVID-19 infection as well as health system dashboard tracking activity in real-time and influencing day-to-day decisions made. How can this use of data and research evidence become the norm for all health system reform and policy decisions?

Results: The Foundations' research project is a partnership project in place since Autumn 2019. Initially focused on producing evidence to inform the design and implementation of new regional areas with the Department of Health Sláintecare Reform Office and the Irish national Health Service Executive as partners. When COVID-19 occurred all work on the regions was paused the research pivoted to harness the learnings form the COVID-19 response to inform universal health system reform. The partnership applied research nature of the programme allowed research to be coproduced and co-designed with health system leaders, meant the researchers understood if and when it was possible to engage with partners and how to feed result into the health system at the earliest opportunity.

Lessons: Trust and pre-existing working relationships with partners allowed the research to pivot and to continue during the pandemic. The applied partnership nature of the research meant that at times the health system was very engaged in the research and at other times (eg during COVID waves and surges or the cyber-attack) there was limited engagement. The co-production nature of the research allowed a dynamic, ongoing, two-way learning between the health system and the research team. It is extremely difficult to measure impact of research on health system and reform decisions.

1.X.2. Reducing inequalities in access to care in Europe: achieving universal health coverage and more

Abstract citation ID: ckae144.749

Organised by: European Observatory on Health Systems and Policies
Chair persons: Ewout Van Ginneken (Germany)
Contact: erica.richardson@lshtm.ac.uk

Accessibility is multi-dimensional. Universal Health Coverage emphasises the role of population coverage, the scope of services covered, and the depth of financial protection. However, there are other major barriers for patients that can inhibit universal access to health services: geographical inequalities, organisational barriers, and care denial. Health systems can provide extensive cover in some dimensions such as financial coverage or the range of services covered, but gaps in other dimensions can still act as a major barrier to care. Some groups are excluded from population coverage, other patients must navigate waiting times, medical deserts or cultural barriers in order to access care. In this session we will use an innovative filter framework outline common obstacles that patients in the European Union must overcome before they can access the care they need. We will then highlight policy responses to meet the dual goals of reducing inequalities in access to care and ensuring Universal Health Coverage. This workshop will provide a platform for sharing knowledge on reducing inequalities in access to care in EU countries. The objectives of the workshop are to i) highlight cross-cutting themes and approaches, and ii) establish opportunities for cross-country research and learning. The workshop will consist of four short presentations, followed by a broad discussion with audience interventions to bring in the experience of other Member States. Each panel member will make a short presentation in Pecha Kucha format: firstly outlining the filter framework for understanding access to health services then moving to descriptions of a policy journey to strengthening UHC in Cyprus, Estonia and Spain respectively. Bold reforms in Cyprus have expanded coverage under a new universal system; changes in Estonia have improved access to medicines; and policy-makers in Spain have sought to expand coverage of dental care. The moderated discussion will emphasise the potential for cross-country learning - identifying those policy choices of relevance for the rest of Europe. Presentations about specific policy initiatives draw on the latest Health Systems Reviews for Cyprus, Estonia and Spain. Health System Reviews underpin the Health Systems in Transition (HiT) series, a core part of country monitoring undertaken by the European Observatory on Health Systems and Policies. These Reviews are routinely updated and provide a systematic description of the functioning of health systems in countries as well as reform and policy initiatives in progress or under development. As these are in-depth descriptions which detail the intricacies of health systems and an assessment of their performance, they provide the ideal basis for understanding the true multidimensionality of accessibility.

Key messages:

- Even health systems in high-income countries need to address inequalities in access to care to ensure universal health coverage.
- The workshop will identify themes and approaches to improving access to care from a cross-country perspective through a multi-dimensional understanding of accessibility.

1.Y.1. Navigating choppy water for global health competencies, education and innovation in Europe

Abstract citation ID: ckae144.750

Organised by: School of Public Health Bielefeld University (Germany), Circle U. European University Alliance
Chair persons: Lara Tavoschi (Italy), Victoria Saint (Germany)
Contact: victoria.saint@uni-bielefeld.de

Global health is rapidly evolving against a backdrop of increasingly complicated, intersecting challenges and crises across health, socio-economic and ecological systems. Interconnected social justice movements call for greater acknowledgement, accountability and qualified responses to address inequities and their structural drivers. The field of global health is going through a period of reckoning and debate about how colonial legacies and structural inequities pervade the sector and how activities of global health professionals across research, policy and practice are complicit in and perpetuating them. Simultaneously, global health education (GHE) is growing, with new speciality degrees and core or elective courses integrated into degrees in medicine, health and other disciplines. Thus, GHE holds great potential as a space to train future professionals with competencies and aptitudes to confront inequalities through innovative, evidence-informed and sensitive approaches. Yet it is also a space in which inequalities may be reproduced through material and epistemic injustices. To address these paradoxical tensions, transformation in GHE is needed in terms of what is taught, how it is taught and who is involved in teaching. This Pecha Kucha workshop will contribute to this discourse by exploring perspectives on issues including: i) What key competencies and content should be included in GHE across different disciplines and Bachelor, Master or Doctoral level?; ii) How can we better practice and develop in educators and students critical perspectives and capacities to be equipped for and responsive to inequities and social injustice?; and iii) How can we ensure meaningful engagement and partnership in education with countries across varied contexts and communities with direct lived experience of marginalisation and deprivation? Four panellists with diverse backgrounds and perspectives will provide insights on their initiatives to tackles such issues within their own institutions and European alliances, followed by a short discussion with the audience. The presentations will emphasise the need to progressively build affective, practical and cognitive competencies to critically engage with historical, geopolitical and structural inequities and injustices, including how they manifest in local contexts. Panellists will highlight examples of innovative methods and approaches to build these capacities, including through co-design in education that fosters self-reflexivity in students and builds alliances and partnerships with non-academic stakeholders, such as civil society and people with lived experience. The Pecha Kucha workshop aims to inspire exchange across institutions and countries, and with the audience, about how we can collaboratively set our compasses and our sails to navigate the choppy waters of tackling pervasive colonial legacies and sailing towards an equitable, inclusive and effective future for education and action in global health.

Key messages:

- Transformation is urgently needed to ensure that global health education builds curricula and competencies that are sensitive and responsive to historical injustice and structural inequities.
- Equitable partnerships across institutions and with diverse stakeholders, and innovative educational approaches such as gamification and co-design, can address tensions in global health education.

1.Y.2. Children's mental health problems explode. Can exposome research offer a solution?

Abstract citation ID: ckae144.751

Organised by: EUPHA-ENV, -CAPH, -PMH, INCHES
Chair persons: Marija Jevtic (EUPHA-ENV), Peter Van Den Hazel (EUPHA-ENV)
Contact: pvdhazel@upcmail.nl

Background: A week-long, multidisciplinary workshop at the Lorentz Institute explored the expectations of exposome research on child health. Exposome research investigates how combined exposures affect health. Currently we see an increase in adolescent mental health problems in Europe. We explore at the workshop if and how exposome research can be part of the solution to tackle this health issue.

Findings: The workshop aims were to analyze how monitoring data from exposome research can be best used for improving health policy in relation to improving (environmental) health policy in relation to children's health. By taking a deep dive into solution-finding, we explored creative solutions to better utilize existing exposome data from digital data platforms, such as cohort data. And to facilitate working across disciplines using innovative tools of working transdisciplinary across research, policymakers and other professionals. Furthermore, we study how to enhance, harmonize and interpretation of data on child health. Furthermore, we look how child health depends not only on the quality of a healthcare system, but also on the magnitude of negative or positive influencing factors, such as social and environmental factors. Identifying such stressors and reducing their impact through adequate policies can improve child health on local, national, or even global scales. One innovative way of identifying such stressors is the exposome approach. The exposome approach is the characterization of the non-genetic drivers of health and disease. The exposome comprises aspects of the Built environment (characteristics of where we live); the Social environment (with whom we interact, social networks and income); the Physio-Chemical environment (chemical and environmental factors exposure) and the Lifestyle/Food environment (what we eat, how much we exercise) over the entire life-course.

Workshop aims:

- Provide a background on the urgency of adolescent mental health problems in Europe.
- Compare approaches of stakeholders and researchers: stakeholders' input from the practical field can shape the approach of the research process. The second benefit is to derive implications for creating effective interventions and policies to prevent adverse effects of environmental exposures and to foster positive health in children and later in life.
- Explore existing interventions on child health for issues, experiences and possible solutions to the governance and organization of health adaptation in urban and social planning.
- How to act in the process of research to intervention to public policies.

The workshop consists of three short presentations followed by interactive panel discussions. We end with the audience actively engaging in the debate, as well as entering their questions. The workshop will end by identifying the current and future necessary roles, responsibilities, capacities of the public health researchers, policymakers, and professionals for child health protection in complicated exposure settings.

Key messages:

- Child mental health issues are increasing in an unexplainable way.
- Engaging stakeholders into an exposome research process can help to form a child health strategy in Europe.

Mental health is a complex Public Health challenge, especially youth. A better understanding of factors that contribute to youth mental health and reduce the burden of youth mental health conditions such as executive and emotional functioning is needed to develop primary and secondary prevention interventions. One of the main challenges for better understanding mental health of youth is the complexity and diversity of exposures that individuals experience throughout their lifetime. There is a wide range of factors in the environment, and individuals are exposed to different combinations of external factors depending on their location, occupation, and lifestyles. These factors include physical (e.g., noise and indoor and outdoor air), chemical and social factors (e.g., neglect and abuse, relationship conflicts) based on the exposome framework. The exposome is a guiding framework for the multi-country study EARLY involving Albania, Belgium, Germany, Israel, Moldova, Portugal, Romania, Serbia, Spain, and Switzerland. EARLY is one of the first projects to theoretically explore and empirically investigate youth mental health in line with the exposome framework. We aim to identify factors influencing youth mental health with validated exposure measures. An exploratory list of measures was collected in Albania, Belgium, Germany, Israel, Moldova, Portugal, Romania, Serbia, Spain, and Switzerland. The measures vary widely. Besides the variation, there is still a lack of standardized methods for measuring environmental exposures. Limitations of measures affect reliability and validity. Therefore, an overview of available assessment methods and steps toward improving measures will be discussed in this talk.

2.X.1. Sleep Health Disparities across the life-course: from research to public health policy

Abstract citation ID: ckae144.753

Organised by: EUPHA-CHR, Western University (Canada)
Chair persons: Saverio Stranges (EUPHA-CHR), Dayna Johnson (USA)
Contact: saverio.stranges@uwo.ca

Poor sleep health is a recognized common problem across the life cycle, globally. Factors that contribute to this problem include the demands of a "Western" lifestyle (urgency, productivity), economic stressors, social and environmental determinants of health, and global crises including international conflicts, political tensions, and climate change. There is a growing consensus that optimizing sleep health should be a public health priority because poor sleep patterns are a modifiable risk factor for myriad health outcomes, such as cardiovascular disease, diabetes, cancer, cognitive decline, mental illness, and early mortality. In Canada, a nationwide sleep consortium funded by the Canadian Institutes of Health Research (CIHR) was recently formed with a mandate to generate new knowledge that will inform clinical practice and support public health initiatives to deliver resources where they are most needed. The proposed workshop organized by the Chronic Disease EPH section will start with a general overview of the impact of sleep health disparities across the life-course, from childhood to older age, as well as discuss evidence-based public health approaches to promote sleep hygiene and mitigate the risk of adverse health outcomes, including chronic disease (Saverio Stranges). It will be followed by three presentations to address the root causes of sleep health disparities and their impact on chronic disease (Dayna Johnson); participatory research with families and care providers on infant sleep intervention development (Elizabeth Keys), and strategies to address common sleep disorders among middle-aged and older adults (Tetyana Kendzerska).

Key messages:

- Sleep health disparities are a neglected public health issue.
- Optimizing sleep health is both a clinical and public health priority, as sleep patterns represent a modifiable risk factor for a range of adverse health outcomes.

Abstract citation ID: ckae144.754

Sleep health across the life cycle: an unmet and neglected public health priority

Saverio Stranges
Department of Epidemiology and Biostatistics, Western University, London, Canada
Contact: saverio.stranges@uwo.ca

The presentation will set the stage on the central role of sleep health across the life cycle. Despite the large body of evidence on the importance of poor sleep behaviors as a modifiable risk factor for several adverse health outcomes, sleep health is still an unmet and neglected issue in public health policy, especially in the European context. Sleep problems are widespread and potentially affect everyone, from childhood to adult age. In addition, sleep health disparities represent a major source of health inequities across marginalized and high-risk population subgroups, such us people from low socio-economic status, women, refugees and immigrants, shift workers, people living with physical and mental illness. There is an urgent need to promote evidence-based health promotion and public health policy to enhance sleep health both in the general population and high-risk subgroups.

Abstract citation ID: ckae144.755

Social and environmental determinants of sleep health disparities

Dayna Johnson
Department of Epidemiology, School of Public Health, Emory University, Atlanta, USA
Contact: dayna.johnson@emory.edu

Sleep is not equitable. Historically minoritized individuals have a high prevalence of sleep disorders and adverse sleep health. Research supports that social determinants of health are contributing to sleep health inequities. Further, sleep is socially patterned. Neighborhoods with high rates of crime, violence, disadvantage, pollution, inopportune light exposure, and noise, where historically minoritized individuals are most likely to live are associated with adverse sleep health and sleep disorders. Social determinants including discrimination, racism, socioeconomic status, lack of access to care are associated with adverse sleep health, particularly among minoritized individuals. While there is an abundance of evidence identifying risk factors for adverse sleep health, evidence also supports factors that promote healthy sleep. A small but growing literature supports that neighborhood social environment is associated with healthy sleep and may be avenue for addressing sleep disparities. Dr. Johnson will present epidemiologic data on the social and environmental determinants of adverse sleep health using a socioecological framework and discuss the mechanisms by which these factors are contributing to sleep disparities. The goal is to identify these factors, and how they can be utilized to address sleep health disparities.

Abstract citation ID: ckae144.756

A call to action about promoting healthy sleep among children

Elizabeth Keys
School of Nursing, University of British Columbia, Kelowna, Canada
Contact: elizabeth.keys@ubc.ca

Infancy is an ideal time to engage parents in foundational sleep health promotion, as many parents have concerns about infant sleep. However, recent work suggests most Canadian public health resources on infant sleep does not meet clear communication criteria and that these resources often only focus on sleep safety, rather than broader sleep health. Information is also limited with respect to how parents can manage infant sleep difficulties. While eHealth intervention programs can increase the accessibility of evidence-based pediatric sleep health information, recent parental feedback indicates that usability, personalization, and flexibility are key factors in facilitating use. Additional co-design workshops with care providers and parents provided critical guidance on the need to develop more inclusive infant sleep interventions, consistent with previous literature. This guidance suggests infant sleep interventions should be culturally humble and non-judgmental, inclusive of parenting partners, and provide credible, timely, and meaningful information.

Abstract citation ID: ckae144.757

Strategies to address common sleep disorders among middle-aged and older adults

Tetyana Kendzerska
Department of Medicine, University of Ottawa, Ottawa, Canada
Contact: tkendzerska@toh.ca

Obstructive sleep apnea (OSA) is an underdiagnosed and prevalent condition in middle-aged and older adults, with a disproportionate burden of OSA in marginalized populations. Lack of appropriate and timely treatment puts many at risk of poor quality of life, comorbidity, motor vehicle crashes and increased health care utilization. Furthermore, social and environmental disparities were acknowledged as contributing to sleep health disparities, OSA health literacy and adherence to OSA treatment. This presentation will overview the social and environmental determinants of OSA prevalence and management. The presenter will also cover strategies to improve access and waiting time for OSA diagnosis and treatment in middle-aged and older adults, such as screening for OSA in general and marginalized populations, alternative at-home OSA detection solutions, involvement of alternative care providers in OSA care, alternative OSA targeted therapies, including accessible self-administered interventions, health equity interventions targeting OSA, and promotion of sleep-centered lifestyle approaches, including weight loss, diet and exercise.

2.X.2. Cancer Screening Across the Life Course and Surveillance Bias

Abstract citation ID: ckae144.758

Organised by: #PopHealthLab University of Fribourg (Switzerland), Western University (Canada), EUPHA-CHR
Chair persons: Arnaud Chiolero (Switzerland), Saverio Stranges (EUPHA-CHR)
Contact: arnaud.chiolero@unifr.ch

The proposed workshop organized by the Chronic Disease EPH section will start with an overview of the impact of a life course perspective on cancer prevention and screening strategies, in the context of aging populations and fear of increasing health inequity. It will be followed by three presentations to address issues of cancer screening inequalities, low-value cancer screening, and cancer surveillance bias due to screening.

Key messages:

- Due to population aging, the burden of cancer increases and calls for new cancer prevention and screening strategies.
- Cancer screening strategies must be adapted among older adults and designed to prevent inequities.

Cancer prevention over the life course

Arnaud Chiolero
Population Health Laboratory #PopHealthLab, University of Fribourg, Fribourg, Switzerland
Contact: arnaud.chiolero@unifr.ch

Within a life course epidemiology framework, the etiology and prevention of cancer are informed at different ages from a social, behavioral, and biological perspective (1). Due to population aging, the burden of cancer increases and calls for new cancer prevention and screening strategies. In this introduction, we will discuss the issues of cancer screening among older adults and inequalities in screening uptake, and how vulnerable population preventive strategies can reduce these health inequities.

Monitoring inequities using routine administrative data: a case study of cancer screening in Ontario, Canada

Saverio Stranges
Schulich School of Medicine & Dentistry, Western University, London, Ontario, Canada
Contact: saverio.stranges@uwo.ca

Routine cancer screening is a critical primary care service to reduce cancer morbidity and mortality, through early detection, diagnosis, and treatment. We evaluated longitudinal changes in socioeconomic inequities in cancer screening in Ontario, Canada, by using linked provincial health administrative databases including 15.9 million records eligible for cancer screening. The rate of colorectal cancer screening increased between 2011 and 2020 (54% to 62%) with a reduction in the indices of inequity (slope index, SII: from 0.36 to 0.33; relative index of inequity, RII: from 0.69 to 0.54). However, the rate of cervical cancer screening decreased (from 76% to 68%), particularly in deprived areas (RII increasing from 0.47 to 0.54). Access to cancer screening is a challenge in deprived areas. Understanding the socio-economic determinants in access to screening across the life course can help develop tailored interventions to increase health equity.

Socioeconomic drivers of low value screening

Frerik Smit
Population Health Laboratory #PopHealthLab, University of Fribourg, Fribourg, Switzerland
Contact: sm.frerik@gmail.com

Low-value care brings minimal or no benefit to the patient and is a growing concern for healthcare systems. In this presentation, we will discuss the issue of low-value cancer screening, its frequency, and how it is socially patterned. The general population, policymakers, and healthcare providers expect a lot from cancer screening, while the actual absolute benefits are generally relatively low. In addition, screening practice often does not follow recommendations regarding the frequency of testing or the ages at which to start and to stop, and many screenings providing no benefit are commonly performed. Addressing low-value screening is key for evidence-based population health management and prevention.

Cancer screening and surveillance bias

Stefano Tancredi
Population Health Laboratory #PopHealthLab, University of Fribourg, Fribourg, Switzerland
Contact: stefanotancredi@gmail.com

We will discuss the issue of surveillance bias, which arises when differences in the frequency of cancer are due to changes in screening and detection strategies rather than to differences in the true occurrence of cancer (2). This bias hampers the surveillance of scrutiny-dependent cancers, such as thyroid and prostate cancers and melanoma, leading to misinterpretations of cancer trends. Moreover, it can lead to the misinterpretation of potential risk factors for cancer occurrence, such as socioeconomic status.

2.Y.1. Communication in participatory health research with refugees and migrants

Abstract citation ID: ckae144.763

Organised by: ICPHR, EUPHA-MIG
Chair persons: Bernadette Kumar (EUPHA-MIG), Ana Gama (Portugal)
Contact: ana.gama@ensp.unl.pt

Innovative approaches are needed to transform public health research and address health inequities. Participatory Health Research (PHR) is one such approach, which aims to maximize the participation of those whose life or work is the subject of the research in all stages of the research process. PHR has advantages for both research outcomes, including increased relevance, meaningfulness and impact of research, as well as for those involved, in terms of ownership and empowerment to address their health priorities. PHR with migrants has potential to reduce health inequities through the active involvement of migrants in research about their health. In a framework for refugee and migrant health in the WHO European Region, MacFarlane et al. (2022) recommend the research field of migration and health to adopt PHR as the norm, for ethical reasons and to support effective research-policy-practice translation. PHR with migrants is increasingly used but is still rare and adhoc in the field of migration health research. There are also potential practical and ethical challenges that warrant critical reflection. One persistent challenge is communication, where differences in culture, language and knowledge areas need to be considered in multiple ways, for example, in the development of participatory partnerships, in the conduct of data collection that takes place as a result of such participatory partnerships and in dissemination processes. The aim of the workshop is to share different approaches on PHR with migrants and propose solutions to common challenges in communication. The workshop will be structured in a first part where presenters will draw upon their experience in PHR with refugees and migrants covering a broad range of topics relating to communication, and a second part of open discussion with presenters and the audience. The workshop will address two key questions: what challenges have we experienced, and lessons learnt.

Anne MacFarlane presents emerging evidence about music and singing as culturally attuned arts based methods that can create innovative opportunities for communication for partnership building, fieldwork and dissemination. Ana Gama presents on using idea-generation workshops with vignettes representing migrants with diverse health-literacy profiles and its potential to address communication challenges.

Key messages:

- Participatory health research with migrants warrants critical reflection around communication, ethics and partnership-building.
- In participatory health research, using innovative and creative methods can create opportunities to overcome communication barriers and build meaningful collaborations.

2.Y.2. International Health Regulations – role on disease control and global challenges

Abstract citation ID: ckae144.764

Organised by: Universidade Nova de Lisboa (Portugal), WHO Collaborating Center for Health Workforce Policies and Planning
Chair persons: Rita Sá Machado (Portugal), Carina Silva (Portugal)
Contact: carina.castro.silva@ulsge.min-saude.pt

The International Health Regulations (IHR) are a legal instrument aimed to control infectious disease epidemics worldwide and that makes countries accountable for monitoring and promptly notifying the World Health Organization (WHO) of events that are likely to represent a public health emergency. The 196 signatory countries are bound by this international agreement. This workshop aims to present evidence on the role and updates of the IHR as a framework for global health preparedness. It will do that by exploring the main components of the IHR and their practical implications for public health practice, with particular emphasis on their function in preventing, detecting, and responding to cross-border public health threats. The workshop will feature four short presentations, in a total of 15 minutes, beginning with three presentations showcasing the findings of literature reviews covering various aspects of the IHR. These topics include the main challenges to implementation, the effectiveness of the IHR during the COVID-19 pandemic, its relevance to travel medicine and zoonosis prevention, and strategies for controlling vector-borne diseases. The last presentation will delve into the challenges and opportunities associated with implementing the IHR at both national and international levels, in the context of the proposals from the Working Group on Amendments to the International Health Regulations (2005). Throughout the workshop, emphasis will be placed on understanding how the IHR facilitate collaboration and coordination among countries during health emergencies, as well as the importance of capacity-building, information sharing, and multisectoral collaboration. This structure will allow for discussion aimed at areas for improvement to the IHR, especially in the context of its revision process and global health governance. We believe the added value of this workshop will be creating a platform for critical analysis and dialogue, sharing insights into the evolution of the IHR, ongoing debates, controversies, and emerging trends in global health regulations.

Key messages:

- This workshop provides a platform for in-depth exploration of the IHR's role in global health preparedness, offering evidence on its components and practical implications.
- Through analysis of challenges and discussions on disease control, attendees will engage in critical dialogue aimed at improving the IHR and enhancing global health governance.

The International Health Regulations (IHR) govern how 196 countries and the World Health Organization (WHO) collectively manage global disease spread while preserving international travel and commercial trade. The COVID-19 pandemic set an unprecedented challenge to the IHR commitments. To address this gap, two scoping reviews were conducted: one identifying global challenges in IHR implementation and the other analyzing challenges, successes and limitations of the IHR during the COVID-19 pandemic. The scoping reviews followed Arksey and O'Malley's framework and PRISMA methodology, utilizing the PubMed, Medline, World of Science, SCOPUS, and Google Scholar databases, plus backwards citation chaining. Data selection and analysis were guided by pretest forms. From 128 articles screened, 52 met inclusion criteria for the IHR implementation review. 135 challenges were identified, in these categories: (1) requirement of financial and technical resources, (2) lack of enforcement and accountability mechanisms, (3) need for rules clarification, (4) deterrents to reporting, (5) inadequate governance, (6) insufficient cooperation between countries, (7) sovereignty issues, (8) scarcity of guidance and technical support from WHO, (9) lack of inclusion of roles for relevant non-state actors, (10) conflicts and emergencies. In the COVID-19 review, 15 articles were included. Although the role of the IHR during Health Emergencies was acknowledged, most countries faced limitations in its implementation during the pandemic. Key lessons included reinforcing the global health security strategy, reviewing the IHR to address current challenges and strengthening countries and states' commitment to resolutions compliance. The ongoing debate over IHR updates confirms the need for its revision to safeguard global health. A more effective response grounded on the IHR is needed to face upcoming and expected events of COVID-19's magnitude and severity.

Trade interferes with the number and frequency of new species introduced and the possibility of these remaining and dispersing, impacting disease transmission dynamics. The International Health Regulations (IHR) establish the need to ensure veterinary care for animals affected by infectious diseases that pose a risk to public health through isolation, treatment and the demanding of other services. Concurrently, globalisation and increased travel have reshaped disease epidemiology, and new and old pathogens threaten to up-end the balance of travel. Two scoping reviews were conducted to explore the IHR's role in animal monitoring and control and its interface with travel medicine. The scoping reviews followed Joanna Briggs Institute (JBI) framework, utilising the PubMed, B-on, Biomedcentral, ScienceDirect, Medscape, Medline, World of Science, SCOPUS, and Google Scholar databases. English publications and grey literature were included. Regarding animal control, 21 articles were analysed. Most focused-on zoonosis prevention and addressed the international context and highlighted the international significance of applying the IHR for animal monitoring and control, addressing all core capacities. As for travel medicine, other 21 articles were included, highlighting applications in vaccine management, notably for COVID-19 and yellow fever. The IHR and its core capacities are essential in the monitoring and control of animals, with the One Health approach and effort sharing being the ideal method to prevent and respond to outbreaks and pandemics of zoonotic diseases. On the other hand, there is sparse literature about the integration of travel medicine within the IHR framework. Lack of standardisation in methods to evaluate the impact of the IHR is an issue. There's a need for closer collaboration between clinical practice and legal frameworks to enhance global health preparedness.
